W. S., bbl., 85c; cs., 90c; Neats-foot Oil, pure, bbl., 75c; cs., 80c; Sperm, crude, 50@60c; Natural White, 70c; Bleached, do., 75c; Whale Oil, cs., 50@55c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2.00 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Triple tape, $3.60 per 1000 feet; double tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11c ℔ set; 14 oz., 40s., 10c.

COAL. — San Francisco, coast, yard prices: Wellington, $8.00; Seattle, $6.50; Coos Bay, $5.50; Southfield, $8.00. Cargo lots, Eastern and foreign: Wallsend, $7.50; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8.00; Cumberland, $13.00; Cannel, $8.50; Welsh Anthracite, $13.00; Rock Springs, $8.50, long ton; Colorado Anthracite, $14.00. Coke, $10.50 per ton in bulk, $13.00 in sacks; Sunnyside, $8.50, long ton.

CHEMICALS. — Cyanide of potassium, 98%-99%, jobbing, 23@24c ℔ lb.; carloads, 23@23½c; in tins, 30c: soda ash, $2.00 ℔ 100 lbs.; hyposulphite of soda, 3(@3½c per lb.; caustic soda, in drums, 3@3½c ℔ lb.; Cal. s. soda, bbls., $1.20@1.40 ℔ 100 lbs.; sks., $1.05; chlorate of potash, 12@13c; nitrate of potash, bbls., 10c; caustic potash, 10c in 40-lb. tins; roll sulphur, 2¼@2¾c; powdered sulphur, 2@3c; flour sulphur, French, 3½@3½c; alum, $2.00@2.25; California refined, 1¾@2c; sulphide of iron, 8c ℔ lb.; copper sulphate, 5¼@5¾c; chloride of lime, spot, $2.50@2.75; sulphuric acid, in carboys, 66% B, 1¾@2c ℔ lb.; nitric acid, carboys, 8c ℔ lb.

BONE ASH.—Extra No. 1, 5@6c ℔ lb. No. 1, 4@5c.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 6c; less than 500 lbs., per lb., 7c; in 25-lb. tin pails, ½c ℔ lb. above keg price; in 1 and 5-lb tin cans, 100 lbs. per case, ½c. per lb. above keg price. Dry Lead—In bbls., 1 ton and over, 6c; do. in kegs, 6½c.

RED LEAD.—500 lbs. and over at one purchase, ℔ lb., 6½c; less than 500 lbs., 7c.

LITHARGE.—Pure, in 25-lb. bags, 8@9c ℔ lb.

BORAX.—Concentrated, 6@7c ℔ lb; powdered, 8@10c; fused, 20@25c; crystal, 7c; calcined, 25c.

MANGANESE.—Pure, ℔ lb., 60c.

SODIUM.—Metal, ℔ lb., $1.00.

BISMUTH.—Subnitrate, ℔ lb., $1.75.

MERCURY.—Bichloride, ℔ lb., 90c.

MOLYBDENUM.—$2.00 ℔ lb.

CHROMIUM.—90% and over, ℔ lb., $1.00.

PHOSPHORUS.—American, ℔ lb., 75c.

SILVER.—Chloride, ℔ oz., 90c@$1.00; nitrate, 55c.

ALUMINUM.—No. 1., 99%, small lots, 37c ℔ lb.; 100 lbs., 35c; 1000 lbs, 34c; ton lots and over, 33c, Pittsburg. No. 2, 90%, small lots, 34c; ton lots and over, 31c, Pittsburg.

URANIUM.—Oxide, ℔ lb., $3.50.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

STEP-LADDERS.—No. 741,872. Oct. 20, 1903. J. A. Ashley, Yuba City, Cal. This invention consists in a bolt for securing the parts of step-ladders together consisting of a threaded cylindrical portion adapted to pass through the side of the ladder, a vertical portion to pass through the step, said portion being made segmental in cross section and wider than the cylindrical portion and a transverse head having depressed ends.

DENTAL DAMS.—No. 741,890. Oct. 20, 1903. H. Craigie, San Francisco, Cal. One-half assigned to J. W. Rooch of same place. This invention relates particularly to an improvement in rubber dams as used in dentistry. It consists as a new article of manufacture in a perforated rubber dam having annular embosses upon its surface surrounding the perforations, the walls of said perforations being beveled.

MOWING MACHINE.—No. 741,874. Oct. 20, 1903. J. W. Barnes, San Francisco, Cal. This invention relates to improvements in mowing machines employing an endless cutter in contradistinction to those in which a reciprocating cutter bar is used. Its object is to provide, among other things, a simple, efficient, durable and positively operated device in which the speed of the cutter may be regulated according to the character of the grain and the rate of travel of the team.

SIDEHILL HARVESTING MACHINE.—No. 741,876. Daniel Best, San Leandro, Cal. This invention relates to that class of machinery designed for cutting, threshing and cleaning grain, in which the machine is mounted upon wheels and adapted to travel over the field in which the grain stands, being propelled by either animal or mechanical power. It consists in a means for changing the position of the bearing wheels relative to each other in such manner that the threshing and cleaning mechanism of the apparatus may be maintained substantially level in the direction transverse to the line of travel and when the machine is traveling upon sidehills or inclined ground, which would otherwise throw the said mechanism out of level.

APPARATUS FOR ASSORTING AND DISTRIBUTING FRUIT.—No. 741,928. Oct. 20, 1903. C. Rayburn, Lindsay, Cal. The object of this invention is to provide suitable means for the rapid handling of assorted fruit by affording accommodation for a greater number of packers than it has heretofore been generally possible to employ, at the same time economizing floor space.

WHEELS.—No. 741,877. Oct. 20, 1903. Daniel Best, San Leandro, Cal. This invention relates to the class of vehicle wheels, and especially to those wheels which are to be used with heavy vehicles, such as harvesters, traction engines, road locomotives and the like, and the object is to so construct the wheel hub as to enable the spokes to be readily inserted and removed without bending, and to insure them against accidental displacement or removal from the slots or channels.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific Coast inventors:

FOR THE WEEK ENDING OCTOBER 20, 1903.

741,994.—INSULATOR—Anderson & Bebler, Los Angeles, Cal.
741,872.—STEP LADDER—J. A. Ashley, Yuba City, Cal.
741,874.—MOWING MACHINE—J. W. Barnes, S. F.
741,876.—HARVESTER—D. Best, San Leandro, Cal.
741,877.—WHEEL—D. Best, San Leandro, Cal.
741,764.—HONEY COMB FRAME—J. W. Brown, Los Angeles, Cal.
742,003.—TABLE—G. C. Calentine, Tacoma, Wash.
741,890.—DENTAL DAM—H. Craigie, S. F.
741,892.—CRUSHING ROLLS—W. G. Dodd, S. F.
742,029.—WATCH HOLDER—Hohmann & Rosenfeld, San Diego, Cal.
741,793.—PLOW POINT—T. J. Hubbell, Los Angeles, Cal.
741,794.—BEET ROOT CUTTER—T. J. Hubbell, Los Angeles, Cal.
742,119.—OIL BURNER—R. M. Jackson, Los Angeles, Cal.
742,038.—RANGE FINDER—J. W. Kern, Portland, Or.
741,680.—STOVE—H. Lang, Oakland, Cal.
741,806.—LOCK WASHER—W. C. Matteson, Stockton, Cal.
741,921.—HOPPLE—J. H. Miller, Dora, Or.
741,925.—CASING—R. S. Oiler, Los Angeles, Cal.
742,057.—NUT LOCK—Owen & Shaw, Spokane, Wash.
741,705.—ROLL PAPER PRINTER—A. E. Palmer, S. F.
741,926.—PUMP—C. L. Parker, Los Angeles, Cal.
742,062.—BAG MACHINE—Philbrick & Coulter, Portland, Or.
741,882.—FARM GATE—S. Purvine, Salem, Or.
741,928.—FRUIT GRADER—C. Rayhurn, Lindsay, Cal.
741,722.—TOOTH BRUSH.—Ryder & Reynolds, Redding, Cal.
741,725.—CONCENTRATOR—E. Schutz, S. F.
741,731.—LOADING CARS—S. K. Smith, Roslyn, Wash.
742,078.—HARVESTER—L. Spencer, Island City, Or.
741,819.—ARTIFICIAL LEG—C. E. Stone, Port Townsend, Wash.
741,736.—GAS JET HOLDER—E. B. Stoner, Astoria, Or.
741,850.—ROW LOCK—J. R. Supple, Oakland, Cal.
742,135.—REFLECTOR—H. H. Taylor, San Jose, Cal.
741,738.—PROJECTILE—H. E. Thomas, S. F.
741,740.—COLLAR BUTTON—J. W. Tinch, Los Angeles, Cal.
741,862.—OIL DISTRIBUTOR—T. F. White, Chino, Cal.
741,867.—OIL BURNER—G. E. Witt, S. F.

THERE'S NO REASON

for you to pay high lubricating oil bills when you can cut them in half with a

CROSS OIL FILTER.

It filters oil you usually throw away, making it fit to use again and again. You may try one 30 days, and if not exactly as represented return at our expense.

"The Cross Oil Filters purchased from you are giving good satisfaction." W. Va. Pulp & Paper Co., Piedmont, W. Va.

Largest Mfrs of Oil Filters in the World.
Akron, Ohio, U. S. A.
Also supplied by Engine Builders, Oil Companies and Power Contractors.

SITUATIONS WANTED.

AN ASSAYER AND CHEMIST WITH TWELVE years' experience in mining, milling, smelting and cyanide work desires a position. Best of references. Address Box 379, Central City, Colo.

CYANIDE CHEMIST WHO HAS SUCCESSfully managed cyanide plants will be open for engagement in November. Ten years' experience in different countries. Reasonable salary. Address "Reliable," care of this office.

EXPERIENCED MILLMAN WISHES POSItion. Address Box 117, Oroville, Cal.

FIRST-CLASS STATIONARY ENGINEER; 25 years' experience in mills and mines. Address Frank Wagner, Brooklyn Hotel, San Francisco.

MINING ENGINEER DESIRES POSITION AS Manager or Superintendent. Good executive ability. Extensive experience in mining and treating large bodies of low grade refractory gold ore. South Africa or West Australia preferred. Address "Telluride," this office.

MINING ENGINEER AND METALLURGIST, with sixteen years' of practical experience as manager, superintendent and consulting engineer of mines and mills, desires position on or after November 1st. Speaks Spanish fluently. Address P. O. Box 77, Durango, Mexico.

MINING ENGINEER OF GOOD STANDING, with twelve years' experience in mines and mills, wants position as expert. School of Mines graduate. Address V. X., this office.

SITUATION AS MILLMAN OR CHARGE OF small mine, after November 15th, by middle-aged man. Over twenty years' experience in mine and mill. All round worker. Nine years with present company. Wish to make change. Good references. Address "Millman," care of Mining and Scientific Press.

SUPERINTENDENT WANTS POSITION WITH substantial company. Practical miner, millman, assayer and cyanide expert. Address Supt., this office.

WANTED, BY A FIRST-CLASS CYANIDE Chemist and Assayer having had ten years' experience in the construction and management of plants in some of the main gold and silver camps of the West, a position with a reliable company. Satisfactory work guaranteed. Highest references given. Moderate salary. Address "Cyanide Chemist," care of Mining and Scientific Press.

WANTED BY AN EXPERIENCED MINING Engineer and Manager, a position as mine manager in gold, silver or copper proposition, with a first-class corporation. Have had 35 years' experience in U. S. and Mexico; prefer Mexico. Speak Spanish, German, French and English. Am well acquainted with Mexico, and am employed now. Desire a change between November and January 1st, 1904. Salary expected not less than $5000 per annum. Can furnish the best of reference. Address "Mine Manager," care of Mining and Scientific Press, San Francisco, Cal.

WISH POSITION AS SUPERINTENDENT OF a mine, assayer, millman, steam engineer, or tool sharpener. Fifteen years' experience. Have good assay outfit. Address J. L. WETMORE, Rich Gulch, Calaveras Co., Cal.

YOUNG MAN DESIRES POSITION AS MILL Man. Has had six years' practical experience in amalgamating and concentruting, and a fair knowledge of the operation of engines. Will give best of references upon application. Address C. L. B., care this office.

HELP WANTED.

WANTED.—An experienced, active Foreman for a California quartz mine. Must be thoroughly familiar with mining both above and below ground, and mining machinery. Apply, with references, to Room 44, No. 230 Montgomery St., San Francisco.

Mine Investment in Mexico.

Many investors are now looking toward Mexico with a view to acquiring mining property there. While undoubtedly there are many opportunities in that Republic, it should be remembered that good mines—by which is meant mines that can be profitably worked—are probably not more numerous in Mexico than in the United States. The Mexican mining laws, which, on the whole, are good and equable laws, differ materially from our own, and no American citizen should make mining investment in Mexico without being fully informed concerning the Mexican mining code. There is a system of procedure which must be rigidly adhered to, or the concession may be lost to the investor, and it is needless to say that the more valuable his mine proves to be, the greater the danger to his title if every particular be not observed. If a large investment in plant is contemplated, it is the more important that all the formalities of the law be complied with, and that the system of taxation be fully understood and provided for. In former years, before the revision of the mining laws, foreign investment often proved disastrous for other reasons than the lack of value in the mines; but more recently a large amount of English and American capital has gone into Mexico, and some large and successful mining operations are the result. There are many new districts being opened up, but the old districts are still the favorite field for the investor. There are many mines in Mexico which have been successfully worked by native miners in the past—some of them a century or more since—but the encountering of water, or base ores, or some other hardship, usually resulted in a cessation of all operations, while the owner would devote his attention to another vein in the same or some other district. The chief cause of stoppage was generally the working of the vein to the water level. In such mines the new investor doubtless stands the best chance for success, though the equipment would call for a larger investment than would be required if it were a tunnel proposition. Many years of experience has proved that a Mexican miner can work a mine by means of a tunnel as well as anyone else, in his own peculiar way, and he has also demonstrated his ability to successfully operate a dry mine by means of shafts—the ore being carried up hundreds of feet through the workings on the backs of half-nude men who, barefooted, climb the notched posts, called by American miners "chicken ladders," until they reach an adit level, through which they pack ore to daylight.

Montejus, Greenback Cyanide Mill, Oregon. (See page 306).

Stope Worked by Square Set Method in Mexican Mine, Showing Sprags to Roof.

There is no phase of mining in dry, good-standing ground, with which the Mexican miner is not familiar, except timbering by square set method or some of the other more modern schemes for stoping, such as caving and filling, etc. In view of these facts, investors should approach with caution old Mexican mines which are idle, but which are represented as still having fabulous value, for the mine which a Mexican could not make pay with his low costs for labor and methods requiring a minimum of supplies, is likely to prove a financial burden in the hands of American investors, who put into the enterprise large capital with modern equipment and methods. There are doubtless many exceptions to be found, but this word of caution is certainly not misdirected, for the Mexican miner has shown that his judgment of mining property is excellent.

Those mines, which are in operation and profitable under native management, should under a competent American management continue to pay, and those mines which have been good above the water line would doubtless prove valuable below it. It is these two latter classes of mines that form the best class of mine investment in Mexico, possessing fewer elements of failure than untried propositions or those which have failed.

Industrial Conditions and the Gold Miner.

Eastern iron manufacturers are strenuously endeavoring to readjust, as far as possible, the disorganized condition of the industrial world, of which their operations are the pulse. A further curtailment of output is deemed necessary to restore the pig iron market to a normal condition. On the 2nd inst. a number of the largest merchant blast furnace operators of the East met at Philadelphia, Pa., and decided to reduce production at least 20% further, having already reduced the output materially during October. Something will have to be done in the right direction to re-establish industrial activity. The great trusts formed three or four years ago did much, no doubt, to promote unusual progress in the commercial and industrial world, but some of these great orgauizations have come to grief and investors are becoming timid. This state of affairs, coupled with the demands of organized labor, have so unsettled industrial conditions that careful men are seeking some way to re-establish confidence and bring about a reaction in the right direction. The past four years have afforded unprecedented opportunities for a few men to show what can be done by skillful manipulation of millions of dollars of other people's money, in building great fortunes and reputatious for themselves.

Of all the industries affected by the present condition of the industrial world mining feels it most heavily, particularly iron, copper and coal mining. Gold mining, however, continues in its even course almost unaffected by either the prosperity or the reverses of the country. If industrial couditions generally are sluggish, and times are hard, the gold miuer profits by it; if he is already established in business, he can then buy machinery aud supplies at a comparatively low figure. If, however, he desires to secure money to equip and develop a new euterprise, he usually finds difficulty in raising the uecessary funds. When the country is prosperous, as it has been since the recent Spanish war, all supplies are high, and machinery particularly is much more expensive than a few years ago. So heavy have been the demands for structural iron and steel that the iron mines have until lately scarcely been able to keep up with the constantly increasing demand. In view of this condition much old machinery has been remodeled into new, or has been melted in the furuaces to supply material for constructing new machinery designed on modern lines. Gold always finds a ready market at a uniform price, and no matter what the condition of the times, the gold miner feels secure.

The Difficulties of Concentration.

It has been the constant aim of the inventors of concentratiug machines to plan a device which will effect a complete separation of the valuable mineral particles of high specific gravity from the lighter gangue of relatively small value. The various kinds of conceutrating devices are not numberless, but certainly numerous. They comprise inclined tables, with riffles and without. Some are stationary, others have a vibratory movement imparted in a variety of ways on the various machines. There are circular concentrators and rectangular ones, triangular and rhomboidal, flat and coue shaped, and other forms. The variety of shape, size and mechanism is almost as great as the number of men who have schemed, aud thought, and experimented to reach perfection in this class of metallurgical machinery. Some are simple, self-contained machines, and others comprise several devices which work together, to accomplish the same purpose.

All concentrating devices, of whatever type, from the bullock skins of the old Braziliau miners, to the most refined moderu mechanism, depend upon the same uatural law—the attraction of gravitatiou for success, and all, except a few of special design, which are pueumatic iu operatiou, employ water as a concentratiug medium.

Mineral particles discharged from a stamp battery, or other crushing or pulverizing machines, have a great relative difference in size and shape as well as of gravity, and it is not reasonable to pre-suppose that a single coucentrating device will be capable of effecting a complete separation of both the coarsest and finest particles of sulphide ore, or other valuable mineral, of high specific gravity, from the particles of gangue, which also vary greatly in size, though uudoubtedly some machines perform work of this class with which little fault can be found. The efficiency of auy conceutrating machine cau be increased by sizing the pulp sent to it from the mill. The hydraulic sizing devices are also various in shape, mostly patterned after the spitzkasten or spitzlutte, but all, when properly proportioned and adjusted to the volume of material being treated, bring about a division of the particles of the pulp, which, to a great extent, is regardless of specific gravity. The coarse material passes out at the bottom of the siziug machiue, the fine overflowing at the top. These two streams may then be divertcd to a separate machine, each adjusted to the particular sort of pulp, and a much more satisfactory saving of values results, although the same condition as to relative size of particles still exists, but in a lesser degree.

The sizing and concentration may be carried to a limit approaching perfection, but when this condition is reached the limit of economic commercial success has geuerally been passed. In concentrating ores on vibrating tables, or on belt machines, the persoual equation is often a large one. The best work is not always done on the best machine, for the reason that two men will often get very different results on the same machine treating the same class of pulp. A slight change of speed of travel or in the number of vibrations of a machine adjusted to do its best work with the material under consideration, or the addition to or diminution of the supply of clear water will at once have a noticeable effect on the product, but the man in charge is not always alert, and when he is not either tailings run up in value or dirty coucentrates result. Constant vigilance is one of the first essentials in running coucentrating machines. The man in charge may have the necessary knowledge derived from experience, but he must also be vigilant and quickly detect and correct iu the result of his work by the prompt application of the proper remedy.

Modern Methods in Ancient Mines.

The silver mines of Cerro de Pasco, Peru, have loug been famous in the mining annals of the world. A hundred years ago Humboldt reported the output of those miues to exceed $5,000,000 in gold aud silver annually. The mines continued to produce large amounts of the precious metals for mauy years after Humboldt's visit, but of receut years, until within the past decade, the mines have beeu worked in a somewhat desultory manner. Within this latter period, however, American capital has been reopening thees mines and it is uow stated that a great reduction plant, costing $3,000,000, is to be built there to treat the great quantity of ores left by the former workers, as well as that opened by the recent more extensive and deeper development. The principal metal now sought is copper, the gold and silver once constitutiug the main output of the mines now beiug secondary and becoming a by-product of the operatious. These mines are all located uear the summit of the Andes, at au altitude of 15,000 to 16,000 feet above the sea—several thousand feet higher than the highest mining town iu the United States. The Americans employed iu supervising positions do little manual labor, that being a physical impossibility with the greater number, but the natives of those high plateaus and ranges are said to be efficieut workmeu under competent direction, apparently sufferiug uo iuconvenience at that great altitude. This rejuvenated enterprise simply forms another evideuce of the progressive American spirit and the possibilities where modern science is applied in mining. The miues of Peru are the oldest worked by white men on the American continent, being operated by the Spaniards about 1534, during the conquest of Pizarro. Prior to this some of them had beeu extensivcly opened under the reign of the Incas.

Claim and Location.

As the seasou of the year has arrived when much assessment work must of necessity be done on mining locations, to secure possessory right through the year 1904, it may be of iuterest to note the meaning in the law of the words claim and location. There is an essential difference between claim aud location—at least in a legal sense, as applied to miuing property, prior to patent. The word claim, as used in the Federal statutes, is applicable to a single location or to a group of contiguous locations. If the miner makes a single location, it constitutes his "claim," and in this case there is no essential difference between location and claim; but if he subsequently buys an adjoining unpateuted location, on either side of his original discovery location, the three locations then constitute his claim; but in such case he assumes the responsibilities of the locators of the two adjoining locations, and he must perform the annual assessment work for the three claims as though they were still separate, though it is optional whether he do the work on a siugle locatiou for the benefit of all, or do the uecessary amount on each location.

IDLE miners are leaving Butte City, Mout., by hundreds. It is statcd that 3000 men are expected to leave Butte for other mining regions, the greater number going to Utah, Nevada, California and Colorado. What effect the influx of this large uumber of unemployed men will have on labor conditions in these States, where all the men required are already at work, except where strikes prevail, will form an interesting study. Although the greater number of the idle Montana miners are union men, idle men who really want work are inclined to cast their affiliations with labor organizations aside in the search for employment. It may have a direct influence in settling some of the long continued strikes.

AS a reactionary result of the recent strike in the Cripple Creek mining district, Colo., the owners of mines, who are members of the Mine Owners' Association, have determined that all lessees shall employ no miners who are members of the Western Federatiou of Miuers, and if this conditiou, which is inserted iu every lease, is not strictly adhered to, the lease will be declared forfeited. The result of this actiou ou the part of the mine owners is the withdrawal of many men from the Western Federation.

CONCENTRATES.

THE rock specimen from Denver, Colo., contains sulphides of iron, copper, zinc, cadmium and lead; no bismuth present; not tested for precious metals.

✣✣✣✣

THE only gold mining district, and probably the only gold mine in the world profitably producing quicksilver, is the Sacramento mine at Mercur, Utah.

✣✣✣✣

A HEAVY SCREEN of one-half inch mesh placed over the inside copper plate of a battery will prevent scouring. In some mills a perforated cast iron shield is used for this purpose.

✣✣✣✣

EARTH DAMS should be provided with a sheeting of planks on both the inner and outer face, to prevent washing out. Masonry and concrete dams do not require sheeting.

✣✣✣✣

THE Almaden mines of Spain are in the province of Ciudad Real. They are large producers of quicksilver, producing in 1902 about 1245 tons of 2000 pounds or about 32,500 flasks.

✣✣✣✣

SPRINKLING of crude oil on ditch banks and other embankments will keep gophers and other burrowing animals from cutting into the earth, which in some localities is a source of expense from leakage.

✣✣✣✣

STEAM at various pressures has varying temperatures. At 10 pounds pressure the temperature of steam is 192.4°; at 60 pounds it is 295.6°; at 100 pounds it is 332°, and at 180 pounds pressure the temperature is 378.4° F.

✣✣✣✣

THE series of articles on mining methods at Broken Hill, New South Wales, were published in the issues of July 18 and 25 and August 1, 1903. That on the methods at the Homestake, which are similar, appeared in the issue of July 4, 1903.

✣✣✣✣

THERE are copper deposits in St. Genevieve county, Mo., which were discovered in 1863. The ore deposits lie nearly flat and occur in limestone. They have been worked extensively and are equipped with smelters, etc., but they have been idle for some time.

✣✣✣✣

THE Occidental Lode at Virginia City, Nev., is a fissure approximately parallel to the Comstock lode and east of it at a distance of about 7500 feet. It conforms with the sinuous course of the Comstock in a remarkable way, though at so great a distance from it.

✣✣✣✣

PURE uranium is worth about $2 per gram, referring to the pure fused article only. Uranium oxide is worth about $2.50 to $3 per pound, or about $500 per ton (wholesale selling price) for a 10% ore. Uranium ores are valued according to their content of uranium oxide.

✣✣✣✣

TO attempt to run a rope transmission drive with a manila or hemp rope on grooves intended for a wire rope will not do. Grooves for wire ropes are "V" shaped and those for fibre ropes are turned in the form of the letter "U." The rope, whether wire or fibre, must be suited to the size of the groove.

✣✣✣✣

NEARLY all the asbestos which is spun into threads and woven into fabrics is of the variety known as chrysotile, which usually occurs in serpentine. Asbestos, having a harsh "feel," and brittle to the touch, cannot be spun or woven, though for other purposes it may be as valuable as the more silky chrysotile.

✣✣✣✣

THE approximate weight of a conical pile of ore may be determined in the following manner: Square the diameter (in feet) of the base of the pile (presumed to lie on a level base); multiply by 0.7854. Multiply ⅓ of this product by the height of the pile in feet, and (if quartz ore) divide by 20 = tons of ore in the pile.

✣✣✣✣

BY "short circuit" in electrical engineering is meant the metallic or other connection formed accidentally between a positive and a negative wire, by means of which the current may take a short cut, instead of completing its journey through motor, lamp or other contrivance, as originally designed. A "switch" is an arrangement for either closing or breaking an electric current.

✣✣✣✣

A CIRCULAR SAW is a useful adjunct to a mine where timbering is necessary, if power be available to run it. All the scrap timber can be sawed into wedges, which are better and cheaper than band-made wedges. The saw requires to be set on a table made of 6x6-inch timbers carefully framed and solidly bolted together, as the high velocity of the saw when in operation renders this necessary.

✣✣✣✣

IN the Siemens-Halske process, the action of the electric current on a solution of gold is taken advantage of. The electric current decomposes a solution of a metallic salt, the metal being deposited on the negative pole while the metalloid is liberated at the positive pole of the electrolytic cell. In a stated time a uniform current of given strength will deposit a given quantity of metal, and this quantity varies in different metals, just in proportion to their electro-chemical equivalents. This holds good only for strong solutions. Weak solutions like those used in the cyanide process require to be kept in motion, and to accomplish this the solution is passed through the precipitation boxes.

✣✣✣✣

RUSSIA produces about 90% of the platinum mined in the world, a large portion of the remainder coming from Colombia, South America. In 1902 the United States produced only ninety-four ounces, and in 1901 about 1408 ounces. With the production of platinum in 1902, there were also produced twenty ounces of iridium, which greatly resembles platinum in its physical and chemical properties.

✣✣✣✣

THE steam injector takes the place of a pump in forcing water into a boiler. The water and steam mingle at the combining tube, the steam jet is condensed to a water jet. The water jet has a much smaller cross section than the steam jet had, and as the energy of the steam jet is retained a greatly increased velocity results, and the pressure of the water on the delivery pipe causes the water to flow into the boiler.

✣✣✣✣

WHEN gold ore is crushed in a battery, the finest particles produced—the slimes—are usually the richest. After the extraction of the gold by amalgamation, the coarsest grains generally contain the highest values, due to the fact that the grains of sand still contain gold, which can only be freed from its matrix by finer crushing. In considering the advisability of adopting finer crushing, the economic problem must be given consideration.

✣✣✣✣

BY contact metamorphism is meant a change in a rock due to contact with some other rock of later and eruptive origin. Shales are altered to dense hard jasper; slates are indurated, and a development of crystals is a common phase of contact metamorphism. Garnets and chiastolite develop in slates and schists; limestone becomes crystalline marble; sandstone is altered to quartzite and impregnated with feldspar crystals as a result of contact with intrusive rocks.

✣✣✣✣

MALACHITE is green copper carbonate, and azurite is blue copper carbonate. Of these two ores of copper, malachite is the more common. The composition of malachite is carbon dioxide 19.9; cupric oxide, 71.9; water, 8.2 ($2CuO, CO_2, H_2O$). Azurite contains carbon dioxide, 25.6; cupric oxide, 69.2; water, 5.2 ($3CuO, 2CO_2, H_2O$). The difference is mostly in amount of carbon dioxide contained in the two minerals. The cause of the difference of color is not known.

✣✣✣✣

BY "recession of cliffs" is meant the backward movement of the face of cliffs, due to erosion. It was first applied by J. W. Powell to the cliffs of the Grand Canyon of the Colorado river, in Arizona. The wind and rain, heat and frost, each attack the rocks exposed in the face of a cliff and gradually wear it away. Many larger pieces sprawl off and fall to the bottom where they form with smaller fragments and sand a talus. The rate of recession in cliffs depends upon the character of the rocks and upon climatic conditions.

✣✣✣✣

HOT acid waters will decompose and kaolinize feldspars. Large deposits of kaolin and calcium carbonate, resulting from alteration of andesites, may be seen at the hot springs and solfataras about the Lasson peak region of California. Many of the hot springs contain free sulphuric acid, and crystals of sulphur are being deposited around many steam vents. This sulphur is so mixed with earthy materials as to be of little commercial value, as it would have to be refined before shipping to the markets.

✣✣✣✣

PLATINUM and associated metals may be separated from the gravel and sands of placer mines by placing a grizzly in the sluice way, permitting the fine material to pass through onto an inclined table, called an "undercurrent," this table being covered with burlap or canvas. The heavy minerals collect on the table, the greater portion of the lighter passing over into the tailings. To clean up, shut off the water from the sluice and sweep the concentrated material into a launder placed at the foot of the table. When collected, the platinum may be separated from the sands by careful panning or on a concentrating machine.

✣✣✣✣

IN low-lying, flat countries, but little elevated above sea level, the rate of erosion is slow. Large areas of land result from sediment being deposited from rivers, as the country along the lower Mississippi river or near the mouths of the river Nile. Such land is generally being built up by means of freshets, which deposit additional material on land already formed; but when a hilly region has been eroded to a low, flat region, and erosion ceases almost entirely, it is said to have reached a "base level of erosion." Western Australia, although elevated about 1500 feet above the sea, is believed to have been a region of base level of erosion and subsequently elevated. For nearly 1000 miles square the western part of Australia is almost level, there being no mountains anywhere, though low rolling hills are found throughout the region. These hills are supposed to be due to recent erosion.

✣✣✣✣

ON a concentrating table where ores contain several kinds of metallic sulphides these will be found arranged in bands or zones, according to their relative specific gravity, which is approximately as follows: Galena, 7.4 to 7.6; mispickel (arsenical pyrite), 5.9 to 6; pyrite, 4.95 to 5; chalcopyrite (yellow copper sulphides) 4.1; zinc blende (black jack), 4. These several sulphides will be found occupying positions as indicated by their gravity if the table is working properly, but the occurrence of considerable values in gold in any one of them may produce other results. If the blende contains high values in gold when the other sulphides carry only small amounts, the blende will be found at the highest place, with the galena possibly next. Lead carbonate and copper carbonates concentrate with difficulty, owing to their tendency to slime.

✣✣✣✣

A DIAMOND drill hole seldom maintains absolutely the direction in which it is started. If started horizontally it soon takes a slightly upward inclination, and as distance from the machine increases the bit rides higher and higher. This is known as the "drift" of the diamond drill. In drilling through different kinds of material the amount of drift will vary somewhat, and it also varies with the relation of the dip of the strata to the direction of the drill hole. In a hole driven in any direction other than vertical the drill will drift, and even in holes started vertically a slight influence will turn the drill aside, and once having started away from the true vertical line the drift will continue with increasingly greater angle of departure with greater distance from the machine. This tendency of the diamond drill bit to drift is due to the fact that the bit is slightly larger than the connecting pipes, which permits the pipe line to sag slightly, giving the drill hole the direction of an indefinite transition curve.

✣✣✣✣

THE vertical depth at which a tunnel will strike below a given point (vein cropping) on the surface may be determined in the following manner: Measure the slope distance on the surface as accurately as possible from the beginning of the open cut to the point up the hill, at the croppings. By use of a clinometer ascertain the angle of the slope above the horizon, and make a sketch on a piece of paper illustrating the result. The figure will be a right-angled triangle, the right angle being on the tunnel level immediately below the point on the surface. Then as the sine of the angle opposite the given side (in this case sine of 90° = 1) is to the sine of the angle opposite the required side, so is the given side to the required side. Assume the given side (slope distance) to be 1000 feet, and the angle of slope to be 30°. The sine of 30° is 0.5. Then 1:.5::1000: (the required side) = 500 feet. In almost any engineering book will be found a table of natural sines, tangents, co-sines, etc., to a radius 1, by the use of which such problems may be solved.

✣✣✣✣

THE treatment of base ores such as that described by the Downieville, Cal., correspondent is always experimental until the proper course has been ascertained. The permanganate process may work, extracting some of the gold remaining after amalgamation, and also the copper. The chlorination process would also recover a large percentage of gold remaining after amalgamation; the antimony and bismuth would be vaporized in the roasting, and if the silver and lead remaining in the tailings justified the expense, these could be recovered by the hyposulphite process of lixiviation. The lead present is first precipitated by use of sodium carbonate, the precipitate being a merchantable white carbonate of lead. The solution is decanted off and the silver precipitated in the next tank below. The lead could be removed weekly or less frequently as required. The copper could be recovered by passing the solution from the gold precipitation tank over scrap tin or iron. To carry on all of these metallurgical processes would require a plant covering a large area, and it should be arranged to work by gravity.

✣✣✣✣

DRILL STEEL should be tempered dark straw color for hard rock. The drills should be first heated and forged to the proper shape and size and allowed to cool. Later, when the sharpening has been completed, they should be reheated to redness and then quickly plunged and tempered. The temper may also be drawn by first plunging the reheated drill about an inch and withdrawing it and scouring the bit on a sanded board, watching the color slowly descend toward the bit until it has assumed a straw color, due to formation of iron oxide, when it should be plunged several inches and held and stirred about under the water until cool enough to prevent destroying the temper. Picks should be tempered a deep blue. Drills tempered to straw color are very hard and brittle. If the corners check and break off, make the color a little darker, until they will stand. Avoid overheating, both in forging and in reheating to temper. The amount of carbon contained in a steel has a direct influence on its "hardening" properties. A steel containing 1% carbon can be made as hard and as nearly as brittle as glass. The reheating of the steel is probably the most important point. If steel of 1.10% carbon be heated to 700° C. and plunged suddenly into cold water, it is not hardened; but if it be heated much higher, say, 880° or 900° C., then cooled slowly to 700° C. and plunged in cold water, it is hardened. This accounts for the fact that often plunged drills are not properly tempered, having been overheated. Poor steel can not be made good by heating and hardening processes, but good steel can be easily spoiled by improper heating. Iced brine (20% solution) cools and hardens steel more rapidly than pure water, but is not recommended in tempering steel drills.

Dynamos and Motors, Showing the Various Windings and Wire Connections.

Written for the MINING AND SCIENTIFIC PRESS, by WM. H. KRITZER, E. E.

A "dynamo" is a device for converting energy in the form of mechanical power into energy in the form of electric currents by the operatiou of setting conductors to rotate in a magnetic field.

Any dyuamo will run as a motor, aud a current directed currents developed in the armature flow in one and the same direction through the external circuit. In alteruating-current machines the commutator is dispensed with, and collector rings used instead.

Brushes, or collectors of metal or carbon, rest on the commutator to take off the currents from the "segments" generated by the difference of potential iu the armature coils. In a multipolar machine there are as many brushes as there are pole-pieces, if the armature coils are connected in multiple; but if "in series," two brushes may auswer for two or more poles.

from a dynamo seut into a shunt-wound motor drives it in the same direction as that which it would have if it were being driven as a dynamo to produce electricity.

An electric motor is the converse of the dynamo, and is a machine for converting electrical energy into mechanical energy, and the fact of their reversibility was probably as important a discovery as the nineteenth century furnished. The armature is the revolving portion of the dynamo in which the electro motive force is developed which produces the current. It consists of many turns of insulated wire wound around an iron core, which is mounted to revolve in a magnetic field.

The "field magnets" consist of a suitable frame or core, ou which are any number of pairs of pole-pieces containing the field maguet coils.

In direct-current machines a commutator is employed in order to have the successive oppositely

It makes no difference, electrically, whether the field is statiouary and the armature rotates, or the armature is stationary and the field magnets rotate, for only a small amount of current is required to overcome the frictional losses in the machiue itself (which are practically constant), and the amount of curreut taken from the mains is directly proportional to and varies with the external load. If this outside load is increased the current which has been flowing in the armature cannot furnish sufficient "torque" (twistiug or rotary force) for this extra load, so the machine slows dowu; the slowing down decreases the counter electro-motive force which allows more current to flow through the armature, increasing the torque to the proper amount. If the outside load decreases the current furnishes an excess of torque which causes the speed to be accelerated and increases the couuter electromotive force, and this decreases the current until it again furnishes only the required amount of torque.

The most important systems, suitable for mining plants, comprise:

First—Direct current for lighting, power and railway work. This system is adapted for short distances, and has a low voltage and high amperage, and can be connected according to either the two-wire or three-wire system. Generators are now built, which with the last named system of wiring, supply direct current at two voltages, which does away with having two machines always in operation, or some other form of balanciug apparatus.

Second—Alternating current for lighting and power, aud direct current for railways. The alternating current is adapted to long distances, and has a high voltage and low amperage, and with the motors beiug manufactured of the iuduction type that have neither brushes, commutator, collector rings uor other moving contacts, makes it preferable, especially if the motors are exposed to dust and dirt, for they have the advantage of being entirely sparkless, with an absolute safety of danger from explosion or fire. In this system if a direct-current dynamo is not wanted for the railway or haulage system, and the amount of current required is small, a rotary converter can be used in connection with alternatiug-current generators, or it may be advautageous to install a double-current generator, furnishing both direct aud alteruatiug curreut.

Third—Alternating current of high voltage for power distribution to sub-stations, where it is trans-

formed into either a direct current or to a low voltage alternating current, or both. This system is preferable for localities where a large number of

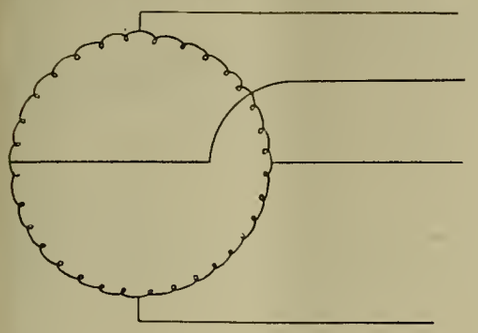

FIG. 13.

FIG. 22.

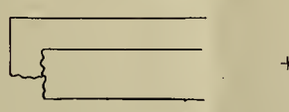

FIG. 23.

mines can be operated from one central power station, as the high-voltage alternating currents may be transmitted to the various mines, and there transformed into a direct or alternating current of suitable voltage for safely lighting the plant or operating the machinery.

Fig. 1 illustrates an alternating current dynamo or motor, having collector rings in place of a commutator, brushes and other attachments.

Fig. 2 shows a direct current dynamo or motor, showing commutator, brushes and other attachments.

Fig. 3 is a direct current dynamo or motor, series wound. It has but one circuit, and all the current generated in the armature is sent through the field magnet coils, which are connected in series with the armature, thence to the line and back to the armature. It is used in places where heavy starting torque is required and frequent and wide variations of speed are desirable, such as hoisting and haulage motors, arc lighting, etc. This type is of no value where the voltage is desired to remain nearly constant.

Fig. 4 represents a direct current dynamo, shunt wound. It has a small portion of the whole current generated by the armature directed through the field magnets, which are wound with many turns of fine wire. These coils are connected to the brushes of the machine and constitute a shunt, by-pass, or a derived circuit, the remainder of the current passing through the line by a different path. Used for central stations, railway generators and where a constant speed is desired.

Fig. 5 illustrates a direct current dynamo or motor, compound wound. This has both series and shunt windings. The field magnets are wound with two sizes of wire, the coarse wire being connected in the main circuit and the fine wire in the shunt circuit, across the terminals of the dynamo. Used where a self-regulating machine is desired, as the series winding keeps up the field strength while the load is being increased in sufficient measure to make up for certain losses, and keeps the voltage at the machine terminals constant.

Fig. 6 shows a direct current dynamo or motor, shunt and series wound. A long shunt is one connected across the machine terminals, while a short shunt is connected directly across the armature. There is no measurable difference in performance between these two connections, but the latter may give a slightly higher effect to the shunt winding.

Fig. 7 is a direct current dynamo or motor, separately excited. Having the machine separately excited saves the reactions due to the armature current, keeping its magnetism in the field, and the electromotive force independent of changes of resistance going on in the working or main circuit.

Fig. 8 illustrates a direct current dynamo or motor, series and separately excited.

Fig. 9 represents a direct current dynamo or motor, series and magneto excited.

Figure 10 shows a direct-current dynamo or motor, shunt wound and separately excited.

Fig. 11 is that of a direct-current Edison three-wire system, not much employed except for large installations for central supply.

Fig. 12 shows an alternating current dynamo or motor, single phase, separately excited in field circuit. These have the advantage that, with the same weight of materials, an output can be secured from it nearly twice that of the direct current type, and the ability to transform its potential into any desirable voltage by means of transformers. Then the simplicity and durability of the collector rings in place of the commutator adds much to its value.

Fig. 13 is an alternating current dynamo or motor, two phase, ring connection. Fig. 14: Alternating current dynamo or motor, two phase, star connection. Fig. 15: Alternating current dynamo or motor, tri-phase, star connection. Fig. 16: Alternating current dynamo or motor, tri-phase, triangular connection. Fig. 17: Single phase 2-wire. Fig. 18: Single phase 3-wire. Fig. 19: Two phase 3-wire. Fig. 20: Two phase 4-wire. Fig. 21: Three phase 3-wire. Fig. 22: Three phase 4-wire. Fig. 23: Monocyclic or direct-current 2-wire.

Ordinary, simple, alternating current is called a single-phase current, but by taking current from connections at different points around the armature of an alternator, it is possible to obtain a number of currents differing from one another in phase. We thus get what we call single-phase, two phase, three phase, and monocyclic, the latter being a combination of a single-phase and polyphase arrangement. It matters not whether the coils are interlinked, or separately grouped, ring or star connected, the principles of action are similar, and the characteristic polyphase results are equally present. The supply of power is continuous and uniform and is used to operate the induction motors. The principal objection to this system of power transmission is the increased number of main circuit conductors which are required.

Figs. 17–23 show the standard systems of alternating-current distribution and the various combinations of conductors in general use.

It will be seen that the direct current system requires only 50% of the copper in the single-phase system when used in long distance transmission of power. The conductivity of aluminum is about 60% that of copper, so that for continuous current circuits the proper size of wire may be easily ascertained. In alternating current circuits, however, its substitution for copper is by no means so simple an operation.

(TO BE CONTINUED.)

Consumption of Zinc in Cyanide Plants.*

NUMBER II.

Written by WALTER H. VIRGOE.

On the sands plant 151.9 kilos of metallics were obtained and 458.5 kilos from the slimes plant. The reduction of these metallics produced 7.876 kilos of gold and silver, and from the comparative values of the two classes of metallics it may be assumed that 4.284 kilos of this amount were produced from the sands plant and 3.592 kilos from the slimes plant.

The analysis of these metallics is not known, except in so far as their gold and silver contents go; but it can be assumed, for the sake of argument, that the balance of the material is metallic zinc; consequently, we perceive that 151.9 kilos of metallics were removed from the sands plant boxes containing 4.28 kilos of gold and silver; hence, the removal of these metallics involved a mechanical waste of 147.6 kilos of zinc. An analysis of the sands plant "fines" showed that this material contained 25% of zinc, and, therefore, since 191.3 kilos of fines were removed, this removal involved a further loss of 47.8 kilos of zinc. Hence, the total mechanical loss of zinc on the sands plant for the period mentioned appears to be approximately 195.4 kilos of zinc. The chemical loss is that represented by the difference between the total consumption, or, in other words, by the amount of zinc added to the boxes during the period covered, viz., 1397.3 kilos, and the mechanical loss of 195.4 kilos, which is about 1201.9 kilos.

Table "B" shows these results in tabulated form.

Considering the consumption of zinc on the slimes plant, 458.5 kilos of metallics were obtained, representing 3.592 kilos of fine gold and silver bullion; therefore, it may be assumed that the removal of the metallics involved a mechanical loss of 454.9 kilos of zinc. Again, 260.4 kilos of fines were removed from the boxes, an analysis of a general sample of which showed the presence of 15.8% of zinc; hence, this removal of fines entails a mechanical loss of 41.1 kilos of zinc.

The total mechanical loss on the slimes plant is about 496 kilos of zinc and the chemical loss is about 288.7 kilos. The results may be thus tabulated:

	Sands Plant.	Slimes Plant.
Chemical loss	1,202.00 kilos	288.7 kilos
Mechanical loss	195.4 "	496.0 "
LOSSES PER TON OF ORE TREATED.		
Chemical loss	0.45 kilo	0.19 kilo
Mechanical loss	0.07 "	0.33 "
LOSSES PER TON OF SOLUTION FLOWING THROUGH THE BOXES.		
Chemical loss	0.254 kilo	0.032 kilo
Mechanical loss	0.0413 "	0.055 "

From these data it will be observed that there are causes at work on the sands plant tending to produce a high chemical consumption of zinc, and causes at work on the slimes plant that tend to produce a low chemical consumption, but a high mechanical consumption of zinc.

The respective conditions on the two plants are as follows:

The sands plant extractors consist of four boxes with eight compartments.

The zinc capacity of the four boxes is 40.64 cubic feet.

One cubic foot of zinc pressed into the boxes weighs 13.5 pounds, the shavings being cut from No. 9 zinc by hand labor; consequently the zinc capacity is 40.64 cubic feet = 584.64 pounds.

Each ton of solution per hour has allotted to it 25.4 cubic feet of zinc.

The slimes plant extractors consist of four boxes with five compartments.

The zinc capacity of the four boxes is 60 cubic feet = 810 pounds.

Each ton of solution per hour has allotted to it 20.0 cubic feet of zinc.

The precipitation is practically perfect on both plants, and strength of solution flowing through the sands boxes averages about .32% KCy, while the strength on the slimes plant is about .04% KCy. The statistics with reference to the zinc boxes would indicate that those on the sands plant are of somewhat larger capacity than necessary; 20 cubic feet should be ample per ton per hour.

During the four months 2646.4 tons of sands were treated and 1481 tons of slimes, both classes of material being practically the same value in gold and silver per ton, and the extractions obtained on both plants were about equal. Therefore, the principal differences lie in these features: On the sands plant comparatively small amounts of strong solutions flow through the zinc, and on the slimes plant comparatively large amounts of very weak solution flow through a relatively large amount of zinc, and containing and depositing a little more than half the values deposited by the sands plant solutions.

It appears that strong solutions depositing considerable product tend to cause a heavy chemical consumption of zinc, and weak solutions depositing a comparatively small amount of product cause a heavy mechanical loss and a light chemical one.

At one period lead acetate was used to coat the zinc shavings in the slimes boxes, and it was thought that some of the consumption might be attributed to

*Jour. Chem. Met. and Min. Soc., S. A. (Condensed.)

this cause, but a discontinuance of the use was not attendant with any apparent lowering of the consumption, either chemical or mechanical.

No doubt the heavy mechanical consumption is to some extent due to the use of hand-cut zinc. Upon a neighboring plant, treating the same class of ore from the same vein, and having a capacity of about 9500 tons per month, the consumption is reported as being .34 kilo, or .74 pound per ton of material cyanided, the zinc used being cut by mechanically fed lathes from sheet zinc.

As both plants are under excellent management, there is no doubt but that the consumption of zinc, although it appears high in comparison with Rand records, is normal under the conditions of plant treatment necessary for the ore in question. Upon the Rand there is some variation in the different plants, but the average consumption may generally be taken to be about .3 pound per ton.

One feature will be observed: A cubic foot of zinc, according to Mexican practice, weighs about twelve to thirteen pounds. The weight of a cubic foot of cut zinc, as used on the Rand, weighs about seven pounds; the reason for this is that coarse zinc can be compressed more compactly into the boxes on account of the greater strength of the thicker threads. The thickness of the thread must be determiued by the character of the plant; but where much metallics are produced a fine thread is to be advocated; where very few metallics are produced and the chemical consumption is somewhat high, coarsely cut zinc should be used. The character of the thread used must be determined by the judgment and experience of the operator; there is no fixed rule.

When the effect of this mechanical and chemical consumption of zinc is cousidered, the cost involved in the reduction of metallics and the effect upon the plant solution of the presence of zinc is an important item.

The nature and causes of the consumption of zinc, as evidenced by practical plant operations, are not to be lost sight of; there is no doubt as to the value of records of consumption kept in this way; to the observant operator they convey a great deal of information, tending to assist in the elucidatiou of problems that present themselves in practical work. The chemistry involved in the solutiou of zinc has not been discussed, because so much has beeu writteu upon that point, and accepted formulæ seem perfectly clear and satisfactory.

In considering the effect of the loss of zinc, undoubtedly heavy mechanical losses involve the cost of the refining of the metallics. Plants running with light mechanical zinc losses have invariably lower costs in the reduction of their bullion. The costs involved in the treatment of product ou the plant alluded to for the period of four months, to which the zinc consumption records refer, may be briefly considered.

610.49 kilos of metallics were produced ou the slimes and sands plants. The reduction of these metallics cost, exclusive of labor, fuel and crucibles, as follows:

943	kilos of acid @ 13c per kilo		$122 59
7.41	"	soda (carb.) @ 55c per kilo	4 07
7.41	"	sand	
19.77	"	borax glass @ $1 36	26 88
			$153 54

The weight of pure bullion produced was 7.876 kilos = 253.29 troy ounces; hence, the cost per ounce of pure bullion is 60 cents (Mexican). Exclusive of acid, the treatment costs would be about 12 cents.

The acid-treated material represeuted 10%—11% of the weight of the raw metallics—and had a fineness of 12% to 13%.

The bars produced ranged in fineness from 931 to 962 parts in 1000.

The cost of the reduction of the fines was as follows:

SANDS PLANT.—191.3 kilos of fines were produced (material passing a 40-mesh), cost of reduction being as follows:

20.64	kilos of soda (carb.) at 55c per kilo		$11 35
55.01	"	borax (glass) @ $1 36 per kilo	74 81
20.64	"	sand	
			$86 16

The weight of fine bullion produced was 81.456 kilos = 2618.86 troy ounces; hence the cost per ounce of pure bullion is $3.28 (Mexican), exclusive of labor, fuel and crucibles.

The sands plant fines were 42% fine before reduction, and the fineness of the bars produced rauged from 932 to 950 parts in 1000.

SLIMES PLANT.—260.4 kilos of fines were produced, cost of reductiou being as follows:

28.00	kilos of soda (carb.) @ 55c per kilo		$15 40
90.07	"	borax (glass) @ $1 36 per kilo	122 50
28.00	"	sand	
			$137 90

The weight of fine bullion produced was 37.446 kilos = 1203.91 troy ounces; hence the cost per ounce of pure bullion is $11.4 (Mexicau), exclusive of labor, fuel and crucibles.

The slimes plant fines were 14% fine before reduction, and the fineness of the bars produced ranged from 913 to 965 parts in 1000.

The fines from the sands plant are 42% fine as they come from the boxes, whereas the fines from the slimes plant, which has a high consumption of zinc, are only 14% fine, a little finer thau the acid-treated metallics of the two plants, and the cost of reducing these latter fines is about the same as the cost of reducing the acid-treated material.

The preceding figures serve to show how mechanical ziuc losses affect the cost of the reductiou of the product.

Milling on Douglas Island, Alaska.*

NUMBER III—CONCLUDED.

Written by R. A. KINZIE.

Cleauup in the various mills is conducted in the same fashion and so regulated that all will be finished by the 15th of each month.

The first day of the cleanup is devoted to the amalgam traps and the tank in the amalgamating room.

To clean a trap, five stamps are hung up and the feed water shut off. When the pulp has ceased to flow through the trap, the wedge that holds the wooden center piece is loosened and the center piece removed, first being washed to cleanse it of any adhering amalgam. Theu the tap in the lower end is opened and the couteuts of the trap allowed to flow out into a smaller launder, which conveys the material to a central tank. The trap is then carefully washed out, the tap and center piece replaced, and it is ready for use. It takes an average of five minutes to clean each trap. When all the traps have been cleaned, the contents of the receiving tanks, after being roughly washed, are collected and taken to the amalgamatiug barrel for further treatment. In the meantime the conteuts of the tank in the amalgamating room have beeu removed. This is added to the product from the mercury traps, and the total charged into the amalgamating barrel.

This barrel is made of cast iron, 20 inches in diameter and 4 feet long. It is supported in a horizontal position by irou trunnions cast in the head, and is driven at the rate of fifteen revolutions per minute by a belt leading to one of the vanner countershafts.

The barrel is charged through a handhole in the top, which cau be hermetically sealed; from 300 to 500 pounds of ore constituting a charge. From 75 to 125 ounces of mercury is then added, six iron cannon balls put iu to act as grinders, and the barrel filled with water. The handhole cover is then put on, and the barrel started revolving. The charge is left in the rotating barrel twelve hours; the barrel is then opened, and the charge allowed to run out into the amalgamating pan. This pan is made of cast irou, 4 feet in diameter. Around the edge, with the exception of a space 8 inches wide to serve as an outlet, is a rim 2.5 inches high. The bottom is made slightly concave to resemble a Mexican batea. The concentratiug motion of a batea is imitated as closely as possible. This is obtained by means of au eccentric, belt-driven from oue of the counter shafts of the mill. When the barrel is stopped, the canuon balls are taken out and put in the pan, which is immediately started. By the motion of the pan the heavy contents are concentrated in the middle while the lighter are washed off by means of a stream of water flowing through it, the concentrated product being kept in motion, and at the same time, ground by means of the cannon balls.

When the concentrate is cleaned of all light material, the pan is stopped and the pieces of iron, etc., removed. The amalgam is then put in a pan, the finer particles of irou removed by means of a magnet, and the other foreign material by a sponge or other means. Wheu the amalgam is clean, it is put in small cloth bags aud the quicksilver pressed out by means of a hydraulic ram, designed by one of the mill foremen. The pressed cakes of amalgam are weighed and sent to the assay office to be retorted aud melted into bullion.

The second and succeeding days are devoted to the cleaning of the batteries and amalgamating plates. These are cleaned at the rate of four batteries of five stamps per day. (In the Treadwell 300-stamp mill five batteries are cleaned per day.)

To clean up a battery the feed is shut off and the stamps allowed to drop until they begin to pound on iron, then they are hung up. The water is theu shut off, and the splash boards, curtains, screens and chuck blocks are removed. The water remaining in the mortar is dipped out, and the coarse sand around the top of the dies shoveled into buckets to be put back into the mortar when the cleanup is over. The lip of the mortar and the plates are then carefully hosed off (a trough beiug first put in the tail box to catch any loose amalgam) and the entire surface of the plate covered by a wooden cover for steamiug. A space of ¾ inch is left betweeu the cover and the plate by means of three slats ¾-inch thick nailed to the bottom of the cover. Sacks or other coverings are placed over the ends aud edges to prevent the escape of steam; the end of a steam hose is then introduced through a hole in the cover, the steam turued on and allowed to remain so from twenty to thirty minutes. Iu the meantime a second battery is prepared, and any renewals made ready, so that no time will be lost when the mortar is cleaned out. While the plate is being steamed the chuck block is cleaned of any adhering amalgam, recoated with quicksilver, and is ready to be replaced; while the sand-distributing box on the vanners, corresponding to the batteries shut down, are taken off and the amalgam removed from the copper plate by means of chisels. This amalgam is collected, the plates dressed in the usual manner, the distributing box replaced, and the vanner is ready for starting. Wheu the plate has beeu sufficiently steamed, the steam is shut off and the cover removed and taken to the next plate that has already been prepared for its reception. The steamed plate is then allowed to cool for a few seconds, when the operation of removing the amalgam commences. This is done by scraping the plates with sharp chisels, and as much amalgam as possible is removed without exposing the copper. The amalgam is then collected, taken to the amalgamating room aud locked up for further treatment.

Two men now begin work on the mortar, and to protect the plates a wooden platform is placed at the head for the men to staud on. If there are no renewals necessary (but this is unusual) only a portion of the sand is taken out. If necessary, the shoes are removed by driving a wedge through the eye left in the boss head just above the end of the shank of the shoe and forcing it out. The saud is then dug out of the mortar by means of sharp-pointed hand picks and scoops, the die and liners removed, and the mortar thoroughly cleaned. All pieces of iron, together with the worn-out shoes and dies and liners, are taken to the amalgamating room to be thoroughly cleaned, aud the heavy sand taken to the cleanup barrel.

The liners and false bottoms are then put in and the die set on the false bottom, while the fine sand first removed from the mortar is tamped around the die to hold it in place. The shoe is theu set on the top of the die with a collar of wooden shims around its neck. A 3¼-inch block is then placed on the top of the neck of the shoe, and the stamp lowered until the boss head rests on the block. The keys of the tappets are loosened and the tappet is allowed to fall down to the finger, where the keys are tightened. If the shoe has not been removed, a 9¼-inch block is placed on top of the die and the tappets set as above. Each shoe is then successively dropped and hung up, when the shoe is firmly fixed in the boss head. The recesses for the chuck block, screens,

*Abstract Trans. Amer. Inst. Min. Engrs.

etc., are washed out, and the chuck block, screens and dash boards put in place. The plate is then washed with a weak solution of cyanide, when quicksilver is sprinkled over its surface and thoroughly rubbed in with whisk brooms. The quicksilver is evenly distributed by rubbing with cloths moistened with a weak solution of cyanide. Some ore is now fed into the mortar, working the feeder by hand, the water turned on, the small cleanup trough removed from the tail box and the stamps allowed to drop. Particular care is paid to the feeding of ore when the stamps are started, as the mortar is empty of all ground material.

The heavy sands from the mortar are treated in the cleanup barrel in the manner described above, while the amalgam removed from the plates and chuck blocks is simply ground in the cleanup pan and the amalgam cleaned in the usual manner.

A System of Continuous Concentration of Ores by Oil.

Written for the MINING AND SCIENTIFIC PRESS by J. W. VAN METER.

The adoption of oil concentration at the Hacienda of La Victoria by the Sociedad Minero Alpimina of Lima, Peru, for the concentration of the ores from the famous Carahuacra silver mine, starts the operation of their large reduction works at Yauli, and opens again one of the greatest silver-producing mines of South America, after more than $1,500,000 had been spent on the property by a Peruvian capitalist, Carlos Gildemeister.

The encountering of large quantities of zinc in the ore interfered to such an extent with the lixiviation treatment that the property had to be closed down in 1893 and has remained idle since, until recently, there being no successful method of treatment discovered. During the last nine months, repeated concentration tests of the Carahuacra ores have been made at the Santa Barbara oil concentration plant at Yauli, which have proven highly successful, and it has been practically demonstrated that the rebellious element of the ores could be successfully separated by oil concentration.

The separation of the concentrates, whereby two different products are obtained, is based on the principle that a highly charged aluminated hydro-carbon oil, under different temperatures, has the exceptional properties of selecting and retaining certain minerals from a pulp to the exclusion of others.

The concentration plant of La Victoria will consist of two 100-ton unit Van Meter - Boss concentrators (continuous system) arranged in tandem, the tailings of the first discharging into that of the second. From the first concentrator will be obtained the rich silver concentrates, from which the zinc has been separated, and from the second a zinc concentrate low in silver. The silver concentrates will be treated by the present lixiviation plant, while the zinc concentrates will be treated separately for a zinc product.

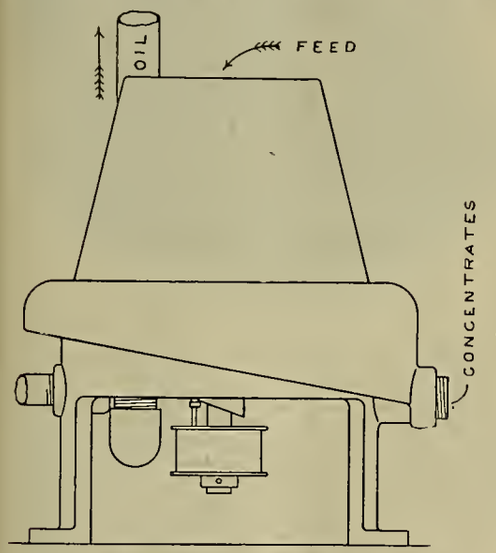
Having erected and operated the first oil concentrating plant in America, which proved financially successful in the concentration of the silver and copper ores of Peru, and the subsequent adoption of this system for the concentration of tin ores in Bolivia, a few ideas relative to the selection of the oils and mechanical conveniences necessary to obtain the best results may be of interest to those contemplating oil concentration.

The selection of the oil is the most important feature of all, and requires the skill of a chemist, who should be an expert on oils. The selective action of a petroleum residuum oil for mineral particles of pulp is well known; but to obtain an oil whose selective properties are such as to select one mineral from the pulp while leaving another, requires much skill, and can only be accomplished by one experienced and thoroughly acquainted with the metallic combination of ores and the chemical combinations of oils.

An oil may be compounded whose selective action proves perfect in the laboratory, and at the same time would not be a commercial success in the working plant, owing to lack of practical experience and knowledge on part of the operator.

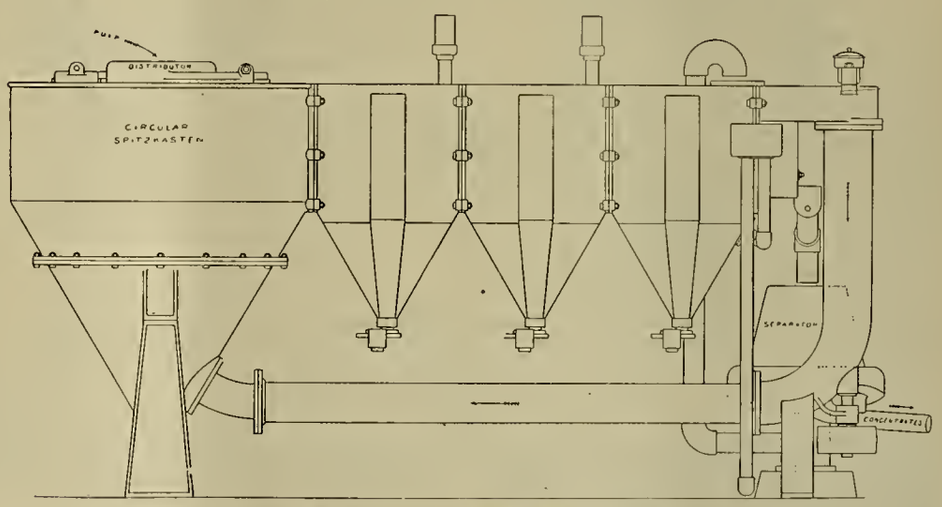
The oil which I have employed in concentrating operations for the past eighteen months, treating the silver-tin ores of Bolivia and the silver-copper ores of Yauli, Peru, has proven highly successful. It is specially treated, aluminated hydro-carbon oil, the manufacture of the same necessitating a considerable outlay for special machinery at Lima. The acidulated, aluminated salts and products are difficult to handle successfully in commercial quantities, the manufacturing of same involving great care and an expensive manufacturing plant.

The writer has the best success with the Pennsylvania oils, and also the oils from Piura, Department of Tumbas, Peru. These oils all have a paraffine base. Laboratory experiments with certain California oils were perfect, but gave indifferent success in the working plant. The most satisfactory oil heretofore produced is compounded by the W. P. Fuller Co. of San Francisco, owing to their having special machinery for its manufacture. Many unsatisfactory results in oil concentration have followed where the experimenters have labored under the impression that it was essential for the pulp to pass through the body of oil, and that by so doing better results would be secured.



The selective action of oil for the metallic particles of the pulp depends upon the surface contact of the pulp and oil, selective action rarely taking place when the pulp is within the body of oil, the commingling, of mixing or agitating of the same to obtain the surface contact being useless and detrimental to the process.

Upon examination of a body of mineral-charged oil, the mineral particles are found adhering only to the surface, leaving the interior free from mineral. Therefore, in a body of oil the more surface exposed to a mineral pulp the greater the extraction of the mineral by the oil. This has been clearly demonstrated by a series of experiments, conducted with two hollow cylinders about 12 inches in diameter, but of different height, arranged in a vertical position, the first cylinder being about 20 feet in height and stationary, the second being about 2 feet in height and arranged to rotate at a speed of about 200 revolutions per minute, and provided with a brake, by the application of which it can be brought to an abrupt stop, allowing the contents to rotate within. The two cylinders being filled with oil, a quart of mineral pulp was poured into the larger so as to pass through the center of the body of oil. Upon examination of the pulp afterwards, it was found to have lost 2% of metallic mineral and 7½% of gangue. The same experiment was conducted with the second cylinder while its contents were in rotation and upon examination the pulp was found to have lost all the mineral and none of the gangue, the centrifugal action of the oil discharging the gangue and at the same time bringing the surface of the oil in contact with the pulp.



Upon this experiment the fundamental principle of the Van Meter-Boss continuous system of oil concentration is based.

The centrifugal action of the body of rotating oil in the spitzkasten produces the contact between the oil and pulp, at the same time passing the mineral-charged surface at the rate of 900 square feet per minute, from the body of oil, allowing a new surface to be presented at the same rate. As only the mineral surface so discharged passes through the separator (the main body of oil being used as a circulating medium within the concentrator), it greatly increases the capacity of the separator and dispenses with the bulky spitzkasten, vats, etc. It will be seen by this method that the commingling, mixing or agitation of the oil and pulp is entirely eliminated, which has been the cause of failures in oil concentrating devices. The separation of the concentrates from the oil has been brought to a high state of perfection. Instead of using the cumbersome hydro extractors, or centrifugal drums, which have to be stopped at intervals for the removal of the concentrates, only to pass through a similar process of cleaning, a small centrifugal separator has been adopted, which carries out the whole process of separation and cleaning, the concentrates being discharged continuously, free from oil without stoppage of the separators. One of the above separators, with 26-inch cone (weight 1200 pounds), running at a speed of 1000 revolutions per minute, has a capacity of separating sixteen tons of mineral-charged oil in twenty-four hours.

During the month of June, 1902, at the Santa Barbara oil concentration plant, Yauli, Peru, the following run was made for the purpose of ascertaining the selective action of aluminated hydro-carbon oil, under different temperatures. Two concentrators were arranged so that the tailings from the first discharged into the second. The oil in the first was kept at a temperature of 140° F., and in the second at 60° F. Two hundred and eighty-five tons of silver-copper ore was selected from the mines of Julio, Celia, and Santa Teresa, the average assay value being about $35 per ton.

Centrifugal Cone Separator, Continuous Discharge.

100-Ton Standard Unit Van Meter-Boss Oil Concentrator.

STATEMENT.

Mine.	Number tons	Temperature of Oil. Concentrator No. 1	Temperature of Oil. Concentrator No. 2	Amount in Pounds Concentrates. Concentrator No. 1	Amount in Pounds Concentrates. Concentrator No. 2	Assay Value Concentrates per Ton. Concentrator No. 1	Assay Value Concentrates per Ton. Concentrator No. 2	Assay value per ton tailings	Number gallons oil	Remarks.
Celia	165	140	60	4,250	14,020	$1,112 00	$346 00	$1 22	110	Cost of labor.....$71 00
Julio	80	140	60	1,500	3,500	1,540 00	215 00	1 60	58	Cost of oil per gallon.....8c
Santa Teresa	40	140	60	425	1,600	905 00	245 00	1 45	29	

From the foregoing it will be seen that oil does not only act as a concentrator, but under different temperatures will act as a separator. The quick success of concentrating by oil in South America is largely due to the enterprise and liberality of Dr. Octavio Valentine, a wealthy mine owner of Peru, on whose property, at Yauli, the first successful oil concentration plant in America was erected.

The value of oil concentration is rapidly coming to be recognized, and I know of no other field in the metallurgical line more promising for research than the concentration and separation of minerals by means of oil.

Alluvial Deposits of Horsefly, B. C.

NUMBER II—CONCLUDED.

Written for the MINING AND SCIENTIFIC PRESS by W. M. BREWER.

At the time of the writer's visit to this property active operations had been suspended aud during the past season a sample mill run only had beeu made. It would appear that the owners of the property would be justified in prosecuting development in order to determine whether the extent of the deposit of cemeut in this ancient channel is sufficiently large to warrant the erection of a stamp mill of much greater capacity thau the present one; because it does uot seem as though a 10-stamp mill, being operated on material of such low average grade as this is shown to be, could result in commercial success, even though the duty of each stamp was to crush 5½ tons of this cement per day, which, according to the manager's reports, has been about the average.

In accordance with this view, the writer finds that in the last report of Manager Hobsou to the shareholders he recommeuds the expenditure of $200,000 as the total cost of the necessary development work and installation of an 80-stamp mill, which he estimates will place the mine on a dividend-paying basis.

The cost for miuing aud milling he estimates at $1.12 per ton, and the lowest average tests which had been obtained at any time from drifting and milling were $1.12 per tou, and seven tests of selected gravels, the first four of which were made in 1897 and the others in 1898, are reported to have resulted as follows:

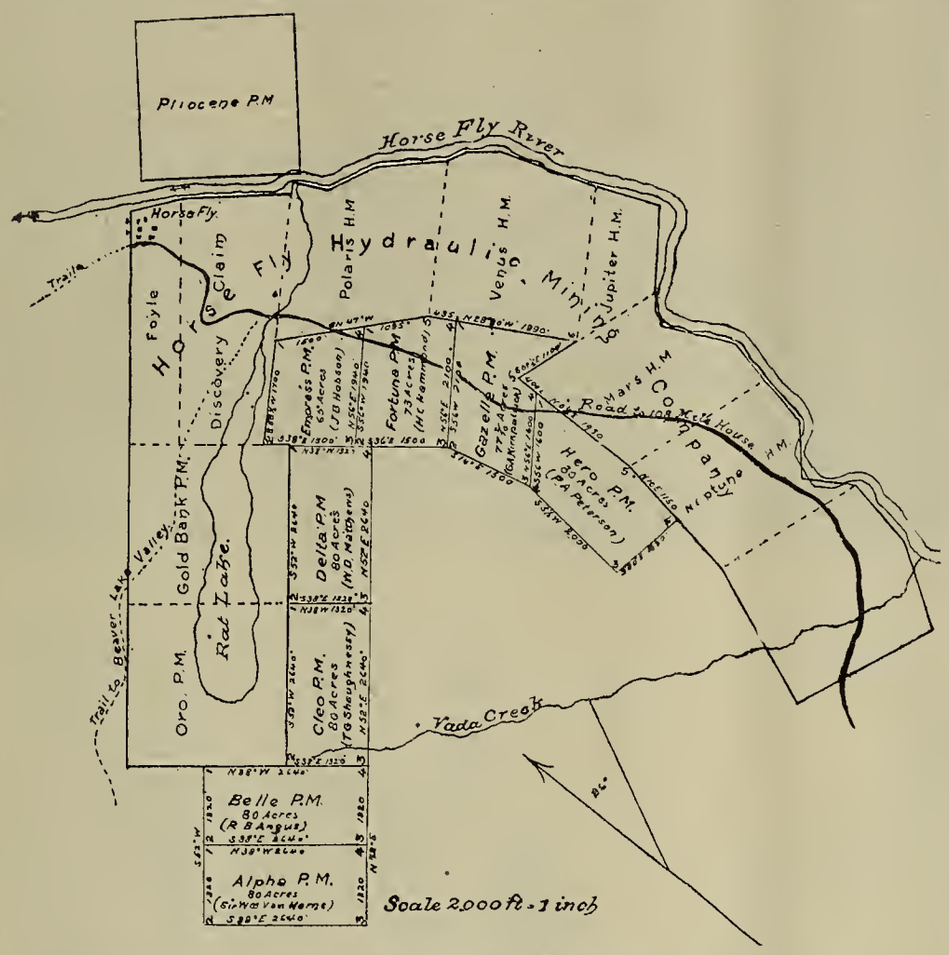
		Quantity Milled.	Product Per Ton.
1897	No. 1	100 tons	$3 42
"	No. 2	100 "	4 13
"	No. 3	100 "	2 18
"	No. 4	100 "	4 13
1898	No. 5	50 "	5 02
"	No. 6	100 "	3 07
"	No. 7	100 "	4 31

Some idea of the gravel deposited in this aucieut chanuel cau be formed when the extent already exploited is considered. Iu addition to the area which has been washed over by the hydraulic process, where the bedrock is exposed over an area of four or five acres, the main tunnel, which is really run to crosscut the channel, has been driveu 1200 feet from the northerly rim and has apparently uot yet reached the center of the channel; therefore, the positiou of the opposite rimrock, as well as the distance from rimrock to rimrock, is as yet undetermiued, as is also the length of the chanuel.

The thickness of the high-grade cement varies from 2 to 6 feet, while the thickness of the eutire deposit from the present surface to bedrock averages about 150 feet; this is made up of about 20 feet of boulder clay from the surface down, the remainder being free and cemented gravel, of which the highest grade is the stratum already referred to, which immediately overlays the bedrock.

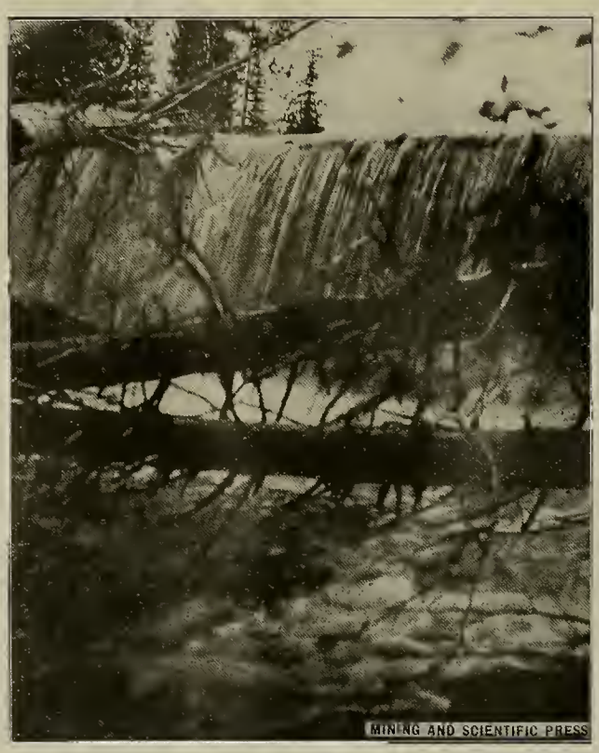
On the Ward claim, 5 miles farther up the river, all the work which has been done has been by hydraulic process and elevating the tailings. The material washed is piped from the face of the bank to the foot of the elevator, which is of the suction pattern, elevated 50 feet, discharged onto a grizzly aud dumped into sluice boxes, the discharge eud of which reaches to the tailings dump.

Mr. Ward, the manager, informed the writer that about 80% of the values contained in the gravel were saved before the material was elevated; but of this amount it appeared to the writer that a considerable proportion was lost between the face of the cut aud the bottom of the elevator, because the material is washed over the gravel floor of the cut, instead of beiug piped into a flume furnished with riffles.



The material in that portion of the channel on which Ward's claim is located, although showiug that some cemeuting process had been at work, has uot become as compact and hard as at the Horsefly mine; consequently, drift mining has not been resorted to, the material still being sufficiently free for piping.

The writer during his visit witnessed a somewhat unusual condition which characterized a stratum of boulder clay, almost black in color, which Mr. Ward had previously considered as beiug barreu of values. From motives of curiosity, more thau the hope of finding values in this material, he panned some, with the result that it yielded nearly 50 cents to the pan; he then started to prospect the material with sluice boxes, and as a result of two days' work by five men, shoveling into sluice boxes, cleaued up $90, and demoustrated that the pay stratum averaged between 3 aud 4 feet in thickuess.



The depth from the present surface to bedrock varies in this portion of the chauuel, the maximum being 150 feet; but, owing to the liftiug capacity of the elevator, 60 feet is the greatest depth to which work can be carried.

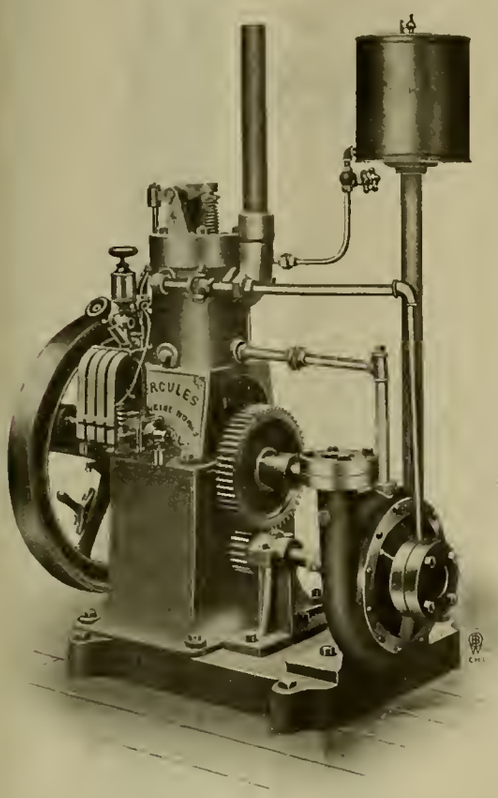
This property has beeu worked siuce 1876, and, when couditions are favorable, often yields as high as $1000 per day, the quautity of water used being about 2000 miner's inches. This supply is furnished from Mussel creek, being taken out just above the falls, aud about 2 miles uearer the mouth than the location of the dam coustructed by the Horsefly Hydraulic M. Co.

On Mussel creek, which is a tributary of the Horsefly river, the rock formation changes from shale to basalt, and it is near the falls that the stratum of white quartz gravel underlies the basalt. On the same creek, and about 4 miles above its mouth, the eruptive rocks contain impreguations of native copper. Particles from the size of the head of a pin to a coffee bean are fouud disseminated through the basalt with greater or less regularity, probably averaging 1% or 2%. The extent of the mineralized zoue has never beeu determined, principally for the reason that lack of transportatiou prohibits the attempt to work any but placer, hydraulic or free-milliug gold-bearing rock in this portion of the Province.

Map of Horsefly Co.'s Property, British Columbia.

Dam on Mussel Creek, British Columbia.

A Number Scheme for Mines.



TO THE EDITOR:—I have read with interest the suggestion of Mr. Alderson, appeariug in your issue of October 24, eutitled "A Number Scheme for Mines." It is a good idea and one capable of application iu many large mines where no system of numbering is in use, but where it could be introduced to advantage. I would suggest, however, that mill holes, each 20 feet, are unnecessarily close—30 feet being the usual distance of chutes from ceuter to center. This leaves a distance for the shovelers of only 12½ feet on either side of the center of that block of the stope. It also seems au unnecessary expeuse to put up raises every 20 or eveu every 30 feet. Ordinarily a raise at each end of a shoot of ore of moderate length is sufficient, and in very long shoots every 100 feet is a sufficiently short interval. If the mine is being operated by the block system, then a raise at either end of each block will be necessary, or a double compartment raise at the center. By placing the first chute 30 feet from the shaft on the 100 level it would be proper, according to Mr. Aldersou's scheme, to number it 103, aud thereafter the numbers would run 106, 109, 112, etc. This admits of the numbers running up to 199, which would indicate a point 990 feet from the shaft. It is seldom that drifts are driven a greater distance from a shaft without making connections with workings from a second shaft. The raises should be designated as such and may be given each its appropriate number, as, for instance, the first raise and the first chute may be put up together—in double compartmeut, and called "raise 103," and the next at 120 feet (also double compartment), called "raise 112" which indicates that this raise is on the 100-foot level at a point 120 feet from the shaft, with 90 feet between No. 103 and No. 112.

In working both ways from the shaft the system could be carried out by calling one side arbitrarily north or south, east or west, as the case may be. No. 522 N. indicates the chute 220 feet north of the shaft on the 500 level. Crosscuts should be indicated by the letter X, as suggested by Mr. Alderson, and there is not much likelihood of the letters of the alphabet

being exhausted by multiplicity of veins worked by this system. The plan is merely suggestive and may be elaborated as much as the necessity of the case or the ingenuity of the superintendent may determine. MINE SUPERINTENDENT.

Pump for a Cyanide Plant.

In a cyanide plant is used a circulating pump to carry the cyanide solutions, after passing through the zinc boxes, back to a level above the charging tanks. The accompanying illustration shows a centrifugal pump arranged for such work. It is connected to a gas engine by machine-cut gears, the whole being self-

Pump and Gasoline Engine for Cyanide Plant.

contained on a cast iron base. The engine will develop 2¼ H. P. (1¾ H. P. guaranteed) and can be run with either gasoline or distillate. It is equipped with magneto sparking dynamo, oilers and wrenches.

The pump is a 2-inch centrifugal, having a capacity of from 75 to 150 gallons per minute, depending on the height to which the solution is raised. The cut shows the circulating water pipes from the engine cylinder, connected with the pump (this is where clear water is pumped.) When cyanide solutions are handled these pipes are connected with the water main, and the pump outlets for such plugged. Further information as to shipping weight, prices, etc., may be had from the Hercules Gas Engine Co., 163-167 First street, San Francisco, Cal.

A Montejus and Filter Press for Cyanidation.

Written for the MINING AND SCIENTIFIC PRESS by DENNIS H. STOVALL.

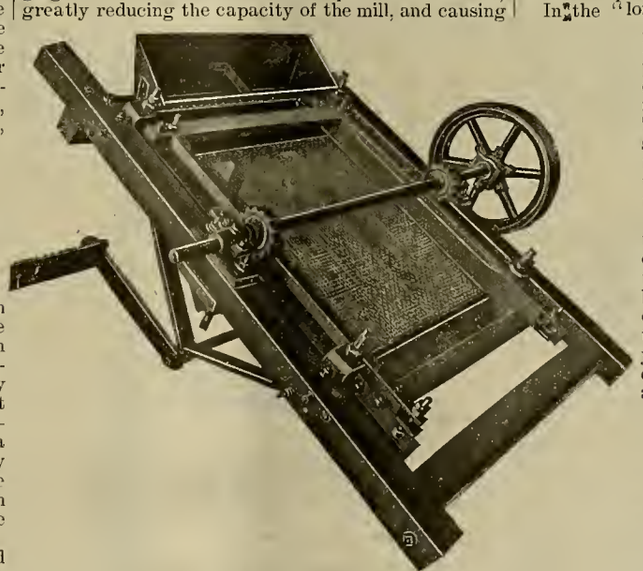
In recent years there has been quite an innovation in methods of extracting gold from pulverized base ores or tailings. This innovation has largely been in the nature of filter presses, as a valuable and additional agent in the treatment of pulp and slimes by the cyanide or other processes of extraction. At the Greenback mine, southern Oregon, Superintendent C. W. Thompson has placed in commission a cyanide plant that goes one step farther than any other process used in the mines of this part of the West. This is a montejus and filter press. Through the agency of this plant Mr. Thompson is able to save at least 95% of the assay values of the ore.

The montejus and filter press were manufactured in Germany and set up at the Greenback mine at a considerable cost, but it is proving a good investment. The filter press feature of the plant is but little unlike other filter presses that have been introduced in the mines of America, Australia and New Zealand, but as far as the writer is informed no other mine in America has yet introduced the montejus. This latter machine, in its single piece, weighed five tons, and resembles a huge boiler. It was set on end and buried in the ground till but a small part of its upper portion remains above the floor of the mill. (See illustration frout page). The route of the tailings, after leaving the concentrators, is first to the sump tanks, thence to the montejus, whence they are forced to the filter press.

The large pipe shown in the illustration, running from the top of the montejus to the right, connects with the sump or slimes tanks, and another running out of the tank higher up connects with sand tanks. The arrangement for filling and discharging is automatic, being operated by compressed air.

In the cyanide plant of the Greenback mine there are three sand tanks and four slime tanks. The tailings are conveyed from the concentrators, being first separated from the slimes, to the sand tanks. Each sand tank has a capacity of 150 tons, and are so arranged that while one is filling one of the other two are being discharged. The montejus and filter press treat not only the tailings sands, but the slimes also, and each are conveyed by gravity to the montejus, entering it near the top through a large valve. When the montejus is full this valve closes, and the method of emptying it and forcing the pulp to the press is by compressed air supplied by the air compressors in the stamp mill. The air enters through one of two valves, one that has a pipe leading nearly to the bottom of the montejus, and the other only into the top. The pipe leading to the bottom is for agitation, such being necessary at times when the pulp cakes, or becomes too solidly packed. The air under pressure forces the contents of the montejus out through a large pipe that also leads nearly to the bottom of the tank, and through this pipe the tailings and slimes are forced to the filter press, under a pressure of from a few pounds up to eighty pounds per square inch.

The filter press is made up of a series of filter frames, set side by side, and each cored internally with slots, with perforated steel plates between them. Each of these frames set and revolve on a common axis or shaft, and each are provided with convenient handles or hand holds, making it an easy matter to manipulate them. The corings of each filter frame snugly coincide, thus allowing a common passage for the flushing fluid, for charging the chambers, and for the compressed air.



At one end of the frame is arranged a ratchet and wheel lever, with a powerful fulcrum by which a man can easily apply the pressure necessary to operate the press.

The method of treating the wash fluids after they have passed through the tailings cakes in the filter frames is identical to that followed in any cyanide plant.

Impact Screen for Ores.

One of the difficulties which is frequent in ore reduction is the screening of the ore after crushing, and particularly is this the case if the ore be wet and of a clayey nature. In the use of tromme ls this is often the case. When the ore is screened dry a large amount of dust is created, which in some ores is not only disagreeble, but dangerous, as in the case of lead ores. In this class of ores when they are wet, the clogging of the screen is of frequent occurrence, greatly reducing the capacity of the mill, and causing much loss of time. When a screen does not properly perform its function, that of sizing the crushed ore, the under size which should have passed through the screen is returned to the rolls overloading them, causing additional loss of capacity and consequent expense. A revolving screen finer than ten-mesh requires much attention and is a source of much annoyance.

To overcome this difficulty with clogging of scrense the Colorado Iron Works of Denver, Colo., has devised a flat screen, designed to work on any class of ores. This screen has a vertical motion at right angles to the plane of the screen surface, the motion in other screens being horizontal, or practically in the same plane as that in which the material is traveling. The vertical motion is designed to keep the screen free, and to permit the largest possible capacity. The construction and operation of the screen is illustrated in the accompanying engraving.

Impact Screen for Ores.

Standardizing of Methods of Chemical Analysis.

In a paper read at the recent meeting of the British Association at Belfast, B. Blount enters a protest against the present tendency toward standardization of methods of chemical analysis, on the grounds that the conscientious chemist seeks any way to employ the methods that are most nearly accurate, that the employment of various methods that are equally good furnishes a valuable check on the results, that the adoption of standard methods not known to be absolutely correct will simply perpetuate imperfections and discourage investigations toward improvements, and finally that independent consulting chemists, who may refuse to submit to dictation even from a committee of their peers as to the methods they are to employ, will be put at an unfair advantage before the public, and especially before courts of law. Mr. Blount admits, however, the desirability of revision of analytical methods, and considers it a proper function of a committee, acting under some central body, to examine and report on old methods and recommend new ones; but the reports of such committees should merely be critical and advisory, and no attempt should be made to erect a standard method. The object aimed at would be to insure that the methods examined and finally approved should be both reliable and practicable. In that way real analytical progress would be effected.

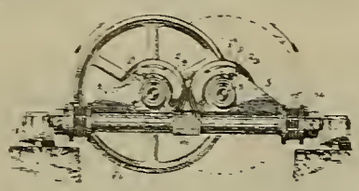
Order of Drop of Stamps.

TO THE EDITOR:—The order of drop of stamps is of great importance. Thirty years ago we used to hear it said that five stamps in a battery was the proper thing, because this number could be so arranged that no two adjacent stamps would drop consecutively. Accordingly the cams were generally so placed on the shaft that the order of drop was 1, 3, 5, 2, 4; but with this order of drop the pulp has always banked up under Nos. 1 and 2, and no arrangement of feeding or increase of drop of one or two stamps or distribution of water will entirely remedy the difficulty. But this order still continues in some places because the theory is correct. The order 1, 4, 2, 3, 5, or 1, 5, 2, 4, 3 is better, though not perfect. With dies much worn, and discharge correspondingly higher, the difficulty becomes more pronounced, and I have repeatedly found that by holding a square-edged receptacle before the screen frame, and drying and weighing the result, that No. 5, with 6 inches drop, forced more pulp through the screen than Nos. 1 and 2 together, having 8 and 7 inches drop respectively.

In the "long ago" I ran a 3-stamp mill on the American mine. The order of drop was 1, 2, 3. It could not be otherwise. The pulp banked up under No. 1. In later days, I operated a 4-stamp prospecting mill—light stamps, but rapid drop. The order was 1, 3, 2, 4. The pulp seemed to distribute itself uniformly through the battery and the discharge was uniform. There was nothing more to be desired in this behalf.

I believe, but am not able to prove, that a 4-stamp battery with this order of drop will crush more ore, other conditions being the same, than a 5-stamp battery with any order of drop that can be given it, and I predict that those who build mills, say twenty-five years hence, will find that a change has occurred, and that 4-stamp batteries are the rule. MILL MAN.

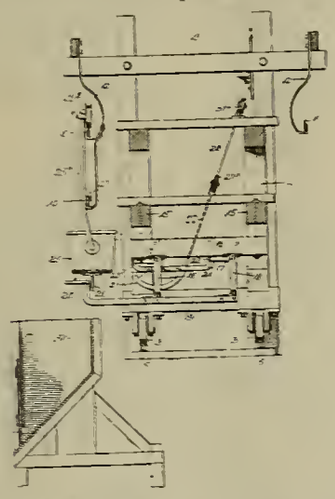
Ammonal, a New Explosive.



The latest in explosives, according to Metal Industry, is powdered aluminum, mixed with nitrate of ammonia, and put upon the market under the name of "ammonal." This explosive is said to be one of the surest and safest known, as it can not be exploded by friction or blow, while otherwise containing all requisites of an explosive. The fact that aluminum is not affected by nitric acid gives the important property to ammonal of not being subject to disintegration. As it is not affected by frosts, accidents which so often occur when thawing out frozen dynamite are not to be feared. The explosion is caused by an ordinary cap. Another important property claimed for ammonal is that it is not affected by moisture.

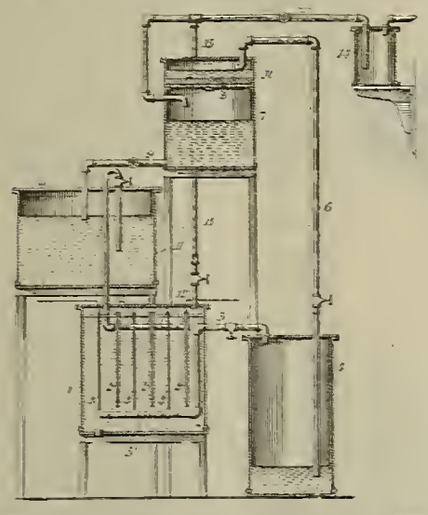
Mining and Metallurgical Patents.

PATENTS ISSUED OCTOBER 27, 1903.



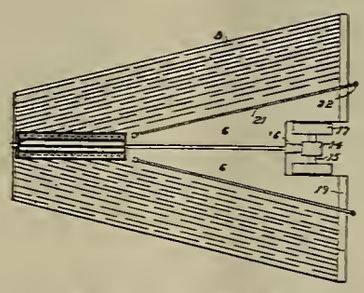
Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

CRUSHING ROLLS.—No. 741,592; W. G. Dodd, San Francisco, Cal.



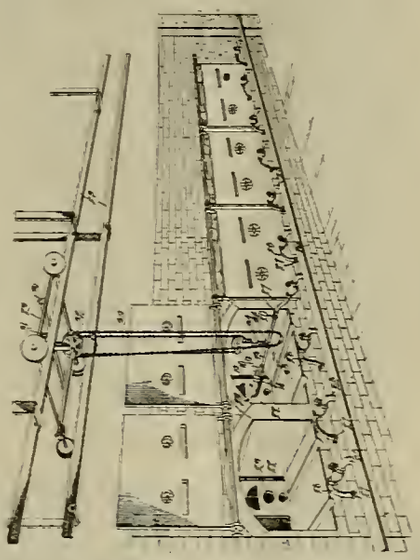
In roller crusher, combination with grinding rolls, of separated rods arranged in same horizontal plane at each side of rolls and between which rolls work, means at respective ends of rods for supporting same, pair of slidable bearing brackets for each crushing roll, each of brackets being sleeved upon pair of rods, means for exerting inward pressure upon bearing brackets, and universal bearings carried by brackets upon which crushing rolls are suspended.

DISCHARGE TERMINAL FOR WIRE ROPE TRAMWAYS.—No. 742,235; B. C. Riblet, Spokane, Wash.



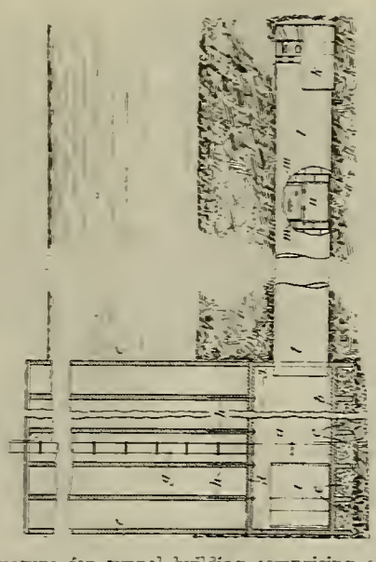
In discharging terminal for wire rope tramways, combination with running and stationary ropes, of movable truck having bucket dumper arranged thereon, bucket guiding rails located below running rope; second movable truck in alinement with first mentioned truck, having sheave mounted thereon, round which running rope passes; semi-circular track, ends of which are extended and have telescopic connection with tracks forming continuations of stationary rope; semi-circular guide rail having extended ends which telescope with guide rails of above mentioned trip mechanism for operating bucket dumper; cable connecting mechanism with dumper, and means for operating trip mechanism.

PROCESS OF ELECTRO-DEPOSITING METALS.—No. 742,442; W. M. Johnson, Hartford, Conn.



Method in subjecting electrolyte in neighborhood of cathode to such pressure as will remove contained gases, and electro-depositing metal therefrom in reguline form.

CONCENTRATOR.—No. 742,510; C. H. Snow, Stockton, Cal.

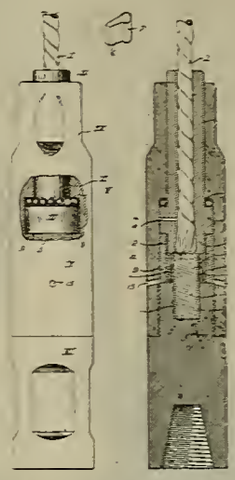


Concentrating apparatus consisting of pair of divergent tables having inner edges hinged contiguous to each other, and outer edges declining therefrom, longitudinal riffles parallel with outer edges of tables, means for independently adjusting transverse angles of tables, mechanism by which longitudinal inclination of tables is simultaneously adjusted, mechanism by which longitudinal concussive movement of tables is effected, pulp-distributing box, means contained therein whereby pulp of different gravity is delivered upon respective tables to be independently treated.

APPARATUS FOR CHARGING AND CLEANING FURNACES.—No. 742,196; T. Jones, Iola, Kans.

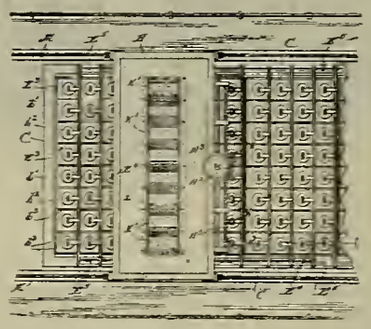
An apparatus for charging retort, comprising holder for containing material to be treated and means for forcing charge from holder without altering position of holder in so doing.

TUNNEL CONSTRUCTION.—No. 742,222; J. F. O'Rourke, New York, N. Y.



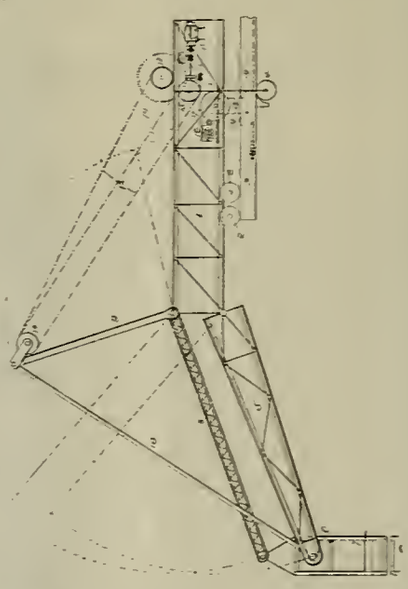
Structure for tunnel building comprising crib or upper portion, working chamber, and intermediate air pressure chamber from which work of excavation can be carried on, air pressure chamber and working chamber forming permanent structure and crib or upper portion being removable from permanent structure.

PROCESS OF TREATING LEAD, SILVER OR ZINC ORES.—No. 741,653; S. Ganelin, Berlin, Germany.



Process for treatment of ores and substances containing metallic oxides, of silver, lead or zinc, which consists in mixing them with molten salt capable of dissolving oxides from the rest of the ore and then separating metallic substances from salt and rest of ore.

RATCHET CLUTCH FOR DRILLING SWIVELS.—No. 742,332; J. Kunny, H. G. Arundell and P. R. Kunny, Los Angeles, Cal.



Drilling spindle comprising swivel rod, cable secured thereto, head on rod, casing inclosing rod and head, antifriction means located between rod and casing, ratchet barrel secured to rod and turning therewith, tool rod secured to casing beneath ratchet barrel, pawl hub secured to tool rod, and means carried by pawl hub adapted to intermittently engage ratchet barrel.

SMELTING FURNACE.—No. 742,406; O. H. Eliel, Lasalle, Ill.

In smelting furnace retort construction which consists in tube having bore open at both ends in combination with stopper adapted to pass into and close bore at distance from end and having cup-shaped flange projecting laterally over bore and provided with annular well adapted to close over end of tube.

SUPPORTING AND CONVEYING APPARATUS FOR ORE SCRAPERS.—No. 742,436; G. H. Hulett, Cleveland, Ohio.

Combination with girder and scraper frame or leg of boom hinged to forward end of girder and hinged at other end to scraper frame and equalizing bar disposed parallel with boom and hinged at its respective ends to girder and scraper frame.

Mining Summary.

SPECIALLY COMPILED AND REPORTED FOR THE MINING AND SCIENTIFIC PRESS.

The annual report of the Director of the Mint shows the following is approximate distribution by producing States and Territories of gold and silver in the United States for calendar year 1902:

	Gold, Value.	Silver, Coining Value.
Alabama	$2,500	$125
Alaska	8,315,800	118,950
Arizona	4,112,300	2,931,513
California	16,792,100	1,164,671
Colorado	28,468,700	20,267,960
Georgia	97,800	5,517
Idaho	1,457,000	7,569,842
Maryland	2,500	.....
Michigan	.....	257
Montana	4,347,000	17,123,297
Nevada	2,895,300	4,843,572
New Mexico	531,131	591,137
North Carolina	90,700	27,022
Oregon	1,816,700	120,630
South Carolina	121,900	338
South Dakota	6,965,400	439,855
Tennessee	.....	15,905
Texas	.....	576,905
Utah	3,594,500	11,004,922
Virginia	3,100	7,208
Washington	272,200	800,323
Wyoming	38,800	0,484
Totals	$79,956,031	$71,757,575

The number of fine ounces of gold is given at 3,870,000, and of silver 55,500,000. This is an increase of 64,500 ounces of gold as compared with 1901, and an increase of 286,000 ounces of silver. The total value of the silver produced is $29,415,000, as against $71,757,575, its coinage value.

The estimate of the Director of the Mint of the world's production of gold and silver for the calendar year 1902 is: Gold, total value, $295,889,000; silver, coining value, $215,861,800. Follow are the figures for some of the leading countries:

	Gold, Value.	Silver, Coining Value.
United States	$80,000,000	$71,757,600
Mexico	10,153,100	77,804,100
Canada	20,741,200	5,564,500
Africa	39,023,700	.....
Australia	81,578,800	10,377,100
Russia	22,533,400	265,200
Austria-Hungary	2,171,300	2,432,200
Italy	5,300	1,246,800
Spain	10,200	4,784,100
Greece	.....	1,409,500
Bolivia	4,700	16,798,600
Chile	575,200	4,611,600
Colombia	2,522,600	2,297,000
Brazil	9,994,600	.....
Guiana (British)	1,808,600	.....
Guiana (French)	2,420,200	.....
Peru	2,226,100	5,313,700
Central America	2,001,900	1,255,800
Japan	1,287,000	505,000
China	8,731,800	.....
Corea	3,500,000	.....
British India	9,588,100	.....
British East Indies	1,027,100	.....

As compared with 1901, these figures show an increase in the production of gold of 1,557,914 ounces and a decreaso of 8,042,934 ounces in the production of silver. During the year Africa increased her gold production from 429,704 ounces to 1,887,773 ounces, and Australia increased her gold production to $81,578,000, which is over $1,500,000 in excess of the production of the United States, which again takes second place.

ALASKA.

(Special Correspondence).—The Miocene Ditch Co. of Nome has its water system in operation. The main ditch, which is over 30 miles long, and taps Nome river, is 8 to 12 feet in width and has a capacity of 3000 miner's inches. This, with the branch lines, comprises over 40 miles of diteb. This system covers the district of Dexter, Anvil, Glacier and Snow Gulch creeks, and the adjoining bench mines. A number of these mines require hydraulic gravel elevators to work them. The Miocene Co. installed four elevators on Anvil and Glacier creeks this season, and will take in six of a larger pattern next year.

In the Council district there has been much activity. C. D. Lane & Co. completed one ditch system on Ophir creek, and several gravel elevators were put in operation there. These older districts are getting into shape for successful mining, while the outlying districts are also becoming active. It has been shown that the gold-bearing gravels of the Seward peninsula require construction of ditches to make them producers.

Nome, October 10.

The Alaska Mine Owners and Operators have organized at Juneau, with J. MacDonald, F. C. Hammond, B. M. Behrends, G. E. Bent and W. B. Hoggatt as officers, to promote the mining interests of Alaska.

The plant of the Rodman bay mines at Rodman bay, near Juneau, has been shut down. It is reported the money has given out. A wharf was erected, a sawmill built, 7 miles of railroad laid from the dock to the mine and a 120-stamp mill built, and 800 feet of tunnel driven.

So much rain has fallen during the last of October that the Treadwell M. Co.'s ditch, near Douglas, has overflowed, making it necessary to open the flood gates and fire hydrants to relieve the pressure, says the Juneau Dispatch. The mines, too, are feeling it, the 220-foot level having 3 feet of water. The flood has not greatly retarded work, however.

ARIZONA.

Gila County.

The consolidation of the United Globe mines, owned by Phelps, Dodge & Co., with the Old Dominion C. M. Co. is reported closed. In consideration of the issue to them of 130,000 shares of stock Phelps, Dodge & Co. transfer their Globe mining property to the Old Dominion Co. and also pay $350,000 in cash. The agreement carries with it control and the Old Dominion will be known as a Phelps-Dodge company. The president of the consolidated company is J. Douglas, with C. S. Smith vice-president and C. H. Altmiller treasurer. The offices of the company will remain in Boston. One smelting plant will be erected for both properties at Globe.

Graham County.

The New England C. Co. and the Clifton Con. C. Co. at Clifton have been consolidated under the name of the New England & Clifton Con. C. Co.

Maricopa County.

(Special Correspondence). — The Gila Gold Lode Co. has men doing development work on the group in the White Tank mountains north of Buckeye. The ore is free milling, and a stamp mill will be built. Water available for mill use has been struck in sinking a shaft on one of the claims.——J. G. Hardin says he has put on more men at his gold and copper mine near New river to increase development work.——The Mormon Girl mill at Cave creek is being put in shape for operating. There are twenty-five men at work in the Mormon Girl mine taking out ore.

Donofrio & Eddie are working on their property near Frog Tanks and are considering reduction works.——H. Welch and W. Dunn are supplying the mill at Buckeye with ore from their claims in the White Tank mountains.——At the Fleming mine, near Cave creek, it is proposed to build a stamp mill, as considerable high grade free milling ore is on the dump and development is progressing.

The lessees of the Vulture dump near Wickenburg expect to have their cyanide plant in operation this week. These tailings have been cyanided before.

G. Hamlin, of the Relief mine, 15 miles north of Peoria, says they are preparing to put in a 10-stamp mill.——The Pike's Peak G. M. Co. will resume operations on its group west of Frog Tanks. E. Hewins is superintendent. A pump will be put in to unwater the deepest shaft.

J. H. McCabe has bought the Wickenburg smelter and removed it to his property north of Phœnix. This is not the smelter built at Wickenburg this summer, which is in operation.

The Arizona M. & Dev. Co. expects to begin work near Morristown this week. They have bought the Ryland, or Black Jack mine. This was formerly a producer of silver-lead ores.

The La Gloria Co. is operating in the White Tank mountains south and west of Beardsley. They have built a wagon road from their property to Beardsley, the railroad station.——It is reported that J. L. Slusher, of St. Louis, Mo., has bought the Anglesite mine near Hot Springs Junction.——G. Carguile is working his claims in the Cave creek district. The ore is free milling.

Wickenburg, Nov. 2.

Mohave County.

At Mineral Park, Superintendent J. Detar of the Queen Bee mine, says the Keystone group of mines has been taken over by the Queen Bee M. Co., who will put in a hoisting plant on the White Copper mine, covering the copper outcrop near the Mineral Park mill, and a shaft will be sunk to depth of several hundred feet. The company will also start work on the Keystone mine.

The hoisting plant for the Treasure Hill M. Co., near Kingman, is being set up. The shaft is down 140 feet and it is proposed to sink it to 200 feet, and then crosscut the Dictionary and Time Check veins. One of the veins on the surface carries high values in silver.

Pinal County.

W. S. Fletcher, having bought the Weedin-Bouvielle lead-silver mines at Mineral Hill, known as the Golden Quiver group, will build a 60-ton smelting plant on the Gila river, near Florence, for the treatment of ores of said group and also for treatment of gold concentrates and gold ores, which he will ship from his gold mines in Mohave county, says the Florence Blade. There is a 5-stamp mill on one of the gold claims and this will be converted into a concentrating plant.

Yavapai County.

The United Verde C. Co. of Jerome will build coke bins of capacity of 100 standard gauge cars at Jerome Junction. Material for an oil tank is on the ground. The tank will have a capacity of 178,000 gallons.

H. B. Fowler, of Mayer, of the Rigby Reduction Co., says the plant to be of capacity of 100 tons per day will be ready to reduce ore by Jan. 1st. He expects to save all the gold and silver, and 95% of the copper.

CALIFORNIA.

Amador County.

The last annual report of the Oneida mine, near Jackson, shows that the mine has been operated at a profit the past year.

Calaveras County.

At the Forty-nine mine at Douglas Flat a steam plant has been put in, and is in operation, as they had only water enough to keep the pumps running.

El Dorado County.

The El Dorado Republican says the Sierra M. Co. of Arizona has bought the Mt. Hope group of mines near Grizzly Flat.

F. B. Norton of Auburn, Placer county, owning asbestos deposits in El Dorado county, proposes to make firebricks by grinding up the fiber and then moulding it under pressure.

Fresno County.

The Pennsylvania Oil M. & Dev. Co., Commercial Petroleum Co.. and Section Seven Oil Co., each began drilling additional wells last week at Coalinga.——The Pleasant Valley S. F. Co. spudded in its No. 2 last week. No. 1 well is in the sand.——The Giant Oil Co. has been reorganized as the Coalinga-Banner Oil Co.

Kern County.

The California-Kern Oil Co. last week broke ground for its refinery at Kern river, near Bakersfield. The plant will be on the property leased from the Grace, adjoining the Petroleum Dev. Co. and the Junction. The property has several completed wells.

At Sunset the Monarch Oil Co. has two strings of tools in operation, and is arranging to put in machinery for five more rigs.

The Pinmore 5-stamp mill at Johannesburg was destroyed by fire on the 31st ult. The fire is thought to have been of incendiary origin. The property was owned by the Crœsus M. Co., and was leased to W. F. Earnst and A. C. Nelson, who were operating it.

Madera County.

The plant at the Gambetta mine, at Grub Gulch, is being increased by addition of machinery from the Garibaldi mine on Bull creek, Mariposa county. When completed, the change will give the Gambetta twenty stamps and two Huntington mills. The working force is to be increased. Sinking below the 800-foot level is progressing. The property includes the Josephine mine, worked to a depth of 300 feet. J. E. Porter is superintendent.

Mariposa County.

The Armstrong mine, near Indian gulch, will be opened. This mine is owned by R. M. Hotaling of San Francisco and U. Roy of Merced. They will repair the 56-foot shaft, and put in a hoisting plant.

W. M. Darling of Alameda says operations are being resumed at his Copper Hill mine, near the Armstrong mine, near Indian gulch. He has a shaft down 60 feet and will sink to 100 feet.

The Pocahontas mine at Whiterock, owned by J. Waller of Le Grand, is being worked by C. and S. Wilcox of Whiterock. They are shipping high-grade ore.

A strike is reported on the Barley Field mine, near Mariposa.

The discovery of copper ore, carrying gold and silver, is reported made near the Hotaling ranch, near Indian Gulch.

Mono County.

The New Bodie M. Co. has been incorporated at Provo, Utah, by C. E., W. D. & W. A. R. Loose, R. Smoot and J. R. Twelves. C. E. Loose is president. The company owns a group near Bodie, including the Cluff, Arthur, Sunshine, Eva, Hillside, Coarse gold mining claims and the Miners' millsite and water rights.

Nevada County.

The Huron and Red Cross mines, near Omega, which have been consolidated and have arranged to use electricity for power and lighting, will be supplied by the Central California Electric Power Co. from Alta. About 200 H. P. will be required. The line will he 9 miles long.

Plumas County.

W. D. Lawton, superintendent of the Plumas Mines, Ltd., in North canyon, near Greenville, says he has seventy-five men at work, and he expects to have the mill in operation this week. The mine is on north side of North canyon, below the Round Valley reservoir.

San Diego County.

In the Superior Court on the 2nd inst., R. O. Butterfield began action against the American Lithia and Chemical Co., of New York, et al. for annullment of certain deeds and transfers to the lepidolite and amblygonite mines at Pala. It is claimed by Butterfield that W. H. Crane has received transfer for property, has formed the corporation and has deeded the property to the corporation without doing any of the other things promised and without making returns to the original owners.

The mill at Cuyamaca on the Stonewall mine has been started up after several years of idleness. The mine is opened to a depth of 600 feet, though it has been flooded for ten years. It is intended to unwater the mine and prospect it to greater depth. The quartz occurs as lenses in schist. H. S. Lucas is manager. The mine was a large producer in the past.

The gold mines near Banner are being developed.——The main shaft of the Rancbita mine, near Banner, is being retimbered.——The Helvetia mine, near Julian, is sinking a new shaft—now down 165 feet.——It is reported that lithia mica (lapidolite) has been discovered near the San Felipe on the border of the Colorado desert, about 10 miles from Banner.

Santa Clara County.

The Watsonville Oil Co. have perforated two strata of sand at well No. 3 on the Sargent ranch, near Sargents, striking oil, which gushed to height of 60 feet. It is estimated the well will furnish 200 barrels per day.

Shasta County.

The Mountain Copper Co. at Keswick will send to the St. Louis Exposition a mass of copper ore which weighs 1000 pounds. It was taken from the mine this week and shows native copper. An iron stand is being made on which the specimen will he set.

Shipments of gold-bearing quartzose ore for treatment at the Keswick smelter are being made by mines in Salt Creek district. A train, consisting of twenty-two standard-gauge cars, was hauled by the Southern Pacific from the Middle Creek station, 2 miles north of Redding, last week. This shipment included ore from the Mountain Lion mine, the Paulsen, Hiatt and Kembler mines, the Connor and the Muchmore mines. Seven cars of assorted ore remained on the platform awaiting shipment. Fifty cars of ore were shipped during the week.

Sierra County.

Superintendent Finney of the Telegraph mine at Fir Cap says, owing to the improvement in the values of the ledge, the 10-stamp mill will be increased.

Siskiyou County.

(Special Correspondence).—The mining suit of Music vs. Tetherow has been compromised for $1000 cash and $2000 without interest, payable September, 1904. At the Knownothing mine, Superintendent Roberts has opened up ore and repaired one battery of four stamps. He intends to begin crushing this week. Later both 4-stamp batteries will be put in operation.

C. P. Richards has leased part of J. D. Hubbard's cyanide plant at Rollin and is setting it up at the Black Bear mine to work up a dump of mill tailings below the mill. Superintendent J. Daggett of Black Bear will resume operations at the mine next week.

The Yreka M. & M. Co. has shut down its mine and plant indefinitely. The company has annually lost part of its property through lawsuits and has little left to operate on.

Superintendent W. H. Young of the King Solomon mine has let contracts for several hundred feet of tunnel to open up new ground. After this is done, they will put in a milling plant.

Rollins, Nov. 2.

The Van Brunt (Ah Ock) mines, near Happy Camp, near Yreka, are yielding returns, says Superintendent D. J. Jackson, and development work will he increased. —— The McKean quartz mine, near Callahans, has been shut down for the season, and work will be resumed in the spring.

Trinity County.

The work of running the tunnel from Bear creek through the mountains to the Globe mines, near Weaverville, is progressing. There is still 1000 feet to run before it will he completed. The tunnel is being run to work the Globe from the Bear creek side, fuel and water being easily obtainable at that point.

The Enterprise mines on east fork of Trinity river, near Weaverville, are being developed. The lower tunnel on the Lone Jack mine is in 1200 feet, says the Journal, with an ore shoot 700 feet long. The vein is from 2 to 3 feet wide, and averages $8 per ton. In the Enterprise a vein 6 feet wide runs $15 per ton. A recent test

run during a month returned $4500 in the 10-stamp mill. M. Mauley is superintendent.

The dredger on Weaver creek, near Weaverville, is to resume operations, under direction of E. A. Wakeman.

Tuolumne County.

The mill at the Golden Era mine, near Columbia, has been repaired and put in operation. —— Sinking on the vein continues at the Altadena mine.

Operations have been resumed at the Doyle gravel mine, near Columbia.—— O. M. Rising has bought the Rising Sun, New Discovery and Senorita quartz claims near Arastraville, near Soulsbyville.

The Providence mine, 3 miles from Carters, is working steadily, employing forty men.

The Doyle drift mine, near Columbia, is working, says the Sonora Banner, twelve men being employed on contract.——A shortage in the water supply has tied up a number of mines in this county and others are running on short time.—— O. M. Rising has bought the Rising Sun and Senorita quartz mines at Arrastraville.——It is reported the Nichol Bros. are to resume work on their mine on the Yost ranch, 1 mile south of Soulsbyville.

COLORADO.

(Special Correspondence). —The machinery and supply houses of Denver report an increase in business. A large portion of their trade is coming from outside of the State, but matters are looking better in Colorado than for some time. The strike has not been settled and there is no likelihood of the operators making or receiving any overtures for settlement, as they seem to be able to run without aid of the Western Federation. A considerable number of the striking miners have left Cripple Creek district and their places are being filled by others coming in. The mills throughout the district are starting up.

Denver, Nov. 3.

For the month of October the gold receipts at the Denver branch mint aggregated $783,550.72, as compared with $1,300,806.05 for October, 1902. The decline is traceable to the closing down of the mills at Colorado City, Florence and Telluride.

Boulder County.

The Anchor mine, on Bald mountain, northwest of Caribou, has been shipping ore all summer. The ore is a copper-lead sulphide carrying gold and silver. The vein is 5 feet wide, with a pay streak 18 inches wide. The company last week shipped nine tons, which netted $1030. The property is under the management of C. R. Wolff of Boulder. They are planning to put in additional machinery.

The addition of Otero No. 5 to the list of oil wells sunk in the Boulder belt near Boulder raises the output to 200 barrels per day, says the Eldora Record. The Otero No. 5 is pumping sixty-seven barrels per day. This company is shipping 110 barrels daily; the Savannah 40 barrels, Boulder-Valmont 10 barrels, McKenzie 2 barrels, Boulder Valley and Two Ten 5 barrels, and the McAfee, Wellington and others are pumping occasionally. One dollar per barrel is received from the United Oil Co. The cost of pumping is nominal. The last Otero well is 1780 feet deep and cost $3000.

J. P. Clark, manager of the Corona M. Co., which operates the Black Cloud mine, near Salina, says they propose to build a mill to treat its ore at the mine instead of sorting and shipping to the smelters.

Clear Creek County.

C. H. Fogg of Boston, Mass., has resumed work on the Gomez mine, on Soda creek, near Idaho Springs. The shaft is down 220 feet and levels have been driven. The shaft will be deepened.

It is reported the Hyland M. & M. Co. will build a mill on the site of the old Humphrey mill near Idaho Springs. Nothing remains of the Humphrey mill but the building, which will be torn down. The Hyland M. & M. Co. owns a group of claims, including placer and mill sites and water right. The work under way for the Hyland consists of building a dam and headgate below the Stanley power house. The spillway will be 56 feet across the creek. A steel pipe line will be substituted for the open flume formerly used. The flume is to be 2500 feet in length and will have a head of 30 feet.

The Con. G. & S. M. Co. has its Consolidated Alpine mill, near Idaho Springs, running full time. This is said to be the only mill in the district in which Frue vanners are used. Manager Crow says tables will also be put in.

Superintendent Babcock of the Southern M., M. & D. Co. says operations on the group recently acquired near Argentine are being started. In addition to the Poor Man's Relief, Evening Star and four other claims, the company has an option on a number of claims contiguous to these. A tunnel 1000 feet in length will cut the Evening Star and Poor Man's Relief at depth.

Connections have been made by the raise from the tunnel level on the Wide West mine, near Georgetown, with the upper workings of that property. The raise is 300 feet in length and connects with a drift driven from the bottom of the 85-foot shaft. The mine is owned by H. Seifried of Georgetown. It is understood the mine will hereafter be operated under the leasing system, says the Courier.

C. H. Morris is resuming operations on the Mexico group of claims, near Silver Plume. Considerable development work has been done. As the tunnels and drifts are in some distance, ventilation will be obtained by making connection with a shaft sunk on one of the veins from surface.

Manager Stevens has men at work at the Stevens mine, near Silver Plume, on construction of concentrating mill. The mill will be operated by steam, as water is not available during greater part of year for power purposes. The mine is equipped with steam machinery. The mill will differ from the Terrible and Mendota mills, in same district, as no jigs will be used, concentration being effected by use of tables.

Custer County.

Superintendent J. Fitzgerald of the P. & O. mine, near Westcliffe, reports at 500-foot depth, in drifting, a lead has been struck 4 feet in width, carrying tellurides with gold and silver values. Free gold is also shown.

El Paso County.

The directors of the Golden Cycle M. Co. of St. Louis, Mo., operating at Cripple Creek, have decided to build a reduction works at Colorado City to cost $300,000. The cyanide process will be used. Manager L. E. Hill is prospecting the mill site for a water supply. The Telluride mill adjoining has been able to develop all the water needed by the plant on its own ground. The site for the reduction works comprises ninety-six acres south of the Telluride mill, between the Colorado Midland tracks and the Short Line spur. The plans are being drawn for the plant, and the initial capacity will be 300 tons per day. The present production from the Golden Cycle mine is 150 tons a day. The mill will employ about 125 men a day, and when completed Colorado City will have five reduction works.

Fremont County.

Twenty-six carloads of machinery have been shipped from the Metallic mill, north of Florence, to Utah, where the mill will be rebuilt by the United States R. & R. Co., near its DeLamar group of low-grade copper mines at Bingham. There remains but a few carloads of the dismantled mill to ship.

Gilpin County.

The concentrating plant of the Franklin Extraction Co., on North Clear creek, east of the Black Hawk depot, is in operation. The main building is 54x90 feet, and equipment includes a 40 H. P. engine and 70 H. P. boiler, with twelve concentrating tables, sizing and settling tanks.

Colorado parties have a lease and bond on the Pozo property in Nevada gulch, near Central City, and A. W. Rucker, superintendent, is unwatering the workings. The ores carry zinc and lead values.

McLeod & Brown, of Central City, have a lease and bond on the Quartz Mill lode, in Leavenworth gulch, near Central City, and have started sinking, the shaft being down 80 feet. They report a streak of copper-iron and lead ore coming in on the hanging wall side. They have a whim for hoisting.

The Avon M. Co. is building a tramway from its Avon mill to the mouth of the Boston tunnel on Quartz hill, near Central City, and the ores from the San Juan mine of this company will be taken out through the tunnel and trammed to the mill.

Larimer County.

The interests of the Big Creek M. Co., the Big Horn M. Co., the Round Top M. Co., the Pearl Townsite Co., and other interests in and around Pearl, near the Wyoming line, have been consolidated under one management. C. G. Knapp and G. W. Beck of Chicago, Ill., are at the head of the merger and propose to build a smelter at Pearl.

Mineral County.

The Del Monte Leasing Co., which is working the New York-Chance and Del Monte mines near Creede, is shipping 3000 tons of silver ore to the smelters per month. ——The Commodore mine, which adjoins the New York on the south, is a silver producer, and they are putting on additional men and will increase its output.

At the mines operated by the Del Monte Leasing Co. near Creede, Superintendent H. Lees says he will increase the output. This company shipped 3000 tons of ore in September, and has ore reserves which will enable it to mine from 4000 to 5000 tons per month.

C. Miller, manager of the Amethyst mine near Creede, says Superintendent Ulman will increase the shipments. Creede ores are said to be in demand for fluxing sulphide ores and copper matte, and the smelters have reduced the working charges until, with silver at 60 cents an ounce or better, 25-ounce silver can be mined at a profit.

Ouray County.

The Camp Bird M. & M. Co., at Camp Bird, has 300 men at work. This number will be increased when the shaft being sunk on the vein some distance from the portal of the tunnel to add to the stoping ground is completed.

San Juan County.

The Gold Prince M. Co., of Maine, has started operations at its group in Mastodon gulch. They will build tram lines and a 500-ton mill at Animas Forks, near Silverton. The Gold Prince tunnel, to cut the Sunnyside Extension, Mastodon and other veins at depths varying from 500 to 1000 feet, is expected to be producing ore by next June.

Magnetic separators are being put in by Manager Warner at the Silver Ledge mill at Chattanooga.

San Miguel County.

The Keystone Hydraulic Co. proposes additional improvements this winter, after the water supply for washing purposes becomes exhausted. In several places above the gravel pit, where the principal work is done, during high water the river overflows its banks and fills the pit. A flume will be built to carry the water past these places, and the sluice line from the pit down to the river will be remodeled. Water which is used for hydraulicking is drawn from storage reservoirs. As soon as this source of supply diminishes the sluices will be cleaned up.

Summit County.

At the Monte Cristo group on Mount Quandary, 10 miles from Breckenridge, Manager Cooper of the Quandary Mountain M. & M. Co. says they will put up a milling plant. Much of the upper wall of the Monte Cristo vein has been scored off and the ore has been left so that it can be quarried out. The ore is complex and contains gold, silver, iron, lead, copper, zinc and some antimony. The mill will have capacity for treating fifty to seventy-five tons per day.

G. C. Smith of Breckenridge has a bond on the Northern Star lode in McCullough gulch section. The property is on McCullough mountain, 2 miles from the mouth of the gulch, near the Bondy lode. An adit tunnel is being driven in on a 2-foot pay streak. When roughly sorted, the ore, which is an auriferous iron sulphide, with some copper, is reported to run $60 per ton. A main working tunnel will be started from a flat 500 feet below the present tunnel.

The Senator M. & M. Co.'s group on North Star mountain, in upper Blue River district, near Breckenridge, will be developed by a tunnel, which will start on right bank of Blue river. The tunnel will be a crosscut for several hundred feet until the vein which was opened in the tunnel above is cut, and will follow the vein. The ore is an iron sulphide. M. M. Howe is superintendent.

The Morning Star and Young America lodes, above timber line on Mount Baldy, near Breckenridge, have been leased for three years to Mitchell, Slingerland & Case, who are working the Double Extension group, which contains extensions of veins to southwest of Young America and Morning Star lodes. Present operations are confined to driving the 110-foot tunnel of the Double Extension on the 2-foot pay streak. The vein is 3½ feet between the walls, which are trachyte. It is estimated that when tunnel enters the end line of Young America or of Morning Star it will be 300 feet below surface. The ore is said to run $40 per ton.

Teller County.

The Sunset-Eclipse mine, near Cripple Creek, is shipping ore from the shoot recently struck. The strike was made 1200 feet from the main shaft.

Near Gillett, there are three cyanide mills in operation, two in course of construction and others being planned, says the Cripple Creek Times. The Bedford M. Co., which owns property on Cow mountain, will build a plant. The ores of Trachyte, Cow and Sheep mountains are amenable to cyanide treatment.

The October output of Cripple Creek district was 35,050 tons, valued at $964,000. The following figures obtained from the mills and smelters show a net gain over the preceding month of 12,900 tons, with an increased valuation of $362,800. During month of September the production of the district was 22,150 tons at total valuation of $601,200. The output of October is over one-half of the amount produced during July, when all the mines in the district were running with full crews and there was no labor trouble to disturb them. The following is October output:

Plants.	Tons.	Total.
U. S. R. & R. Co.	12,000	$300,000
Portland	9,300	255,750
Smelters	3,500	210,000
Dorcas	2,500	93,750
Telluride	2,000	50,000
Economic	1,500	37,500
Globe	2,600	10,400
Smaller plants, including cyanide mills	1,650	6,600
Totals	35,050	$964,000

The Stratton mining properties at Cripple Creek will be reopened for leasing this week, says the Gazette. This is regarded as an indication that the executors consider the Cripple Creek strike over, inasmuch as the executors withdrew all lands from leasing with the beginning of the labor troubles. When leasing was suspended the executors were letting out the Globe hill properties and had allotted half a dozen blocks of ground near Poverty gulch. The remaining territory on Globe and Gold hills was divided into 150 blocks. The plan announced was that the executors would lease out the Globe and Gold hill holdings before opening the Bull hill holdings for leasing.

It is reported the El Paso mine at Cripple Creek has made a strike in the 500-foot level. Four feet of ore averaging $50 per ton has been opened in the vein near its junction with the C. K. & N. vein, which comes into the main workings from the west. The El Paso Co. shipped 1000 tons of ore in October, half of which was sent out in the last ten days. The drainage tunnel is being advanced to penetrate the eruptive area of the district as quickly as possible in order to open a larger flow of water. At present the tunnel is making 300 gallons a minute, and the several workings of the El Paso 1600 gallons. By the terms of the drilling contract the El Paso Co. has to drive the northeast lateral of the tunnel beyond the El Paso shaft until 1000 gallons of water are made, or until 1500 feet in distance have been accomplished. This lateral has been driven 955 feet and is progressing at the rate of 8 feet a day. The tunnel is lowering the water at the rate of 1 foot a week in the Elkton and Mary McKinney mines.

The manager of the Eagle sampler says he is receiving more ore than he can handle with one shift. This sampler is crushing at rate of 225 tons a day. Another shift will be started next week.—— There is employed on the Stratton's Independence, Ltd., on Battle mountain, 400 men, who are working in two shifts.—— Increased shipments are going out from the district, and it is thought that by Dec. 1 the production of the camp will be back to its old figures. A number of new leases are being granted by members of the Mine Owners' Association, and in every case they contain a clause to the effect that miners employed on the property shall not be members of the W. F. M. If this clause is not adhered to the lease will be canceled.

IDAHO.

Bear Lake County.

J. Richardson of Salt Lake City, Utah, reports developing a group of copper-bearing prospects near Montpelier.

Custer County.

P. L. Fearn, manager of the White Knob C. Co., reports the smelter running steadily, handling 300 to 350 tons of ore a day. It is turning out 15,000 pounds of copper daily, 800 ounces of silver and 20 ounces of gold.

Idaho County.

A. C. Jamieson, of Spokane, Wash., has bought for Eastern and Seattle parties the Tip Top and Solo mining claims in Buffalo Hump district. Men have been put on development work.

L. Schissler reports cleaning up $280 in gold bullion, the result of a two days' run with a prospecting mill on the N. P. mine at Newsome creek, near Stites. The cleanup came from six tons of ore.

The Jumbo mill, at Buffalo Hump, is in steady operation with satisfactory results. The clean-up at the end of thirty days' run is reported to have yielded $14,000 in gold, being $1000 for each stamp.

The Granite M. & M. Co., Ltd., has been incorporated at Lewiston by C. R. Osmers, E. and J. N. Mounce, T. Parks, C. C. Phillips, J. F. Atkinson and W. J. White. The company owns three claims in Buffalo Hump district. The ground is near the Big Buffalo mine. Development will begin this week.

Lemhi County.

H. G. King, president of the Winnie M. Co., reports work progressing on the Winnie mine in Spring mountain district, south of Fort Lemhi. He is blocking the ore body which carries galena. An aerial tramway has been built.

Owyhee County.

The shaft of the Afterthought mine, near Silver City, has reached the 450-foot mark, and they are cutting a station preparatory to drifting on the ledge.

Shoshone County.

A strike is reported made in the shaft of the King mine, near Murray, last week. The ledge is 1 foot wide, carrying free gold and auriferous sulphides.

It is reported a mill is proposed for the O. K. mine, near Wardner, owned by E. O'Neill of Wallace and A. Burch of Spokane, Wash. Over 3200 feet of development has been done. On the 225-foot level the ore shoot was opened for 300 feet and a raise of 187 feet made through ore to an upper tunnel. The company then sank to the 400-foot level, crosscut to the ledge, and oponed an ore shoot 60 feet long. Drifting is under way.

The Frisco mine and mill at Gem are closed down indefinitely.

A company has been organized at Wallace by F. F. Johnson, C. C. Titus, H. J. Rossi, J. C. McDairmid, C. D. Jones, H. E. Howes, J. W. Tabor and J. L. Batterson to take over the Douglas group in Pino Creek district. Preparations are being made for development during the winter. The Douglas has 1000 feet of tunnels opening it to depth of 400 feet. The lowest tunnel was driven 600 feet on the ledge and the ore shoot averaged 3 feet wide. Assays show 25 ounces in silver and 28% lead. The company plans to sink 200 feet at 200 feet from the mouth. There are seven claims in the group.

The option held by G. Turner on an undivided three-eights interest in all the mining claims constituting the Mammoth group, near Wallace, together with water rights and concentrators, for $1,500,000, was closed last week and a deed of transfer of the property from Turner to the Federal M. & S. Co. was filed. This conveys the interests in the Mammoth, not originally owned by the Standard M. Co., and makes the Federal company sole owner.

Washington County.

The cyanide plant near Bear, owned by the Salzer-Ford M. Co., is reported to have been destroyed by fire on the 31st ult. The mill had been running at full capacity.

The American S. & R. Co. has taken over a group of five claims on Iron mountain, 26 miles from Weiser. The ores carry gold and copper values. The price is reported at $150,000. The group is well developed.

MICHIGAN.

Houghton County.

Workmen digging in a water pipe trench in West Hancock last week uncovered an amygdaloid lode, with copper values. As this is west of the Hancock M. Co. property the find is thought to be a new lode.

The Calumet & Hecla has the diamond drill in operation on the Kearsarge lode, 1500 feet south of the exploratory shaft started by the company on that lode near Calumet. An extensive system of ditching is being put in by the Calumet & Hecla management to drain the swamp overlying the Kearsarge lode, in the eastern part of the Calumet & Hecla territory. The ditches were started at the north boundary, near the Centennial and Old Colony, and are 3100 feet southward, near the site of the second shaft to be started on this lode. Tho men who were laid off through the accident in the Red Jacket shaft are engaged in this work. ——The Kraus pneumatic head, set up at the Mass mill, Keweenaw Bay, is being tested by the Calumet & Hecla management.

Keweenaw County.

The management of the Phœnix mine at Phœnix is arranging for additional ore cars with the Mineral Rango railroad. The west vein rock house is finished. Double shift began at the Phœnix mill this week, day shipments being from the stock pile and night shipments from the rock house. The stock pile shipments will be kept up until the rock house on the St. Clair vein is completed (Feb. 1st).

Ontonagan County.

The extension of the Mineral Range railroad to the Michigan mine at Rockland has been completed and the shipment of Michigan rock to the Mass mill began.

MISSOURI.

Jasper County.

The injunction granted in the Springfield Federal court restraining the Big Six M. Co. from operating their plants on the S. Duffield Mitchell tract near Duenweg, is in effect and tho six mills are shut down, throwing 200 men out of employment. They will be idle till after Jan. 4, when the case will be argued. The Big Six Co. is composed of J. W. Allen of Joplin, S. A. Stuckey and S. Chitwood of Carthage.

The Gee M. & M. Co., of Joplin, has been incorporated hy W. P. Groth, of St Louis, H. W. & H. E. Gerhe, of Joplin.

The Miguonette mine, northwest of Carthage, is accumulating its ore in the bins.

The Hayseed mines near Joplin, under management of F. M. Webber, are turning out seven tons of oro per nine-hour shift. They have high-grade dirt, ten tons of jack having been obtained in ono shift from thirty-six tons of dirt. They are shipping. A 100-ton mill will he built at this mine.

F. Sponablo has a lease on six lots at Alba and will put down a 5x7 shaft on a drill holo in which a 30-foot body of ore was found. He proposes to build a mill.

Newton County.

Eighty acres of mineral land, 2 miles north of Ritchie, has been leased to R. A. Mooneyham, J. F. Kompor, C. L. Pulver, W. Baker and C. W. Bowman of Carthage, who will begin development this week. It is half a mile west of the Naulty mine aud mill, owned by J. A. Mitchell, H. M. Cornoll et al.

A boiler, crusher and rolls have been added to the Seven Devils M. Co. mill at Carl Junction. The output from this mine is increasing.

MONTANA.

Granite County.

Kaiser Bros. & C. Williams, in thoir mine on Red Hill, near Phillipsburg, report striking ore carrying silver and copper.

The mill of the Good Hope M. Co., at Phillipshurg has resumed operations. The uumber of men in the mine will be increased.

Jefferson County.

J. Wasson & P. Gruner, lessees of the Independent mine in Cataract district, near Basin, report striking a streak of high grade ore carrying gold, silver and lead. The sboot is 6 inches wide, and assays average $800 in gold and 8 ounces in silver. The Independent adjoins the Mantle mine. Wasson & Gruner have in the past six months sunk a shaft 50 feet, drifted 100 feet on hoth sides, and are stoping oro on the 50-foot level.

Madison County.

The Revenue M. Co., operating at Norris, will build a cyanide plant of capacity of 100 tons daily at its mines and water will be piped to it from a well sunk 2½ miles distant, says Manager Knox. The high grade ores are providing means for developing the mine at present, returns from the last shipment showing 8.9 ounces of gold and 6.1 ounces silver.

Silver Bow County.

Large numhers of miners, who have been thrown out of work hy the shut down of the Amalgamated properties, are leaving Butte and other camps for Colorado, Utah, Idaho and Washington.—— The Supreme Court has put forward on its docket the date for hearing the appealed cases awarded to F. A. Heinze. They will come up for roview this week.

NEVADA.

Elko County.

The Aura King G. M. Co. has been incorporated with principal place of husiness at Ogden, Utah, to operate near Elko. The officers are R. P. Hunter, J. J. Carmichael, O. A. Kennedy, J. R. Hunter and V. Gideon. The company owns the Aura King, Delmonte, Tecumseh and Humholdt claims in Centennial mining district, at Elko, also the Gold Bug placer mining claim.

Esmeralda County.

Tonopah has for more than two years been a center of interest to the entire country. The camp has been systematically studied during the past summer hy J. E. Spurr of the United States Geological Survey, who had already made investigations and studies in Tonopah in the latter part of the season of 1902 and during the succeeding winter. The work of the Geological Survey in this camp is of especial interest on account of the complicated geologic conditious, which render an exposition of the geological principles controlling the occurrence of the ores of great practical economic value. On this account the examination has been drawn to a conclusion as soon as possible, and an attempt has heen made to render the information immediately available to the public. Since the mining public is anxious to ohtain information concerning this district hefore the final report can be published, the director of the survey has authorized Mr. Spurr to issue a preliminary report embodying in a few pages the gist of his conclusions up to the present time and including a copy of the geological map, reproduced in black and white for the sake of quick publication. It is believed that by the use of this map aud the accompanying text great help will be afforded to those who are prospecting and mining in the Tonopah district. This preliminary bulletin, it is expected, will be ready for distribution in a few weeks. The outcropping veins of the region occur in a small rectangular area, bounded on all sides by faults. Within this area the veins lie in a volcanic rock—andesite. After the veins were formed (during a period of volcanic activity) the andesite and the veins were covered by later volcanic flows, among them othor andesites. Theso latter rocks occupy nearly all the district except the small area above noted and another close by. Wherevor the surface exposes them alone the existence or amount of underground wealth can hardly be ascertained without exhaustivo exploration. But there are certain important favorable and unfavorahle circumstances, certain recommondations and discouragements laid down hy Mr. Spurr that may assist in the prosecution of exploration. The later volcanic rocks, including most of the hills of the district, are classed as unfavorable: a certain andesito as favorahle; the vicinity of faults as undesirable, etc. The maps accompanying the report make these recommendations intelligihle and enable property owners and prospective investors to gain some idea of the relative probahilities in different parts of tho field. The position of tho early andesite away from the outcrops can be foretold to only a limited and uncertain extent, for in dealing with a complex of volcanic flows and dikes like that in Tonopah there is no rule which governs their distrihution and hy which their position in an unknown locality can always he defined with certainty. On account of the lack of certainty of results in this work, in many cases it would probahly he more economical, both of time and money, to explore with a diamond drill rather than with shafts.

The Manhattan-Tonopah M. Co., of Now Jersey, under management of H. C. Jones, is preparing to develop its group of five claims adjoining the Pennsylvania-Tonopah on the west and near the Repuhlic-Tonopah mine at Tonopah. Sinking has hegun. A double compartment shaft will go to depth of 1000 feet. A power plant will be in place by the time the shaft is down 50 feet.

Superintendent H. W. Nolson of the Esmeralda Con., near Hawthorne, says work on the mill is under way.

Eureka County.

(Special Correspondence). — Hooper Bros., lessees in the Jackson mines, took out twenty tons of silver-lead ore last week; and ten tons additional were shipped from the Jackson by other lessees.—— Harris Bros., lessees in the Bullwhacker mine, have twenty-three tons of ore at the E. & P. depot for shipment to Salt Lake. The Bullwhacker is on Adams hill, in a quartz-porphyry formation. Development work has opened additional ore bodies.

The Keystone mine, north of Eureka, is reported to have uncovered an ore hody for 400 feet that has average width of 4 feet, carrying 12% copper, twenty-three ounces silver and 15% lead. —— A rich strike is reported in the Retecski mine at Reveille.

The find reported from the northern portion of Eureka county in the foothills of Little Pole creek, from sixteen assays is reported averaging 40% iron with traces of silver and gold.

Eureka, Nov. 3.

Ormsby County.

The owners of the Cowing-Day mine, on the Carson river, near Carson, intend to reopen the mine and will have men at work during the wintor, says tho Carson Appeal.

Washoe County.

A. F. Price of Ninth Crossing says he has men at work on his mine in Rainbow district, near Reno.—— Pritchett & Merklinger have opened a 6-foot ledge showing free gold. —— N. Petersen, R. Nelsen and M. Lund are putting up huildings at their mine. They will use a whim. —— Kolster & Urhan are shipping ore which is reported to net $60 a ton.

Covelite is reported in G. W. Perkins' mine at Dogskin, near Reno, carrying 50% copper.

White Pine County.

Manager P. C. Weber of the Sapho M. Co. at Ely reports striking a shoot of black oxide of copper, showing values in gold as well as copper. Shaft sinking continues.

NEW MEXICO.

Grant County.

A mill is heing built by the National G. & S. M. Co. at Steins Pass. The mill is a concentrator, and the ore will he broken, run through rolls and then over tahles. If this does not recover all of the values a cyanide plant will be added.

The Shamrock M. & M. Co. at Pinos Altos has a new furnace in operation at its smelter, with a capacity of forty tons daily.

There are 300 miners at work in the Burro Mountain mining district, 100 of them doing annual assessment work.

San Miguel County.

G. L. Rhodes reports working a prospect near Ribera, which carries tungsten ore.

H. L. Allen aud F. J. Buck report having found tin in paying quantities near Las Vegas.

Sierra County.

Tho pumping station of the Hillsboro G. M. & M. Co. at Hillsboro has started up.

H. R. Taylor of Cincinnati, Ohio, general superintendent of the South Percha G. M. & M. Co., near Hillshoro, says the work of building the mill is under way.

The Philipsburg mill at Fairview is in operation.

Socorro County.

The Graphic mine at Magdalena last week shipped a carload of ore that ran 15% in copper, says tho New Mexican. Since April 1, 1903, tbis mine has shipped 3000 tons of zinc carhonate ore. The Graphic was formerly a lead producer.

J. Dohbin has his mill at Water canyon, near Magdalena, in operation.——A strike of gold and silver ore is reported made on Socorro mountain.

Taos County.

Concentrates are being shipped to tho smelter from the Jayhawk mill at Red River.

OREGON.

Baker County.

At tho Western Union mine, on Rock creek, near Sumpter, operations will be resumed. The crosscut on north side of the stream cut the vein at 150 feet, and the drift will be extended, says Manager Hillicker.

H. B. Wolking and J. Meadows are developing their White Point group of claims, 19 miles south of Baker City. The group consists of four claims. Tho crosscut tunnel is continued 300 feet farther, and will cut the vein at depth of 200 feet below surface.

O. C. Wright, president and general manager of the Blue BirdM. Co., operating near Sumpter, says work is progressing on the 100-ton concentrating plant. The concrete foundations have been completed and the framing for the buildings is under way.

Clackamas County.

The Ogle Mountain M. Co., with headquarters in Oregon City, has been incorporated hy P. A. and J. B. Fairclough, F. D. Kepkey, and J. V. Harless. The company will operate on Ogle Mountain, near Molalla. They propose to build a stamp mill and to get out ore during the coming winter. There is already considerable ore on the dumps. The quartz is free milling.

Douglas County.

At Golden Slipper group, near Bohemia, President W. W. Ogleshy reports work progressing. The group consists of nine full claims on east side of Grouse mountain, running down to and across Horse Heaven creek. The main tunnel on the Sampson claim is in on the ledge 150 feet, showing a body of concentrating ore. Tunnel No. 2, at 100 feet lower, is in 80 feet on the vein. At upper end of this claim a shaft has heen sunk 12 feet on the ledge, which is 4½ feet wide, and shows a hody of ore, carrying percentage of copper. The Dewey tunnel, at the lower end of the group, is in 200 feet on a parallel ledge. The group is well timhered and watered and has a mill site.

At the Levens Ledge mine, at Riddles, 2000 feet of tunneling has heen done, which shows ledges of gold-bearing quartz, 8 to 12 feet wide. T. T. Burkhart, of Portland, part owner, says they propose to build a 10-stamp mill. The company is composed mainly of Portland men.

Grant County.

Prospecting with the churn drill that has been in progress on Crane Flat, near Granite, for two months was completed last week. Several prospect shafts have also heen sunk to hedrock. This work has been done as preliminary to putting in a dredger for working the gravel, says Superintendent Burch. Bedrock was found to be soft, and tho gravel contained few large boulders.

Josephine County.

C. J. Howard has men at work extending the survey of the Gold Hill highline ditch. Under the old survey the ditch was 80 miles in length, but the new survey will nearly douhlo it. It was formerly intonded to carry the water of the ditch across Elk and Trail creeks by a pipe line. It has been decided this would not be practical, and instead the ditch will be carried around the head of the two streams mentioned. At the head of Elk and Trail creeks thoro are bodies of pine and fir timber, and the ditch will make this availahle for milling and lumbering purposes. The water will also be used by the mines around Gold Hill.

The American G. Fields Co., of Chi-

cago, Ill., which owns the Granite Hill mines on Louse creek, near Grant's Pass, has added to its holdings the Ida aud Golden Terry mines, which claims adjoin the Granite Hill. This gives the company 1000 acres of mineral lands on Louse creek. The Ida and Golden Terry mines will he developed in connection with the Granite Hill properties. The Ida is equipped with a small mill. Both mines aro at a highor altitude than the Granite Hill, and the ore will be conveyed by a gravity tramway.

J. F. Wickham, J. H. Fisk, P. S. Bates and J. H. Wehcr of Portland, owners of the Almeda minc, near Grant's Pass, propose building a 100-ton reduction plant. The Almeda mine contains a body of ore carrying copper, gold and silver. Power will he supplied hy utilizing water of the Rogue river. Mon are at work blocking out ore.

SOUTH DAKOTA.

Lawrence County.

The Tinton M. Co., developing tin mines at Tinton, has completed the tramway from mino to mill; the track is laid and machinery is being set up. Rolls will do the crushiug in tho mill. Several smaller buildings are also going up.

The Anaconda G. M. Co. is preparing to resume work on its group on Elk creek, 8 miles southeast of Deadwood. This is near the Clover Leaf mine.

The Hidden Fortune mill, near Deadwood, has been completed and accepted and is ready for operation. A new strike is reported in ono of tho company's mines near Central City.

The Ruhy G. M. Co. at Galena is building a mill, which will be running by Jan. 1. The plant will have Chilean mills for fine crushing. The process will be amalgamating, followed by tailings treatment. The Ruby Co. has made tests on its ores which show that Chilean mills are adapted to this class of ore. The Ruby Co. has opened up a large body of free milling ore near Galena and can supply 100 or more tons a day. J. Conzette is manager.

UTAH.

Beaver County.

The smelter of the Majestic C. Co. at Milford was blown in Oct. 31st.

Iron County.

Superintendent T. P. Rigney of the Summit Placer Co., which is oporating the ozokerite mines at Soldier Summit, reports development work being increased. The location of the permanent mining shaft is not yet determined.

Juab County.

The Black Jack M. Co. has been incorporated under Wyoming laws to operate tho South Mammoth, West Mammoth, Black Jack, Trail and Phœnix claims near Eureka. The incorporators are J. Knight, D. and J. Evans, R. E. Allen and L. Holbrook. The principal placo of business is Evanston, Wyo.

The underground fire that caused the Centennial-Eureka, Eureka Hill, Bullion Beck and Gemini mines at Eureka to close down, has been located and extinguished by Superintendent Earls of the Bullion-Beck in the Gom stope in the Eureka Hill mine. To reach this stope they were compelled to use scaling ladders, and to cross a narrow ledge through dense smoke and gas. Water is being piped in. The Centennial-Eureka mine is in full operation.

The Manhattan ground, north of the Bullion-Beck mine, is heing worked by a tunnel to crosscut the iron ledge opened up on the surface last month.

The shaft, with which the east ledge on La Reine mine of Tintic, near Eureka, was opened up to depth of 80 feet, has been retimbered and will he sunk to 600 foot, where prospecting of the vein will begin, says Superintendent Driscoll.

Salt Lake County.

Superintendent Janney, of the Utah C. Co. at Bingham reports work progressing on the 500-ton concentrator being huilt. It is expected to be ready for operation Jan. 1.

The Clyde M. Co. has boen incorporated at Salt Lake City, Utah, by G. and E. C. Tucker, J. B. Burbridge, B. D. Siegfus and J. P. Park. The property of the company consists of the Clyde Nos. 1, 2, 3 and 4 mining claims in Big Cottonwood mining district, near Alta.

The properties of the Toledo & Utah Co. at Alta have been sold to A. H. Boyd, J. A. Campion et al. of Leadvillo, Colo. The group consists of the Fuller, Relief and Michigan mines. Dovelopment work will begin this month.

Summit County.

At the Alice mine, in Woodside canyon, noar Park City, they arc proparing to increase devclopment. A blower was placed last week near tho mouth of the tunnel and operated by water power. Heretofore the blower was worked by hand. An air compressor and machine drills will be put in later. The tunnel and incline are in 225 feet, the ore being hauled to the dump by a whim. P. McPhereson is manager of the company.

The payrolls of Park City's mines show an increase of 25% during the last few months, says the Tribune. At the Silver King and at the Daly-West the output has heen increased. The plant at the Daly-Judge has heen enlarged. The Kearns-Keith mines have been equipped with a concentrator. The total numher of men is given at 2000.

Tooele County.

Preparations are being made to reopen the Buckhorn mine near Ophir, which is under hond and lease to the Western Exploration Co. of Salt Lake City.

A. Murphy has an option on holdings of the Daisy M. Co., consisting of a group of gold-hearing locations and a cyanide plant at West Dip, near Mercur. Murphy will reopen and retimber the workings. The gold ores formerly taken out average $3.40 per ton.

Manager G. H. Dern of the Con. Mercur mines, at Mercur, reports the slimes plant at their mill in successful operation. The tailings have heen reduced to an average of 42 cents per ton, as against $1.22, the average for the last fiscal year. The mill is handling 1000 tons of ore per day.

Washington County.

Tho capacity of the copper smelter of the Dixie group of mines near St. George will be increased hy addition of a second furnace. This will afford it a capacity of 100 tons daily, says Manager Doolittle. In addition to doubling the capacity of the smeltor, the company will build a road to the loading station on the line of the San Pedro Railroad.

WASHINGTON.

Ferry County.

(Special Correspondence.)—The output of Republic district was partially restricted last month due to inability of smelters to handle as large a quantity as usual, but it is thought this will be only temporary. Last week the Quilp sent out its usual quota of seventy tons daily. Explorations show the ledge to be 30 feet in width, containing a shoot 2 feet in width assaying $100 per ton in gold and silver. This seam has heen proven for 100 feet in depth, and has beon drifted on for 100 feet. The policy of the management is to keep development so that there will be a year or two's supply in sight.——The Mountain Lion mine has reduced its shipments to 100 tons daily, but work is going ahead underground. The Knob Hill continues turning out soveral cars of ore per week.

Last week the lower tunnel in the Belcher mine reached the ore body which was first cut in the tunnel above, at which point it was 80 feet in width. It shows that this ore hody is at least 250 feet in length. The ores of Republic camp are not self-fluxing, and it is claimed the Belcher mine carries the ores which are essential as flux in the treatment of other ores of the Republic mines. The Belcher ore carries an excess of iron and runs high in sulphur. While the ore is hard it breaks easily and can be mined at minimum cost as soon as machine drills are used. The manager says a gasoline engine and blower are heing set up to be used in ventilating the mine. An air compressor will also be put in.——A smelter is needed in the camp. Rail transportation is convenient and cheap; fuel, timber and water are also ahundant.

The Bodie M. Co., at Bodie, reports development work progressing. The mine is opened by four tunnels to a depth of 450 feet. These are connected with raises and winzes giving ventilation throughout. The vein is 5 feet in width at the surface. At the lowest level it is 20 feet in width. The ore is gold-silver, carrying an average of two ounces of the latter to one of the former. A 50-ton combination mill is in course of erection. Machinery is on the ground.——The Zala M. mine at Sheridan is preparing to begin production. The ore has values principally in silver. It ships sixty tons per week. The output is restricted on account of the condition of tho wagon road from the mine to the railroad.

Republic, Nov. 1.

It is proposed to add a cyanide plant to the mill of the Mountain Lion mine at Republic.

Liucoln County.

Sinco the advance in silver there is renewed activity in Cedar canyon minos, near Davenport, says the Spokesman-Review. The Turk M. Co. is shipping ore through Springdale, which nets $70 a ton. At depth of 450 feet they are drifting on an ore hody 6½ feet wide. The values are in gold, copper and silver. The company will put in an amalgamation plant to cost $75,000. —— J. Young has leased the Door Trail mine from the Deer Trail Co. and he is shipping ore. The company gets as royalty 20% of the ore laid down at the smelter. —— The Silver Seal, the Silver Queen and the Providence are shipping. The Seal is owned hy Van Horn Bros. of Deer Trail. The Queen is owned hy the Queen M. Co. and the Providence is owned hy C. C. May, F. H. Luce and A. W. Turner of Davenport.—— The Legal Tender is making regular shipments. It is owned hy the Deer Trail Co. and Yarwood Bros., and is working under a lease by Huffaker & Yarwood on a 20% royalty.——Tipton & Shifler of Spokano, who own the Evergreen, which joins the Turk, are sinking on the ledge and are working at 70 feet depth. They report having a 4-foot vein.

Okanogan County.

A. E. Williams and J. B. Metcalfe, of Seattle, have bought the Pinnacle gold mine, near Loomis, and will increase development work.

Stevens County.

A diamond drill outfit will be put in at the Hill iron properties, near Valley, says W. D. Dickman of Chicago, Ill., consulting engineer. There are twelve men at work and he will increase this to twenty mon when the drill plant arrives. J. H. Davey is superintendent.——W. S. Rodgers of Spokane, who owns iron-bearing ground near the Hill mine, has men at work.

WYOMING.

The reports in regard to the coal miners' strike in Colorado extending to tho Wyoming coal fields are without foundation, says E. S. Emery, manager of the water plant at Rock Springs. "There is not a single union in the coal fields of Wyoming. The Mine Workers' have had four or five men in the State for the past three months and they have not succeeded in forming one union. There are so many different nationalities working in the coal mines of Wyoming that the labor leaders have so far failed to do anything toward organizing the men. Rock Springs has a population of 6000 and 2000 of these work in the coal mines."

Albany County.

S. A. Walker of St. Louis, Mo., manager of the Acmo Cement & Plaster Co., which has a plant at Laramie, says the company will huild a mill for the manufacture of plaster of paris.

Bighorn County.

The Wyoming Coal & Fuel Co. has been organized to develop a tract of coal land near Garland, hy J. Bird, F. McGregor, H. Hickock, J. Gettier, C. A. Sharver and D. McCullough. The company has started sinking a shaft. Air shafts and other improvements will be made.

Carbon County.

The Ferris-Haggerty mine of the North American C. Co. at Rudefeha is developed to the depth of 700 feet on the vein. The ore carries average values of 0.06 ounce gold, 1.0 ounce silver per ton and 6% copper.

The companies operating the Cascade, High Five and Pasadena mines near Riverside have been consolidated, and will increase operations.

Laramie County.

W. Sturgis of Cheyenne, who has been prospecting for coal near La Grange, reports two veins of coal have been located. The first vein is 200 feet helow the surface, and the second was found at depth of 500 feet. Each stratum is between 3 and 4 feet in thickness. The character of the coal is said to be similar to that mined in Sheridan county. Both oil and gas were also encountered by the diamond drill used in making the investigation.

FOREIGN.

AFRICA.

Natal.

The Natal Navigation Collieries & Estate Co. reports output for month of September at 15,003 tons of coal.

Orange River Colony.

The Koffyfontein mines report 2075 carats diamonds recovered during September.

Rhodesia.

The Ponhalonga Proprietary Co., near Bulawayo, reports the new 40-stamp mill in operation, and during September ran twenty-five days, milling 5000 tons of ore, which yielded over the plates 1400 ounces of gold, value £3700. Sixty-five tons of concentrates were recovered, with value (deducting shipping and treatment charges) estimated at £1365. Working costs, £2600, equal to 10s 4.80d per ton.

Transvaal.

The British South African Export Gazette reports the discovery of tin-hearing ground on the eastern border of the Transvaal, on the edge of the high South African plateau. It is stated the underlying formation of the district is granitic. In places over this granite are the uplifted remnants of schistose rocks. Tin-hearing veins are found at the contact of these schists with the granite. Three lodes have been located. A sample taken from one of them yielded 3.5% of tin. The tin oxide yielded 67% tin. The Transvaal Government's railway department is surveying the property with view to connecting it with a railway. The section would thus he within easy reach of Delagoa hay, whence the ore could he shipped to England at nominal cost.

The Great Eastern collieries, near Drakenshurg, reports output for month of Septemher at 13,300 tons of coal.

The West Rand Central G. Co., near Johanneshurg, for month of Septemher reports owing to continued scarcity of native labor, the manager found it impossible to keep the mills running full time. The directors have decided to temporarily suspend crushing, and with the available labor confine operations to development work.

The Transvaal Chamber of Mines, at Johannesburg, under date of Oct. 10, reports:

Natives distributed to mines during August by Native Labor Association	6,321
Time expired and other wastage	6,083
Net gain during July	238
Total number employed end of July	68,466

The cablegram calls attention to the fact that an allotment of 1788 natives has been made to the railways; otherwise there would be a net gain in tho quantity for September of 2026.——The Board of the Nyassa Co. has approved the contract with the Witwatersrand Native Labor Association for engagement of natives within the limits of its territories for the purpose of temporary immigration to the Transvaal mines. The arrangements, which have received the approval of the Government in Lisbon, provide for recruiting of natives for a period of two years and for their repatriation after oxpiration of contract.

At Johannesburg, on Oct. 13, the miners of the City & Suburban G. M. & Estatos Co. passed an unanimous vote in favor of the importation of unskilled Chineso labor. A meeting of tho South Randfontein G. M. Co. also carried a resolution in favor of such importation.

West Africa.

The Wassau mine in Wassau district, Gold Coast, reports starting crushing on the ore October 12th, with ten stamps running. Work is progressing on the cyanide plant and it is expected to be in working order by the time regular crushing with tho full mill begins. Manager Feldtmann reports that the reef which had been lost in No. 5 level north has been rolocated in the crosscut east, and assays threo ounces for a width of 28 inches.

AUSTRALIA.

New South Wales.

Tho British Broken Hill Proprietary reports mill returns for twenty-one shifts to Sept. 29, 3958 tons oro crushed, producing 735 tons concentrates, containing 426 tons lead and 20,580 ounces silver.

Tho Malacca diamond mines at Copeton during tho last week of Septembor washed 126 loads, producing 182 carats of diamonds and 3625 pounds of tin.

Queensland.

The Lancelot Freehold T. & C. Co., at Newellton, reports having produced during Septemher, twenty-eight tons dressed 65% tin-bismuth ore, and had also on hand October 10th four tons second-class ore assaying 45% metallic tin and bismuth; shipped forty-three tons dressed Lancelot ore.

Victoria.

The annual report of the Secretary for Mines and Water Supply for the year 1902 shows a decrease in the yield of gold of 11,824 ounces as compared with that of the previous year. Up to the end of November the aggregate output was ahead of that for the corresponding period of 1901, but there was a falling off in the December returns of 12,006 ounces. Increases for the year were reported from Ballarat, Maryborough, Maldon, Creswick, and Clunes, Omco, Walhalla, Castlemaine, St. Arnaud, Beaufort and Sterling fields. Ballarat showed tho largest increase and Bendigo the largost decrease. Bendigo's total yield was 184,959 ounces (a decreaso of 20,837 ounces), being 17,565 ounces in oxcess of that from Ballarat. The drop at Bendigo was due to decreases at the Goldon Gully, Great Southern Garden Gully, Ironbark and Golden Pyke mines. Among individual mines the Star of the East at Ballarat yielded 15,932 ounces; Long Tunnel Extended, at Walhalla, 18,675 ounces; Duke United and North Duke, Maryborough, 9304 ounces and 8087 ounces, respectivoly; and the Cassilis Omoo, 8926 ounces. The value of the gold won for tho year was £3,062,028, which brought the aggregato since tho opening of the diggings up to £263,551,229 from a total yield of 65,913,912 ounces. The total quantity of material

treated for the year by dredge mining and hydraulic sluicing by gravitation was 6,911,697, as against 5,937,966 cubic yards for 1901. The gold obtained showed increase of 2235 ounces, being 33,109 ounces for the year. The average yield of gold per cubic yard of material treated was 2.19 grains, as against 2.32 grains for the previous year. In all, thirty-seven dredge mining plants were in operation, comprising ten bucket dredges, nineteen pump hydraulic sluices, two jet elevators and six gravitation sluicing plants. The capital invested in plants, machinery, otc., was estimated at £270,000. The sum of £183,400 was paid in wages. On an average 973 men were engaged in working the plants, in addition to wood cutters, carters and others. Coal mining showed an increased output for the year, although strikes on account of wage disputes interrupted operations to a considerable extent. The quantity obtained was 225,164 tons, as compared with 209,329 tons for 1901. The output of minerals other than gold and coal exceeded that of previous year by value of £13,813. Ten tons of tin oro were wen at Beechwerth in connection with gold dredging operations: 400 tons of infuserial earth wore raised at Talbot; at Lake Boga, Boort, and other places in the Mallee, 3227 tons of gypsum were obtained, while the 47,603 ounces of silver shewn in the returns were extracted from the gold at the mint. By treatment with cyanide, 43,302 ounces 15 pennyweights of gold were extracted from 504,212 tons of tailings, value of the gold, £148,399. Tho Government batteries are distributed between Meonambel, Creswick, Dargo, Waugarra, Omeo, Walhalla, Clunes, Woolshed Flat, Rutherglen, Beaufort, Stawell, Talhot, Enfield, Campbelltown and Aveca. The receipts in the shape of revonuo amounted to £697, and the expenditure to £2496, showing a loss of £1799 for the year.

BRITISH COLUMBIA.

Boundary District.

Ore is being rawhided from the Roderick Dhu mine to the Leng Lake wagon road, near Leng Lake Camp.

The Providence mine, near Greenwood, for tho year onding Sopt. 30, 1903, reports:

Tons of ore mined	543 3
Net value	$54,315 24
Cost of mining and incidentals	23,122 40
Net profits	$31,192 84

M. F. Madden of Chicago, Ill., is president and D. F. McIntosh vice-president and manager.

Superintendent Williams of the Granby mines at Phœnix has started driving tunnel No. 4 to striko the main ore body at depth in the Old Ironsides mine. This tunnol has its mouth at tho foot of Church street, in tho center of the city, and when completed will give four main tunnels by which the Knob Hill and the Old Ironsides mines can be tapped, doing away with hoisting. This tunnol will havo to be driven a distance of 1200 feet under the business part of the city.

At the Granby mines at Phœnix two more steam shovels will be put in oporation in its ore quarries at the Knob Hill. Later it is expected to use one of the machines underground in the stopes. The present shovel has a dipper capacity of three-quarters of a cubic yard, while one of the new ones will have capacity of a cuhic yard, equal to 1500 tons per day.

Nelson District.

The Star M. & M. Co. of Philadelphia, Pa., operating the Star group, 1 mile above the Granite mine, near Nelson, has loased the Poorman-Granite stamp mill and tram for five years. The Star Co. will counect its mino by tram with the Granite tramway. The ore is quartz carrying free gold.

The right of way for tho Hunter V. tramway, near Ymir, has been cleared.

——The flume at the Ymir mine has been completed. It runs from the mill to the cyanido works and carries tho tailings for treatment. The flume is half a mile in length.

Work has hoen resumed at the Alice mine, near Creston, by Hampson & Mayhew, lessees, with fifteen men. It has been idlo two years. Shipments of galena will he made to the smolter.

Rossland District.

The Kootenay mino, at Rossland, is shipping regularly, the ore being drawn from the fourth, fifth and intermediate levels. Development is under way on the sixth level.

Le Roi Two oil concentrator at Rossland is in operation with satisfactory results.——At Le Roi mine stoping continues in the upper levels and development is heing increased in the deep workings. On the 1350-foot lovel the south crosscut is heing driven to tap tho ore body opened up in diamond drilling.

Slocan District.

The Minnesota Silver Co., owning the Ivanhoe mine, near Sandon, will increase the output to 500 tons of asserted ore and concentrates per month. The Ivanhoe is ownod by W. H. and W. C. Yawkey of Detroit, Mich., J. D. Farroll of Seattle, Wash., and P. J. Hickey of Minneapolis, Minn., who is manager. It has been under development for five years and is opened to the 1100-foet level. For two years it has been paying expenses on ore taken out in development. The mill was recently altered to save the zinc more carefully and a 47% product is being shipped to Iola, Kans.

Vancouver Island.

The North Western S. & R. Co. smelter at Crofton, in Victoria mining division, is treating 450 tons of ere per day. From tho Lenora mino 150 tons daily are being received. This is increased by a regular supply from Texada Island and thirty tons a day from Prince of Wales Island.

West Kootenay District.

The 10-stamp mill of the Oyster-Criterion mine, owned by the Great Northern Mines, Ltd., at Camborne, in Lardeau, is in operation. The 3500-foot aerial tramway, which delivers tho oro from a peint 140 feet below the main tunnel and 1800 feot abovo the level of tho mill, is also eperating, and the oro bunker of the mill is filled. There are several hundred tons of ore on the dumps at the mine and 1900 feet of development werk has been done. The mill is provided with three Frue vanners. Tho ore is handled automatically from the time it starts threugh tho rock breaker until it emerges into the dump for the tailings. In the mill is the air compressor, which is operated by wator power. Four machine drills will be put to work stoping ore. J. Lade is superintendont of the mine and mill.

The mill of the Eva mine, near tho Oyster-Criterion mine, at Camborne, which also has ten stamps, is in steady operation. Tho Eva mill has four Frue vanners. It is crushing thirty tons per day.——Work on the McMinnville greup, which adjoins the Eva and Kingston in the Camhorno camp, is progressing under direction ef E. Wright of McMinnville, Or. The werk consists of a tunnel being drivon on the main vein, which is 14 feet wide. The ore is free-milling, gold-bearing quartz, running $10 per ton. A stamp mill will be built.——Tho Kingston group, which adjoins tho McMinnville, will resume, says Manager Blochherger.

CANADA.

According to a report issued by the Dominion Governmont at Ottawa, there was imported into Canada from the United States during 1902 ore crushing machinery to the value of $48,500, steam engines and hoilers to tho value of $347,024.

Alberta.

The Blairmoro Coal & Coko Co. has taken over the Fishburn-Proctor coal mine, extending 4 miles along the railway and comprising 6000 acres near Blairmore. There aro soven workable seams of coal from 3 to 30 feet wide, says President E. H. Fishburn. C. Morris is mine superintendeut.

Ontario.

It is reported that C. M. Schwab et al. of New York have hought the properties of the Bruce C. Co., Ltd., at Bruce Mines, on Georgian Bay, near Algoma, 60 milos from the Canadian Soo.

Quebec.

The copper mines at Eustis and Capelton, 8 miles south of Sherhrooke, on the Boston & Maine Railroad, give employment to 200 men, writes P. Lang, U. S. Consul at Sherbrooke. The company formed last year to huild a smelter at Sherhrooke has heen unahle to raise necessary funds for the plant. It is thought that a smelter at this place would cause the opening up of additioual copper properties, as well as renewing work on old ones, which were abandoned because of lack of smelting facilities at reasonahle prices. The ashestos mines at Thetford and Black Lake, on the Quebec Central Railway, have had a profitable year. Their shipments to the United States were valued at $647,067, as compared with $610,741 in 1902.

GERMANY.

United States Consul General O. J. Hughes, at Coburg, writes that the pumping system formerly employed at the Kaiserstuhl II mine at Dortmund was sufficient to raise 4 cubic meters (141 cubic feet) of water per minuto to a height of 300 meters (975 feet). The present condition of the mine necessitates raising 8 cubic meters (282 cubic feet) per minute and an electrical pumping system has heen adopted. The pump is triple-acting and at 75 revolutions per minute can raise 5 cubic meters (176 cubic feet) of water to a height of 400 meters (1300 feet). It is driven directly by a three-phase induction motor, rated at 570 H. P. The motor, which has a diameter of 10 feet, has star-connected windings, the outer terminals being carried to slip rings. A rheostat is provided for starting the motor. The stator is made in two parts and is supported upon two six-arm spiders from main bearings. The motor operates at 1900 volts and 22½ cycles per second, and when running without load absorbs 62 amperes (corresponding to 16 kilowatts). At normal load 170 amperes are required. The power factor is 82%, the efficiency 92%, and the slip 2.7%. Tho generating station contains two alternators, one of 840 and one of 140 H. P., both three phase. The exciting current is furnished by an independent dynamo driven by a separate engine. The two machines may be worked in parallel, and the station includes a high-voltage switchboard. The meter is located in a chamber in the mine.

MEXICO.

Chihuahua.

Negotiations for sale of the Dolores mine in northorn Chihuahua, near the line of the Sierra Madre & Pacific Railroad, have heen closed, and the Venture Corporatien of Londen, England, has made first payment. Tho mino was owned principally by San Francisco, Cal., mon.

E. T. Le Claire et al. of Milwaukee, Wis., have closed a deal for the Sufrigio, Brava, La Luz and New York mines, near Urique, which are extensions of tho Lluvia de Oro mine. The deal was for $200,000 in gold. At tho Lluvia de Ore mine, noar Urique, thero is a mill of six stamps, but twenty stamps will he added.

J. Long of Parral, manager of the Hidalgo M. Co., says the Loiter optien on the Hidalgo M. Co. mines has been extended to Novemher 20th. The mills of the company are expected to be in operation hy January 1st. J. M. Botello, manager, will start up tho Parral M. Co. mill by January 1st.

E. S. Burke Jr. of Cleveland, Ohio, has put mon to work on tho Concheno mines, near Minaca.

Durango.

The American M. Co. of Chicago, Ill., will build a load-silver smelting plant at the mines at Velardena. The plant will have capacity of 300 tons. The company will put in machinory and drills for use at Reyes.

Guanajuato.

J. B. Macmanus et al. of Guanajuato report having organized a company to concentrate the sands and slimes of the Guanajuato river.

The La Luz M. Co. of Colorado Springs, Colo., will put in an oloctric hoisting plant on its property at Guanajuato. Tho equipment will consist of a hoist capahle of lifting two cagos from depth of 2000 feet and the necessary accessories and machinery. Power to operate the plant will bo furnished hy the Guanajuato P. & E. Co. The La Luz Co. is increasing development work.

Mexico.

At Chalchiltepec, district of Temescaltepec, 50 miles southwest of San Juan de las Huertas railroad station, near Toluca, J. F. O'Brien has organized a company to exploit a group of mines. Mason & Mason have hought the Santa Rosalia mino and H. Millor, of El Oro, is superintendont. Operations will hegin next week.

Sonora.

T. W. Foster, manager of the Missouri-Mexican M. Co. of Kansas City, Mo., which has a group of antigua properties at Campo Todos Santos, 9 miles southeast from Suaqui do Batuc, and south of the Yaqui river, says development work is progressing. The Missouri-Mexican M. Co. has 148 pretenencias, showing several ledges, yielding pay ore. The oros are copper, carrying values in gold and silver. One of the veins yields lead carhonates. The company is composed of Eastern men, and they will put in a plant of machinery for complete development of the group. G. E. Whittich of Larned, Kan., is president.

Work is progressing on the reduction plant for the Ruhy G. &. C. Co., at Batamote, east from Ortiz station.

The concentrator at Salero, in Tyndall district, Santa Rita mountains, 15 miles northwest from Patagonia, is in operation and concentrates are heing shipped. The plant is owned hy the Arizona G. & C. Co.

F. Morgan has resumed operations at the antigua mine, La Mexicana, 4 miles east of Cananea, says the Oasis. The mine is owned hy Sacramento, Cal., men, operating as L. L. Louis & Co. A shaft is being sunk, and is down 200 feet, cutting into the old workings. Shipments of silver ores will he resumed.

NEW ZEALAND.

The Waihi Grand Junction G. Co., near Waihi, reports on the 500-foot level, in northeasterly direction, 219 feet from No. 2 shaft; the width of No. 2 lode has been shown 4 feet, with assay values of $29.75 in gold.

The New Zealand Government at Wellington has introduced in Parliament a Public Works bill providing for a loan of £1,000,000, three-fifths to be devoted to railways and the remainder to land settlement and gold mines.

NICARAGUA.

A. L. Gottschalk, United States Consul at San Juan del Norte, says there are seven "mineral regions" or groups of mines in course of development in eastern Nicaragua. The regions are locally known as follows: Pispis, Tunki, Siuna, Ceco (or Wanks), Cuicuinita, Rio Grande and La Grupera (or "El Mico" region). The labor employed in the mines of this part of the country is of four classes: 1. Mosquito and other Indians for making trails, felling timber, and machete werk in general. 2. English-speaking coast negrees, or half-breeds ("coast creoles"), for work under ground. 3. Nicaraguans from the interior, for same purpose. 4. Foreigners (whites), as section bosses, commissaries, for timbering, and fer ether skilled labor. These four classes of labor are all paid in Central American silver (1 pese or "sol" being equal to 38.4 cents in United States currency), and laborers earn respectively by the day, by classes 1, 2, 3 and 4. 38.4c, 57.6c, 57.6c and $1.92 to $2.69 and food, which must always be furnished them by the mine. One mine owner, who employs a large number of Mesquito Indians, says he has computed the expense of feeding his men, in gangs of twonty-five, at 19.2c per diem.——Tho pay of laborers as quoted abevo differs materially from the wages usually given in the interier (mines of Chentales, Segovia, and ether departments); as in the interier laborers are "matriculated"—that is, are engaged for a term of months undor a "peonage" system, tho local military autherities enforcing fulfillment of contract with their employer whenever necessary. It is nsual to pay them an "advance" on engaging them (usually less than one-half the first month's wages).——Water pewer is available, the country boing little more than a network of rivers and their tributaries. The climate, though not unhealthy, is rainy almost throughout the year, aud there is no fear of sudden dreught, causing the rivers to run dry, as in so many ether subtropical regions. The country is thickly wooded, and timber ahounds for purposes of lumbering and fuel.

——In Tunki region, near the Prinzapolka river, the principal mines are the Bonanza, Neptune and the Atlas. The Bonanza mino, J. Lapierre et. al., owners, has six 3½-foot Huntington mills in operation. The Neptune is owned by F. A. Pellas, who has a mill.——On Okumwass river, the Minnesota mine is worked with a 3½-foot Huntington mill and makes output of thirty to fifty ounces geld per month. The owners are H. A. Maypother of Jamaica and H. Patterson.——In Pispis region, up Prinzapolka river, on the Bamhano, the principal mines are the Siempre Viva, Constancia, Concordia, San Antonio, Santo Domingo and Lene Star. Tho last named is owued by Smith, McIuness & Bluett. In ten months preceding July, 1903, they crushed 43,940 tons of ore, yioiding $65,910. Work is done with a 3½-foot sectional Huntingten mill, but they are building a 20-stamp mill.——The Siempre Viva mine for the first five months of 1903 produced $34,169.31 with their 20-stamp mill. Tho Siempre Viva M. Co. has headquarters at Bluefields and S. D. Spellman is president.——Tho principal mines in Siuna region are La Luz y Los Angeles (with two 3½-foot Huntingtons), Buenaventura (owned by J. Pizarro), and the Santa Rita (owned hy I. Osorio).——La Grupera (or El Mica) region is near the Escondido river, ahove towu of Rama. Brown & Harris of Bluefields own a group of 150 claims, as the Topaz M. Co. They have a 20-stamp mill and concentration plant, and are putting in cyanide process.——The work done on upper roaches of the Cocó is principally placer; same applies to Rio Grande, which has been loss thoroughly prospected. La Rosalia and the Hermandad are quartz mines in Cuicuinita district, hoth the property of Chiuese merchants at Bluefields. The district takes its name from the Cuicuinita river, one of the upper branchos of the Prinzapolka.

EXPORTS OF GOLD FROM BLUEFIELDS FROM JANUARY 1, 1900, TO JUNE 30, 1903.

Year—	Quantity—Ounces.	Value.
1900	13,334½	$216,507 25
1901	16,741	259,077 00
1002	22,718½	339,056 80
1903 (first six months)	13,100	192,670 00

PERU.

Frank Klepetko, consulting engineer for the mines at Cerro de Pasco, in Junin department, owned by J. B. Haggin et al. of New York, says they are preparing to put in an extensive smelting plant at their mines.

TASMANIA.

The Tasmania G. M. Co., Ltd., has been organized in London, Eng., to take over the mines and works of the Tasmania G. M. & Quartz Crushing Co., at Beaconsfield, for £266,500. The inflow of water in the lower levels has made it necessary to increase capacity of pumping plant. The mine has been worked from the main shaft to depth of 818 feet. Another shaft has been sunk 1100 feet, cutting the vein at 1000 feet, showing width of 7 feet. The ore shoot has been opened for 1500 feet. The mine is said to be worked out down to the 718-foot level. The ore averages 15 dwts. gold per ton. The mill has 105 stamps and it is proposed to add 40 more. J. Taylor of London, Eng., is manager.

Personal.

E. L. BALLOU has retured from Pony, Mont., to Igo, Cal.

R. S. SLUSHER is in Phœnix, Ariz., examining mining property.

J. S. CONDON of Verdi, Nev., is in San Francisco, Cal., on mining business.

C. K. MCCORNICK has returned to Salt Lake City, Utah, from California and Arizona.

W. H. LINNEY, manager of the Dewey mines at Pearl, Idaho, is examining mines in Arizona.

H. B. WRIGHT is chief engineer for the Crow's Nest Pass Coal & Coke Co., at Fernie, B. C.

J. P. EVANS, manager of the Colorado Iron Works Co., Denver, Colo., is in San Francisco, Cal.

D. B. KEMP, of Telluride, Colo., interested in Colorado mines, is in San Francisco, Cal.

G. E. BAILEY, E. M., of San Francisco, Cal., has gone to Washington, D. C., on mining business.

G. E. ALEXANDER of Denver, Colo., is now metallurgist at the Crown King mine, Crown King, Ariz.

F. SEARLES of Nevada City, Cal., interested in Nevada county, Cal., mines, is in San Francisco, Cal.

T. E. MCSORLEY, of Mokelumne Hill, Cal., interested in Calaveras county mines, is in San Francisco, Cal.

PRESIDENT J. DERN of the Con. Mercur mines returned this week to Salt Lake City, Utah, from Nebraska.

H. B. KAEDING of San Francisco, Cal., has gone to Corralitos, Chihuahua, Mexico, to examine mining properties.

H. R. TAYLOR of Cincinnati, O., is general superintendent of the South Percha G. M. & M. Co. at Hillsboro, N. M.

MANAGER J. DEDERICHS of the Black Diamond mine at Stockton, Tooele county, Utah, is visiting in California.

W. A. BYERS has returned to Salt Lake City, Utah, from Salmon City, Idaho, where he is engaged in mining.

WILLIAM THOMPSON, manager of the Rossland-Kootenay M. Co., of Rossland, B. C., has gone to Mexico on a short business trip.

J. RICHARDSON returned to Salt Lake City, Utah, last week from Montpelier, Idaho, where he is developing mining properties.

L. E. CASSATT, superintendent of the Cassatt-Homestake mine near Idaho Springs, Colo., returned last week from an Eastern trip.

S. C. HAZELTON is assistant superintendent of the United States M. Co.'s plant at Bingham Junction, near Salt Lake City, Utah.

R. H. CAMPBELL has roturned to California from Nome, Alaska, where he has been engaged in extensive hydraulic mining operations.

W. H. CLARY JR., manager of the South Bank mine, near Sheep Ranch, Calaveras county, Cal., is in San Francisco, Cal., on business.

G. W. SMITH of Florence, Colo., is examining mining properties in Chihuahua, Mexico, for the El Colorado M. & M. Co. of Colorado Springs, Colo.

A. F. CRANK of the Blaisdell Co. has sailed for Johannesburg, South Africa, where he will have charge of the company's South African business.

FRANCIS T. FREELAND has resigned the management of the Smuggler mine, Aspen, Colo. S. I. Hallett, the former manager, will resume charge.

B. B. LAWRENCE of New York, with J. H. Roheson of Georgetown, Colo., have returned from a visit to tbe old Whipsaw copper property, near Briggs, Ariz.

F. C. MUELLER, vice-president of the Promontorio G. M. Co., returned to Nogales, Ariz., last week from a several weeks' trip to California on mining business.

W. BAYLEY of Los Angeles, Cal., director in the Tomhoy G. M. Co., Ltd., bas returned from the company's mines at Telluride, San Miguel county, Colo.

A. A. LANE, part owner of the La Bufa M. Co., operating La Bufa mines near Minas Prietas, Sonora, Mexico, returned to the mines last week from a trip to England.

FRANK DAVIS, manager of the Sonora M., M. & D. Co. and the Yaqui S. & R. Co., operating at Toledo, Ures district, Sonora, Mex., is in San Francisco, Cal., on business.

D. S. JOHNSON, formerly with the American S. & R. Co., at Aguascallentes, Mexico, has taken a position with the Pennsylvania M. Co. at Grass Valley, Nevada Co., Cal.

J. CONZETTE, manager of the Ruby G. M. Co. at Galena, S. D., is in Utah examining milling plants, with a view to placing a mill on the Ruby property best adapted to the ore of that mine.

J. L. GIROUX, president and manager of the Giroux Con. C. Co., with A. M. Snedeker et al., have gone to examine mines in Sonora, Mex., after a trip of inspection of their copper mines at Ely, White Pine county, Nev.

T. RAPSON, who developed the Trimountain mine, near Painesdale, Mich., as chief mining captain, is superintendent of the Miskwabik mine, near Allouez, Keweenaw county, Mich., vice Superintendent Scott of the Phœnix mine.

Commercial Paragraphs.

THE Blaisdell Co. reports having 40-foot and 30-foot class A excavators under construction at Erith, England, for shipment to South Africa.

THE San Francisco, Cal., office and supply house of the New York Belting & Packing Co. has been moved from 509 Market St. to 605-607 Mission St., San Francisco, Cal.

THE Lunkenheimer Co., of Cincinnati, O., manufacturers of brass and iron steam specialties and engineering appliances, have opened a branch office at No. 24 Boulevard Voltaire, Paris, France, where they carry a complete stock of their goods.

A. R. PARTRIDGE, Starr King Bldg., San Francisco, Cal., manufacturer of the centrifugal impact pulverizer, reports shipping one machine to the Rustlers M. Co., in El Dorado county, Cal. He also reports having one pulverizer ready for shipment to Lassen county, Cal.

A. E. LINDROOTH, who has been representing the Link Belt Machinery Co. in Denver the past six years, has formed a partnership with his assistant in the Denver office, Benedict Shubart, with offices in the Boston Block, Denver, Colo., and will represent the Link Belt Co., as heretofore, as well as the Goodman Mfg. Co. of Cbicago, Ill., manufacturers of high-grade electrical mining machinery, such as mine haulage systems and traction locomotives, and also the Morgan third-rail system, which they have recently acquired, and now in use throughout the East.

THE Crocker-Wheeler Co., Ampere, N. J., have an order from the Lorain Steel Co., Lorain, O., through the Pittsburg office, for forty-one motors, in size from 2½ H. P. to 360 H. P.; another order from the New Jersey Zinc Co., Hazard, Pa., through the New York office, is for one 125 K. W. and two 600 K. W. generators, and 37 motors, aggregating 401 H. P. The Philadelphia office placed an order from the Warren Foundry & Machine Co., of Phillipsburg, N. J., for one 200 K. W. generator, four 35 H. P. motors and two 60 H. P. motors, and through the Chicago office, the G. H. Hammond Co. bave ordered for its packing plant, at the Union Stock Yards, in that city, one 50 H. P., one 25 H. P. and two 20 H. P. motors, and an 800 K. W. 550 volt, size 896 engine-type generator.

Dividends.

Bunker Hill & Sullivan M. & C. Co., Idaho, $30,000, payable Nov. 5.

Catalogues Received.

Catalogue No. 5 (fourth edition) of the Evans hydraulic elevators and hydraulic mining machinery, published hy the Risdon Iron Works, San Francisco, Cal., gives copious illustrated data on principal machinery points connected with hydraulic mining.

Bulletin No. 5 from the Mine & Smelter Supply Co., Denver, Salt Lake City, El Paso and New York, treats of the new No. 5 Wilfley concentrator recently illustrated and described herein. Tbe treatise gives a good detailed description of the table, tells how to erect and operate it, and illustrates its several parts.

Catalogue No. 37 from tbe F. M. Davis Iron Works Co., makors of mining and milling machinery, Denver, Colo., is devoted entirely to ore milling machinery and treats of everything connected therewith from rock breakers to zinc precipitating boxes. Like other progressive publications of similar character, it is standard size and is a compendium of information on ore milling macbinery.

"Temporary Edition, 33B–1903," is the unpretentious title of a valuable little treatise on air compressors, just issued by the Ingersoll-Sergeant Co., 26 Cortlandt street, New York City, wbich, besides giving illustrated description in detail of some of their machinery, contains several tables and formulæ of interest to any one having anything to do with rock drills or air compressors. The little book is of standard size—6x9—and deserves place in one's working library.

Latest Market Reports.

SAN FRANCISCO, November 6, 1903.

METALS.

SILVER.—Per oz., Troy: London, 27½d (standard ounce, 925 fine); New York, bar silver, 59⅝c, refined (1000 fine): San Francisco, 59⅝c; Mexican dollars, 47½@49c San Francisco, 45½c New York.

During the past two weeks silver has taken a decided slump from about 61 cents to 59⅜ cents. All interested in the silver market had hoped that the price would be maintained above 60 cents. Evidently the withdrawal of the Government from the market is having its effect, which was not at first noticeable. The market will now probably continue weak until the Government is again a large buyer of the metal.

COPPER.—New York: Standard, $14.00; Lake, 1 to 3 casks, $14.00; Electrolytic, 1 to 3 casks, $13.75; Casting, 1 to 3 casks, $13.50; San Francisco: $15.00. Mill copper plates, $17.00; bars, 18@24c. London: £58 10s spot per ton.

Tbe copper market shows signs of strength. Prices are unchanged from those quoted last week, but sales of Lake are reported at somewhat higher figures than those quoted above.

LEAD.—New York, $4.50; Salt Lake City, $3.50; St. Louis, $4.00; San Francisco, $4.50, carload lots; 4¾c 1000 to 4000 lbs.; pipe 6½, sheet 7, bar 5¾c; pig, $4.75. London: £11 5s ₱ long ton.

SPELTER.—New York, $6.00; St. Louis, $5.10; London, £21 2s 6d ₱ ton; San Francisco, ton lots, 6¾c; 100-lb. lots, 7c.

TIN.—New York, pig, $25.75 @ 26.00; San Francisco, ton lots, 27½c; 500 lbs., 28c; 200 lbs., 28c; less, 28½c; bar tin, ₱ lb., 30@32c. London, £118.

PLATINUM. — San Francisco, crude, $18.00 ₱ oz.; New York, ingot, $19.00 ₱ Troy oz. Platinum ware, 75 @ 80c ₱ gram.

QUICKSILVER. — New York, $46.00@47.00, large lots; London, £8 7s 6d; San Francisco, local, $43@44 ₱ flask of 76½ lbs.; Denver, $49.50. Export, $42.50@43.00.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 35c; Eclipse, 37½c.

SOLDER. — Half-and-half, 100-lb. lots, 18.75c; San Francisco, Plumbers', 100-lb. lots, 15.50c.

ZINC.—Metallic, chemically pure, ₱ lb., 50c; dust, ₱ lb., 10c; sulphate, ₱ lb., .04c.

NICKEL.—New York, 50@60c ₱ lb.; ton lots, 40@47c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30@34c.

ANTIMONY. — New York, Cookson's, 7¼c; Hallett's, 6⅝c; San Francisco, 1000-lb. lots, 8c; 300@500-lbs., 8½c; 100-lb. lots, 10½c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, $16.35 @17.10; gray forge, $14.65; San Francisco, bar, 3c ₱ lb., 3½c in small quantities.

STEEL. — Bessemer billets, Pittsburg, $27.00@29.00; open hearth billets, $28.00 @30.00; San Francisco, bar, 7c to 12c ₱ lb.

Dealers forge	12 00@12 50
No. 1 railroad wrought	14 00@14 50
No. 1 cast, net ton	13 00@14 00
Iron rails	17 00@17 50
Car wheels	17 00@18 00
Cast borings	5 25@ 5 50
Turnings	10 00@10 50

LUMBER. — (Retail): Pine, ordinary sizes, $24.00@25.00; extra sizes higher; redwood, $28.00@30.00; lath, 4 feet, $4.50 @5.00; pickets, $21.00; shingles, $2.50 for No. 1 and $2.25 for No. 2; shakes, $13.50 for split and $15.00 for sawed; rustic, $28.00 @35.00.

NAILS.—Per keg (list prices): No. 20d to 60d, Wire, $3.35; Cut, $3.55; 10d to 16d, Wire, $3.45; Cut, $3.35; 8d Wire, $3.50; Cut, $3.50; 6d and 7d, Wire, $3.60; Cut, $3.60; 4 and 5d, Wire, $3.70; Cut, $3.70; 3d, Wire, $3.85; Cut, $3.85; 2d, Wire, $4.10; Cut, $4.10. Special rates for carload lots.

LIME.—Santa Cruz, $2.35; Rocbe Harbor, $2.35 ₱ bbl.

CEMENT.—Imported, $2.50@2.75 ₱ bbl.; California carload lots, $2.25 f. o. b. at works; small lots, $2.50 ₱ bbl. in sacks, 4 sacks to bbl.

GENERAL SUPPLIES.

OILS.—Linseed, boiled, bbl., 49c; cs., 54c; raw, bbl., 47c; cs., 52c; Lucol oil boiled, bbl., 44c; cs., 49c; raw, bbl., 42c; cs., 47c. Kerosene—Pearl, per gal., 22c; Astral, 22c; Star, 22c; Extra Star, 26c; Eocene, 25c; Elaine, 28c; Water White, in bulk, 15½c; Mineral Seal, iron bbls., 19c; wooden bbls., 21½c; cs., 25c; Mineral Sperm, cs., 26½c.; Deodorized Stove Gasoline, bulk, 17c; do., cs., 23½c; 86° Gasoline, bulk, 21c; do., cs., 27½c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 13c; do., in cs., 19½c; Lard Oil, E W. S., bbl., 85c; cs., 90c; Neats-foot Oil, pure, bbl., 75c; cs., 80c; Sperm, crude, 50@60c; Natural White, 70c; Bleached, do., 75c; Wbale Oil, cs., 50@55c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; loss than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2.00 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Triple tape, $3.60 per 1000 feet; double tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11c ₱ set; 14 oz., 40s., 10c.

COAL. — San Francisco, coast, yard prices: Wellington, $8.00; Seattle, $6.50; Coos Bay, $5.50; Southfield, $8.00. Cargo lots, Eastern and foreign: Wallsend, $7.50; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8.00; Cumberland, $13.00; Cannel, $8.50; Welsh Anthracite, $13.00; Rock Springs, $8.50, long ton; Colorado Anthracite, $14.00. Coke, $10.50 per ton in bulk, $13.00 in sacks; Sunnyside, $8.50, long ton.

CHEMICALS. — Cyanide of potassium, 98%–99%, jobbing, 23@24c ₱ lb.; carloads, 23@23½c; in tins, 30c; soda ash, $2.00 ₱ 100 lbs.; hyposulphite of soda, 3@3½c per lb.; caustic soda, in drums, 3@3½c ₱ lb.; Cal. s. soda, hhls., $1.20@1.40 ₱ 100 lbs.; sks., $1.05; chlorate of potash, 12@13c; nitrate of potash, bbls., 10c; caustic potash, 10c in 40-lb. tins; roll sulphur, 2½@2¾c; powdered sulphur, 2@3c; flour sulphur, French, 3¼@3½c; alum, $2.00@2.25; California refined, 1¾@2c; sulphide of iron, 8c ₱ lb.; copper sulphate, 5¼@5¾c; chloride of lime, spot, $2.50@2.75; sulphuric acid, in carboys, 66° B, 1¾@2c ₱ lb.; nitric acid, carboys, 8c ₱ lb.

BONE ASH.—Extra No. 1, 5@6c ₱ lb. No. 1, 4@5c.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 6c; less than 500 lbs., per lb., 7c; in 25-lb. tin pails, ½c ₱ lb. above keg price; in 1 and 5-lb tin cans, 100 lbs. per case, ½c. per lb. above keg price. Dry Lead—In bbls., 1 ton and over, 6c; do. in kegs, 6½c.

RED LEAD.—500 lbs. and over at one purchase, ₱ lb., 6½c; less than 500 lbs., 7c.

LITHARGE.—Pure, in 25-lb. bags, 8@9c ₱ lb.

BORAX.—Concentrated, 6@7c ₱ lb; powdered, 8@10c; fused, 20@25c; crystal, 7c; calcined, 25c.

MANGANESE.—Pure, ₱ lb., 60c.

SODIUM.—Metal, ₱ lb., $1.00.

BISMUTH.—Subnitrate, ₱ lb., $1.75.

MERCURY.—Bichloride, ₱ lb., 90c.

MOLYBDENUM.—$2.00 ₱ lb.

CHROMIUM.—90% and over, ₱ lb., $1.00.

PHOSPHORUS.—American, ₱ lb., 75c.

SILVER.—Chloride, ₱ oz., 90c@$1.00; nitrate, 55c.

ALUMINUM.—No. 1., 99%, small lots, 37c ₱ lb.; 100 lbs., 35c; 1000 lbs, 34c; ton lots and over, 33c, Pittsburg. No. 2, 90%, small lots, 34c; ton lots and over, 31c, Pittsburg.

URANIUM.—Oxide, ₱ lb., $3.50.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise notod.)

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific Coast inventors:

FOR THE WEEK ENDING OCTOBER 27, 1903.

742,576.—FISHING REEL—A. J. Arnold, National City, Cal.
742,385.—MIXER—H. W. Blaisdell, Los Angeles, Cal.
742,389.—PIPE WRENCH—F. D. Bullard, Los Angeles, Cal.
742,397.—NOZZLE—W. S. Day, Spokane, Wash.
742,786.—LUBRICATOR—E. K. Green, Los Angeles, Cal.
742,424.—BAKE OVEN—M. Hennings, S. F.
742,648.—OIL BURNER—A. W. Hess, San Jose, Cal.
742,787.—SASH FASTENER—F. G. High, Los Angeles, Cal.
742,332.—RATCHET CLUTCH—J. H. G. & P. R. Kunny, Los Angeles, Cal.
742,451.—WATER SUPPLY FOR WELL DRILLS—W. H. Ladley, Maricopa, Cal.
742,462.—TRACTION WHEEL—J. W. Livermore, Berkeley, Cal.
742,699.—ROOST—C. H. Mattox, Baker City, Or.
742,717.—CONVEYOR—W. L. McCabe, Seattle, Wash.
742,478.—HAND BAG—W. W. McCormick, S. F.
742,207.—GARMENT HANGER—A. Mieden, Sumpter, Or.
742,471.—PUMP—Morrice & Grim, Sonora, Cal.
742,724.—SHADE FIXTURE—J. Nicholas, Berkeley, Cal.
742,480.—GENERATOR—E. I. Nichols, S. F.
742,800.—HARNESS—J. N. Patten, Colegrove, Cal.
742,726.—BATTERY—J. A. Pedrazzi, Carmel, Cal.
742,235.—TRAMWAY—B. C. Riblet, Spokane, Wasb.
742,236.—TRAMWAY GRIP—B. C. Riblet, Spokane, Wash.
742,509.—HORSESHOE—C. W. Smith, Renton, Wasb.
742,510.—CONCENTRATOR—C. H. Snow, Stockton, Cal.
742,752.—HARROW—N. W. Thompson, Erskineville, Or.
742,529.—WATER MOTOR—Trenchard & Heath, Gannel, Cal.
742,546.—TIME LIMIT TICKET—R. W. Wood, Seattle, Wash.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

WATER SUPPLY DEVICES FOR WELL DRILLING.—No. 742,451. Oct. 27, 1903. Wm. L. Ladley, Maricopa, Cal. One-half assigned to R. L. Peeler of same place. This invention consists of an open-bottomed cylinder provided with a valve by which the bottom may be closed or opened at will; a means for raising and lowering the device within the well, and a means for opening the valve when it reaches the bottom of the well and holding it open until the contents of the apparatus are discharged. The object of the invention is to provide a means for placing the required quantity of water at the bottom of the well and discharging it gently and without motion by simply raising the receptacle after the bottom has been opened to allow the water to flow out.

HAND OR LIKE CONTAINING BAGS.—No. 742,478. Oct. 27, 1903. Wm. W. McCormick, San Francisco, Cal. The object of this invention is to so construct the bag that the ends are substantially of the same width from top to bottom of the bag, and to so connect them with a frame having a radius not greater than the diameter of the bag, that the upper ends may be raised when the bag is opened and folded when the bag is closed in an approximately vertical plane and without projecting into or outwardly from the bottom of the bag.

CONCENTRATORS.—No. 742,510. Oct. 27, 1903. C. H. Snow, Stockton, Cal. The object of this invention is to make a concentrating table that will admit of working pulps of different degrees of fineness simultaneously and independently of each other upon oppositely inclined tables, which are independently adjustable and have a common concussive movement.

PUMPS.—No. 742,471. Oct. 27, 1903. G. Morrice and C. G. Grim, Sonora, Cal. This invention relates to improvements in pumps of the double-acting type, in which a reciprocating plunger is adapted to draw water alternately into valve-controlled passages connecting with the pump barrel above and below the plunger and to discharge the water in a continuous stream. Its object is to provide a pump of this character suitable particularly for deep-mining operations, which shall be simple in construction and which is readily convertible into a single-acting pump, thereby allowing repairs or renewals to be made without suspending the operation of the pump.

HENRY CAREY BAIRD & CO.,
Industrial Publishers, Booksellers and Importers,
810 Walnut St., Philadelphia, Pa., U. S. A.

☞ *Our New and Revised Catalogue of Practical and Scientific Books, 32 pages, 8vo.; a Catalogue of Books on Metallurgy, Mining, Prospecting, Mineralogy, Geology, Assaying, Analysis, etc; a Catalogue of Books on Steam and the Steam Engine, Machinery, etc.; a Catalogue of Books on Sanitary Science, Gas Fitting, Plumbing, etc.; and our other Catalogues and Circulars, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish his address.*

SITUATIONS WANTED.

A COMPETENT MILLMAN OF 10 YEARS' EXperience would like to take charge of a mill in any part of the country, understanding cyaniding thoroughly. Wife would like to take charge of boarding house at same place. Address W. G., care of Mining and Scientific Press.

AN ASSAYER AND CHEMIST WITH TWELVE years' experience in mining, milling, smelting and cyanide work desires a position. Best of references. Address Box 379, Central City, Colo.

CYANIDE CHEMIST WHO HAS SUCCESSfully managed cyanide plants will be open for engagement in November. Ten years' experience in different countries. Reasonable salary. Address "Reliable," care of this office.

FIRST-CLASS STATIONARY ENGINEER; 25 years' experience in mills and mines. Address Frank Wagner, Brooklyn Hotel, San Francisco.

MINING ENGINEER OF GOOD STANDING, with twelve years' experience in mines and mills, wants position as expert. School of Mines graduate. Address V. X., this office.

PRACTICAL EXPERIENCE IN METAL MINing, installing and operating steam boilers, engines and mining machinery, together with a thorough course in mining engineering at the Scranton schools, enables me to be thoroughly competent to take hold of a new property and develop it by the latest scientific mode of mining to a paying basis. Can furnish A1 reference. Open for engagement after January 1st, 1904. THEO. T. SWIFT, Muskegon, Mich. Lock Box 113.

SUPERINTENDENT WANTS POSITION WITH substantial company. Practical miner, millman, assayer and cyanide expert. Address Supt., this office.

WANTED BY AN EXPERIENCED MINING Engineer and Manager, a position as mine manager in gold, silver or copper proposition, with a first-class corporation. Have had 35 years' experience in U. S. and Mexico; prefer Mexico. Speak Spanish, German, French and English. Am well acquainted with Mexico, and am employed now. Desire a change between November and January 1st, 1904. Salary expected not less than $5000 per annum. Can furnish the best of reference. Address "Mine Manager," care of Mining and Scientific Press, San Francisco, Cal.

WISH POSITION AS SUPERINTENDENT OF a mine, assayer, millman, steam engineer, or tool sharpener. Fifteen years' experience. Have good assay outfit. Address J. L. WETMORE, Rich Gulch, Calaveras Co., Cal.

WANTED—POSITION BY AN EXPERIENCED Analytical Chemist, Assayer and Millman. References furnished. Address H. T. S., this office.

YOUNG GRADUATE OF A GOOD MINING school desires position in a mine where there will be chance for advancement. Good assayer, chemist, surveyor, and draughtsman. Address G. R., care of Mining and Scientific Press.

ASSESSMENT NOTICES.

GOLDEN WEST MINING AND MILLING Company.—Location of general place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 11th day of September, 1903, an assessment (No. 1) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 123 California street, Room 423, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 24th day of October, 1903, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on WEDNESDAY, the 18th day of November, 1903, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
CHAS. BOVONE, Secretary.
Office—123 California street, Room 423, San Francisco, California.

POSTPONEMENT.

Notice is hereby given that the date of the delinquency of the stock referred to in the above notice is hereby extended from October 24th, 1903, to November 11th, 1903, and the day appointed for the sale of delinquent stock in the above notice is hereby extended from November 18th, 1903, until December 7th, 1903, by order of the Board of Directors of said corporation duly entered of record.
CHAS. BOVONE, Secretary.

MACHINERY FOR SALE.

For Sale--Thirty Bottom Dump Cars,
ALL STEEL, ENTIRELY NEW. CAPACITY 5 CU. YDS., STANDARD GAUGE.
These cars set very low to track and can be readily loaded by hand. Suitable for handling stone, ore, shale, marl, or other material. An excellent car for contractors' use. Shipment can be made within 30 days. For further information, write
THE ATLAS CAR & MFG. CO., Cleveland, O.

FOR SALE.
Several Lots of New and Second-Hand Standard Rotary Mine Cars at a low figure.
Also, New and Relaying Rails---12, 16, 20 and 25-pound. Immediate delivery.
THE ATLAS CAR & MFG. CO.
CLEVELAND, OHIO.

FOR SALE.
Prescott Mine Pump.
NEW. NEVER INSTALLED.
Size 15 x 23 x 39 x 10 x 24 inches. Triple expansion, pot form, with air pump, surface condenser and appurtenances.
CLOVER LEAF GOLD MINING CO.,
Roubaix, South Dakota.

A COMPLETE CONCENTRATING PLANT
Can be bought at 12c on the $1. The machinery is of the highest type and in good condition.
One 200 h. p. Corliss Type Engine. Two Safety Tube Babcock & Wilcox Boilers, about 250 b. p. One 800-lb. High Mortar 40-stamp Mill, rapid drop. One 9x15 in. Blake Crusher. Eight Tullock Automatic Ore Feeders. Twelve Double-end 3-Compartment Hartz Jigs. One 4-Compartment Single Hartz Jig. Six Sets Revolving Screens, all housed in. Two Sets of Elevators, complete. All necessary Shafting, Pulleys, Boxes, Belting and most of the piping, etc. This plant has been used very little. It cost $100,000; if sold at once, will take $12,000 for it. Located on the D. & R. G. Ry.
S. S. MACHINERY COMPANY,
1529 Lawrence St., Denver, Colo.

Partial List of MINING MACHINERY FOR SALE.
5, 10 and 20-Stamp Mill, Concentrators and Rock Breakers.
1—150 H. P. Duplex Air Compressor.
1 Compound Norwalk Duplex Air Compressor, 17½x 26x30.
1 Double Drum Hydraulic Hoist, 2 6-ft. Pelton Wheels.
1—126" Pelton Water Wheel.
1 Double 10x12 Hendy Hoist.
1 Double 8x10 and Single 8x12 Hoist.
1 Direct Connected Electric Hoist, 4-ft. Drum.
2—3 H. P., 125-volt Westinghouse Motors.
1—150 H. P. Stanley Alternating Motor.
1—384 H. P. Stanley Alternating Motor.
1—30 H. P. Stanley Starting Motor.
1—200-ampere 550-volt Multipolar Generator.
1—75 H. P. Motor, 500 volts, connected with Dow Triplex Pump, capacity 350 gals. per minute, 500-ft. head.
1 Duplex Dow Pump, 28" stroke, 8" suction, 6" discharge.
2 Duplex Hookers, 6" suction, 5" discharge.
1 Worthington Duplex, 4" suction, 2" discbarge.
1 Compound Buffalo Duplex, 10x16x8½x10.
1 Knowles Sinking Pump, 10x10x14.
A number of smaller Pumps; 6" Jack Head.
800 H. P. of Return Tubular Boilers.
A number of Engines; 10 Air Drills.
5 Rock Crushers, various sizes.
8000 ft. 16-lb. Rail; 2, 3, 4, 5 and 6" Pipe.
2000 ft. 10-lb. Soft Steel Air Pipe.
We have not room to list everything. Write us, stating your needs. Address J. B. JARDINE, 220 Fremont St., or F. DEUTCH, 148 Second St., San Francisco, Cal., for further particulars.
Write for List B for machinery on band.

In addition to our large stock of Machinery, we have a number of complete plants of different kinds. Write us for specifications of any of these.

COMPRESSORS.
30x28x48 Rand Duplex.
24x30x60 Union Iron Works.
24x24¼x30 Ingersoll-Sergeant Straight Line.

22ND AND LARIMER STS., DENVER, COLO.

FOR SALE—ONE 6" x 30" HIGH SPEED CRUSHING ROLL.
Made by Colorado Iron Works. Used six months. Cost $1300. Price, $450 cash. G. L. BROOKS, Albuquerque, N. M.

FOR SALE.
A paid-up Hydraulic Engineering Scholarship in the International Correspondence Schools of Scranton, Pa., for sale at a sacrifice.
Address 1268 Harrison St., Oakland, Cal.

FOR SALE.
Cinnabar Property, Over 180 Acres, in El Dorado County, California.
PARTIALLY DEVELOPED.
BERNARD CINNABAR MINING CO., Room E, Academy of Sciences Building, San Francisco, Cal.

DELINQUENT SALE NOTICE.

INYO MARBLE COMPANY OF CALIFORNIA.—Location of principal place of business, San Francisco, California; location of works, Inyo, Inyo County, California.

NOTICE—There are delinquent upon the following described stock, on account of assessment (No. 37) levied on the 18th day of August, 1903, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Cert.	No. Shares.	Amt.
Geo. Dillmann	530	980	$49 00
F. A. Berlin	487	400	20 00
Nathan Bibo	551	60	3 00

And in accordance with law, and an order from the Board of Directors, made on the 18th day of August, 1903, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, Room 30, fifth floor, Mills Building, San Francisco, California, on WEDNESDAY, the 18th day of November, 1903, at the hour of 3 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

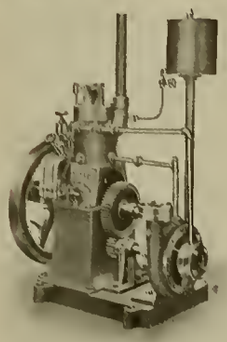
CHARLES E. ANDERSON, Secretary.
Office—Room 30, fifth floor, Mills Building, San Francisco, California.

DELINQUENT SALE NOTICE.

LARKIN MINING COMPANY.—LOCATION OF principal place of business, San Francisco, California; location of works, El Dorado County, near Placerville, California.

NOTICE—There are delinquent upon the following described stock, on account of assessment (No. 15) levied on the 21st day of September, 1903, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Cert.	No. Shares.	Amt.
Alex. P. Christie	192	300	$7 50
Alex. P. Christie	193	34	85
Harry P. Christie	196	300	7 50
Harry P. Christie	197	33	82½
Robert Christie	198	300	7 50
Robert Christie	199	33	82½
Chas. E. Elliott	284	250	6 25
E. A. Selfridge, Trustee	316	500	12 50
M. Yancy	335	100	2 50



And in accordance with law, and an order from the Board of Directors, made on the 21st day of September, 1903, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at 112 Main street, San Francisco, California, on MONDAY, the 16th day of November, 1903, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

N. F. REMINGTON, Secretary.
Office—112 Main street, San Francisco, California.

Cement Edition!
24 Pages, 10x12, of splendidly illustrated matter, educational in its scope, covering in a comprehensive way the wonderful growth of the American cement trade and the many remarkable aspects of this remarkable industry. Will be mailed on receipt of 10 cents and mention of this paper.

Traction Dredges,
Dipper and Clam-Shell Dredges,

Suitable for all kinds of Excavating Work, also Digging Ditches, Leveeing, Canal Construction, etc., making a specialty of
PLACER MINING MACHINES,
separate or self-contained, either as a dry land excavator or floating dredge.

We make our own Steel and Grey Iron Castings also our own Chain.

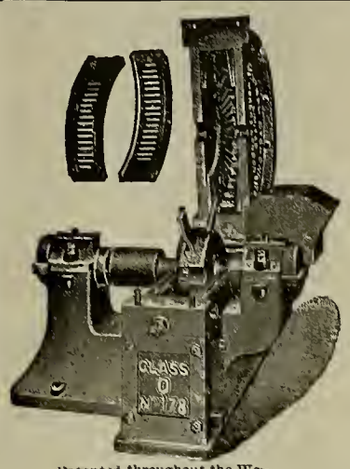
GEO. W. BARNHART, Western Manager,
No. 4 Sutter St., SAN FRANCISCO, CAL.

SMOOTH-ON IRON CEMENTS

Unequaled for boiler patching, stopping leaks in boiler seams, piping, around rivet heads, etc. Smooth-On when mixed with water becomes a hard metallic iron that expands and contracts the same as iron and withstands fire, water, steam, or oil. When applied to a blemish in a casting the blemish is removed. Sold in 5, 10 and 25-pound tins. 60-page illustrated book free. When ordering state for what use.

Sole proprietors and manufacturers, SMOOTH-ON MFG. CO., Jersey City, N. J.

WESTERN REPAIR & SUPPLY CO., Agents for Pacific Coast,
40-42 East St. and 61-63 Steuart St., SAN FRANCISCO, CAL.



REMEMBER,
Leviathan Belting

may be subjected to the most excessive conditions, be they heat, steam or moisture, without injury. NO PARTS TO SEPARATE.

WILL OUTWEAR TWO RUBBER BELTS.

MAIN BELTING COMPANY,
55-57 Market Street, Chicago.
Philadelphia, Boston, Buffalo.

CONVEYORS and ELEVATORS.

INTERIOR VIEW OF THE
CYCLONE
FINE GRINDING ORE
MILL.

Has been used for wet process but built and intended for dry grinding.

FIVE SIZES.

BUILT FOR HARD WORK,
SELF-OILING,
RUNS LIKE A WATCH,
LARGE OUTPUT,
SMALL HORSEPOWER,
FINEST POWDER IF DESIRED.

IT GRINDS FAST.

No Bolts and Nuts in our Mill Wheel to work loose and wear out.

In stock in Chicago.

Patented throughout the World.

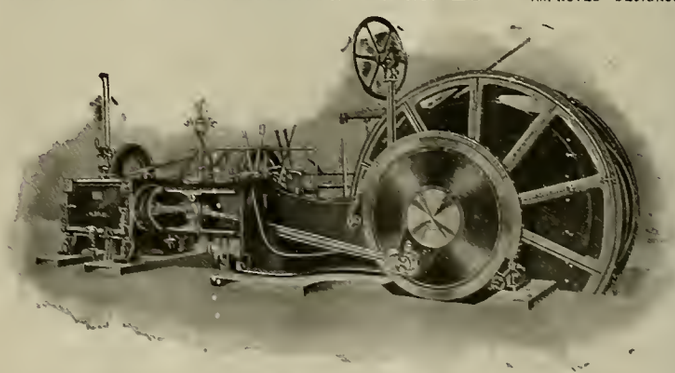
E. H. STROUD & CO.
AGENTS AND MFRS. FOR UNITED STATES, CANADA AND MEXICO.
30 TO 36 LA SALLE STREET, CHICAGO, U. S. A.
SAN FRANCISCO—C. P. Low, 19 Spear St.

REGAL METALLIC PACKING.

THE ORIGINAL, GRANULATED AND LUBRICATED METALLIC PACKING.

It is a combination of the finest metal and graphite in granular form, and for convenience of handling it is put in thin cotton tubes, all sizes, as shown.

Goes in the ordinary Stuffing Box.
Reduces friction.
It always remains lubricated.
Can be used over and over again.
It never wears out.



Send for Description.

REGAL PACKING CO.,
1402 Monadnock Bldg.
CHICAGO, ILL.

Uniform Measurement of Water.

The different methods of measuring water, and the variance of the terms employed to express quantity of water used or required, render an understanding of this subject somewhat confusing. The idea of measuring water for the use of mines and metallurgical establishments probably originated in California during the early years of placer mining, when the mines were owned by one party, while the water necessary to work them was often controlled by another. Originally water was measured by flow over an open weir, but subsequently an arrangement was made to measure a given quantity flowing through an aperture under pressure. Miners and ditch owners established different regulations in the several districts of California. The shape of the orifice through which the water flowed varied in the several districts, and the thickness of the board through which it flowed ranged from 1 to 3 inches. Some apertures were beveled, others were square. Each of these differences had a direct effect on the quantity of water which would be discharged through an opening of given size in a stated time (one minute), but a still greater difference resulted from a variation in the height of the surface of the water above the center of discharge. This varied from 4 to 6 inches in the several districts. In addition to this the "hour-inch" varied. In some counties there were 10, 11 or 12-hour inches, and in some a 24-hour inch. All this variation was the cause of much confusion. Other States long since adopted one or the other of the California schemes for water measurement, there being no standard prior to 1900, when the State Legislature of California created a standard inch by fixing it at 1⅝ cubic feet of water per minute through any kind of an aperture or over any sort of weir.

The measurement of water by cubic feet is preferable to any of the uncertain measurements of the variable miner's inch as formerly made, and its universal adoption is advised throughout the mining regions of the world. The duty of water varies greatly in the various uses to which it is put. On water wheels the power developed depends on height of fall, or head in feet, above the wheel. In stamp mills the quantity of water used per stamp or ton of ore crushed will vary with the ore. Where amalgamation is practiced inside the battery it is desirable to use as little water as possible, and keep the screens from clogging and the plates from banking up with sand. It assists amalgamation, both inside and outside of the mortars, and it is not economy to use more water than is necessary to accomplish this. If the ore be heavily sulphuretted a greater quantity of water will be required, and where large capacity is desirable it is also necessary to use larger amounts of water than when the output per stamp is less. In concentration the use of water varies with the size and type of machines used, and also with the character of material under treatment. The same conditions as to the use of water applies to cyaniding. Some ores require the use of more water than others. There is neither standard nor precedent to regulate the quantity of water employed in any particular metallurgical operation, and any attempt to establish one would prove futile for the reasons previously given. The metallurgists who best know the value of water are those who have charge of large operations in desert regions where the water is settled and pumped back for reuse owing to its scarcity. As these men naturally use as little water as possible they demonstrate that it is needless to employ more water than is required to perform certain mechanical functions in metallurgical operations. Many mill men make the mistake of using more water than is required, thus increasing the expense of ore treatment with no commensurate gain in any direction to offset the waste.

A Pneumatic Stamp.

The means for pulverizing the copper-bearing conglomerates in the Lake Superior region has always been an interesting matter. Various kinds of crushing devices have been tried, and the steam stamps, now in almost universal use there, have been evolved from the experience of the past. In principle they are similar to the old-time Ball stamps, the main difference being in their size and the greater force of the blows delivered. Twenty years ago a Ball stamp was considered as doing good work in crushing 125 tons daily. The Ball stamp of to-day crushes 500 tons or more of the same kind of rock. This is due partly to increased weight and size of the stamp head and to the larger pistons employed, and partly to different screens used, which is made possible by improved concentrating machinery. This copper district has always been a field for experimentation along practical lines, and the latest innovation is the introduction of a pneumatic stamp at the Mass mine, in Mass City, Mich. In the operation of this stamp compressed air will take the place of steam. If the power necessary to drive the compressors proves cheaper than steam, pneumatic stamps may supersede the old-time steam stamps.

THE mine and mill operators in the Missouri zinc districts have again resorted to a shut down of mines and mills to force up the price of spelter. This plan was resorted to in 1899 with satisfactory results, and it is expected that the price of zinc will be materially advanced in this instance.

THE Provincial Government of British Columbia has undertaken to compel James Dunsmuir to remove all Chinese from his Cumberland coal mines. Numerous indictments have been brought against the management, and a daily fine of $500 is the anticipated result until all Chinese are removed.

AS indicating the progress of modern mining equipment and practice in British Columbia, the statement is made that at the Granby mines at Phoenix it is the intention to operate a large mechanical shovel in an underground stope, probably by electricity. Two steam shovels are in use in the surface cuts, and their success and economy there suggested their use underground. No objection to this novel use of mechanical shovels in underground workings presents itself, if the character of the roof is such as to make its employment safe. Where heavy timbering is required to support a caving roof the application of the idea is impracticable, but there are many large stopes in mines where the ground stands well and mechanical shovels might be employed to advantage.

COLORADO is the scene of new labor difficulties, in the strike of the coal miners. The strike covers all of the large coal mines of the State and many small ones, and temporarily stops the production of that class of fuel. Although the strike was called only last Monday, already the use of dynamite has entered in the campaign, in the attempt made to destroy an electric power plant at Hastings, 20 miles north of Trinidad, on the 10th inst. About 11,000 men have gone out of the mines, and in New Mexico a large number has been called out. Attempts have been made to extend the strike into Wyoming; but thus far without great success. The demand of the miners is for an eight hour day and increased pay, and other concessions, concerning the weighing of coal. The several mining companies have shown no disposition to meet any of these demands. It is thought the militia will be sent to the scene of the present trouble.

IN response to a popular demand, Governor Toole of Montana has called a special session of the State Legislature to convene December 1, for the purpose of taking some legislative action that will put an end to the seemingly interminable litigation in Butte mines. In view of this prospective remedy, the mines controlled by the Amalgamated Copper Company in Montana have resumed work throughout the State. It is expected that the State Legislature will pass a fair-trial law, which will permit dissatisfied litigants to secure a change of venue. Doubtless, also, a law will be passed which will permit corporations not organized under the laws of Montana to hold stock in Montana corporations, as Judge Clancy has decided that the Amalgamated Copper Company, a New Jersey corporation, could not hold the stock of the Butte & Boston or the Parrot Silver & Copper Company, these being Montana corporations.

False Economies.

In mine management economy is always a praiseworthy, and usually a necessary, feature of the business. Some managers have a strange idea of economy, however. One who had the direction of operations at a large mine, where a great many men were employed, would grow excited when he saw men standing idly at a windlass at a prospect shaft, waiting for miners 60 feet below to finish filling the bucket—would excitedly inquire of the superintendent why they were not at work, suggesting that they "dig trenches" or "chop wood," instead of idling away their time. In the mine, when he saw a number of men standing or sitting about the station, he would want to know why they were not at work. It was explained that they had fired a round of holes in the stope a few minutes previous, but as the ventilation was bad they were waiting for the smoke to clear up. There were ten men in this stope. It required three-quarters of an hour to dissipate the gas to an extent which would permit the men to return to the stope in safety, and then it was so "thick" it would cause the eyes to smart and develop a bad case of powder headache in those unaccustomed to it. The stope should have been cleared in twenty minutes had proper ventilation been provided, but a larger blower would cost about $300, and the idea could not be entertained by so economical a manager. Each day there was a loss of time in that single stope the equivalent of $3 in money, and in most other stopes, of which there were several, the condition was as bad, if not worse. Had the proper arrangement been made, the entire cost of the improvement could have been saved in a single month.

It costs several hundred dollars to cut and properly timber a good-sized ore pocket on each level under the station at the shaft, but it costs money, too, to have men wait for the skip to come, that they may dump the carload of ore. Where these ore pockets are not provided the skip seems always waiting for ore, and the car men seem to be usually waiting for a skip.

False ideas of economy such as here referred to are responsible for many mine failures. A manager should be as economical in the use of other people's money as he would be in the use of his own, but economy when directed along such lines as here indicated is parsimonious, and is equivalent to gross extravagance.

A Water Famine.

Mining has not proven to be a transitory industry in California. For more than fifty years the mineral deposits of the State have been vigorously exploited. New discoveries are of frequent occurrence in both old and new districts. Some of the mines of the early 50's are still in operation, and there is no indication that the mining industry in that State will not continue to thrive for many years to come. Still, notwithstanding these facts, there is in some directions a strange lack of foresight in providing an adequate water supply to meet the requirements of the dry months of late summer and fall. In Tuolumne county is this condition particularly noticeable. Almost every fall for years past many of the mines of that county are idle, because of insufficient water to supply the mills, and in some cases the hoists. Ordinarily progressive, that section shows a peculiar apathy to its own best interest in keeping the mines in operation. When electric power was introduced into that county to supply power to the various mining companies it was predicted that the water supply would thereafter prove abundant for all essential purposes. This was several years ago—1895-96—but the past summer and fall there are numerous mines in Tuolumne county which have been idle owing to lack of water. The rainfall and snowfall in the Sierras is abundant enough in any year to supply all needs if the storm water, or even the water flowing from the melting snows, be conserved in proper reservoirs, but for some reason this is not done, and the mining industry there gets an annual setback in consequence.

The Necessity for Drainage.

The Cripple Creek, Colo., drainage tunnel is a success, as drainage tunnels generally are, but the slow rate at which the water level is lowered in mines adjacent to the tunnel which are not connected directly with it, suggests the advisability of starting another tunnel at a lower level as soon as possible, in order that sufficient time may be given to drain an extensive area below the level of the present tunnel before it becomes necessary to enter that ground in search of ore. At present the water level is lowering in the Elkton and Mary McKinney mines at the rate of about one foot per week, or about 50 feet in a year, if this rate were maintained; but, as the water level lowers, the pressure decreases, and the rate of flow will be a decreasingly smaller amount from month to month.

Doubtless these facts are recognized by the mining engineers of the Cripple Creek district; but as long as ore is available the matter is given less serious consideration than it should receive. When the mines are worked down to the present tunnel level it will be impossible, judging from past experience in that direction, to go below the water line without pumping plants of far greater capacity than any heretofore placed in there. In view of this fact, and in consideration of the long time which will probably be required to drive a lower, and, consequently, a much longer tunnel, to reach the mines now being drained by the tunnel recently driven, this work should not be delayed. Moreover, the present condition and progress of drainage demonstrates that several years would be required to drain the ground below the present tunnel level to a depth of 250 feet, for it is scarcely likely that it could be drained at as rapid a rate as that obtaining at present. If this work is not undertaken in time to have a new tunnel well advanced into the ore-bearing zone by the time the ground is worked out above the present drainage tunnel level, there will come a halt in Cripple Creek's mining operations at that time, and several years of patient waiting must follow pending the completion of a new tunnel.

A NUMBER of residents of the Soulsbyville and Carters mining districts in Tuolumne county, Cal., on the 11th inst. waited on the superintendent of the Black Oak mine at Soulsbyville and demanded the discharge of the Chinese ore sorters who have been employed there for years. The demand was refused and the objectors then ordered the Chinese to leave, providing wagons for the conveyance of themselves and effects to Sonora. The pumps were withdrawn from the Black Oak shaft and all work stopped. The company had been paying $1.75 per day to Chinese for cobbing and sorting shipping ore. The Miners' Union demanded that the pay be increased to $2.50, to which the management would not agree. The Black Oak is one of the largest mines in Tuolumne county and has been operated steadily for more than twenty years, and has been for years the main support of Soulsbyville. This step is one of the most radical yet taken by the Miners' Union in Tuolumne county, where they are strong, and it is not unlikely that this move, like others of the sort in other States, will result in ultimate loss.

AS an aftermath of the strike at Morenci, Ariz., last summer, when an organized body of men sought to terrorize the inhabitants of that town, and were only restrained by the militia from murdering those against whom their wrath was particularly directed, ten of the leaders out of the fourteen who were indicted were found guilty and sentenced to terms in the penitentiary at Yuma, together with heavy fines. The promptitude with which these cases were brought into court and final action secured is praiseworthy, and this example will no doubt have a salutary effect on those who may be disposed to act in similar manner. It simply indicates that the people of Arizona propose to reserve to themselves the right to conduct legitimate business in their own way without interference from a lot of foreign renegades.

CONCENTRATES.

TRACTION engines have been successfully used on the deserts of Arizona and California freighting copper ore and rock salt.

✦✦✦✦

IN the Hidden Treasure mine at Sunny South, Placer county, Cal., the white gravel channel is over 1600 feet in width, the greater part of which is mined.

✦✦✦✦

CONCRETE may be mixed with machines designed for that purpose; but some engineers, in their specifications on contract work, specify that no machines shall be employed, all concrete mixing being done by hand.

✦✦✦✦

THE length of a minute of latitude varies with different distances from the equator or the poles. At the equator it is estimated at 1852.8 meters, at 20° it is 1845 meters, at 40° it is 1850.5 meters, and at 70° 1859.1 meters.

✦✦✦✦

WHERE an association of eight or more persons locate a placer claim of 160 acres, it is not necessary to make a separate discovery on each 20-acre tract of the claim and $100 worth of annual assessment is all that the law requires for the 160 acres.

✦✦✦✦

PROTOGINE granite is a variety of granite breaking with a granular or sandy fracture, with large amount of quartz and little dark mica. Sericite, a silky white mica, is abundant, with white orthoclase, and microcline. As accessory, are garnet, pyrite, etc.

✦✦✦✦

THE character of mill screen should be adapted to the rock under treatment. A woven wire screen which gives satisfaction on a granular ore may not prove suitable on a flinty ore which crushes in flaky particles. For the latter slotted screens are better suited.

✦✦✦✦

WHEN estimating the power that will be required to operate mining and milling machinery it is economy to add at least 50% to the estimate in view of future extensions, and a higher factor for safety is advisable. Machines seldom develop the power theoretically figured.

✦✦✦✦

THE so-called cotton balls of the borax marshes of Nevada and California are the result of efflorescence from the mud of the shores of the lake. When water collects on the lake all the soluble borax goes into solution. When the water is evaporated it sinks into the mud, which upon further evaporation causes the above-mentioned efflorescence.

✦✦✦✦

"FLUORINE" is a name given by the miners of the Cripple Creek, Colo., district to ore containing fluorite of amethystine color. It is often accompanied by tellurides gold ores in that district. Fluorite, or fluor spar, is common in the zinc and lead mines of the world. It occurs in various colors, purple or amethyst being the most common. It is also green, rose-colored and white.

✦✦✦✦

TRAMMING with wheelbarrows is expensive economy, and is only justifiable when a small amount of earth or rock is to be moved. In some mines wheelbarrows are used in filling stopes. If proper arrangements were made the filling could be run in without the necessity of tramming of any sort. These are the things which require foresight and which count in the economies of mining.

✦✦✦✦

MECHANICAL arrangements for handling timbers underground, particularly at shaft stations, expedite work and reduce cost of labor. In mines where large amounts of timber are used in the stopes the timbers should be taken off the cages or skips at the station on the level above that where the timbers are to be used, and lowered through raises driven connecting the levels, and passing through the stopes.

✦✦✦✦

A VEIN may be said to have two hanging walls in the case of a lens-shaped ore body standing vertically with walls dipping in opposite directions, but this is merely of local occurrence, for where the lens begins to "pinch" in its downward course it may be said to have two foot walls. Foot and hanging walls are relative terms and refer to the general dip of the vein or lode, and where a vein stands absolutely vertical it really has neither foot nor hanging.

✦✦✦✦

THE order of drop of stamps—1, 4, 2, 5, 3—is not universally employed, but is recognized as a satisfactory sequence of drops by many millmen. The statement that the order—1, 3, 5, 2, 4—is a bad order of drop is not sustained by fact, as when the order 1, 4, 2, 5, 3 is given them, the order 1, 3, 5, 2, 4 results if the point of beginning is at No. 5 instead of at No. 1. It is the aim that no two adjoining stamps in a 5-stamp battery shall drop consecutively. It is also desirable to keep the pulp evenly distributed.

✦✦✦✦

STAMPS drop from 28 times to 110 times per minute, according to height of drop, and beyond the latter number of drops it is not safe to go, on a 5-inch fall, for if the cam-shaft be revolved at a greater speed than fifty-five revolutions the tappets will strike the cams, unless the height of drop be lessened materially, and the stamps will not reach the rock on the die beneath, besides which there is great danger of breaking the arms of the cam. Two hundred revolutions with 400 drops per minute is a physical impossibility with cams of the usual size and shape.

✦✦✦✦

THERE are several prominent faults in the Leadville, Colo., district, the greatest one being the Mosquito fault, the displacement of which is about 5000 feet. Other noted faults are the Carbonate fault, on the west side of Carbonate hill, displacement 750 feet; the Iron fault, on Iron hill, displacement 1200 feet; Mike fault, between Iron hill and Breece hill, displacement 50 feet. Besides these there are a number of others of minor importance. The amount of displacement varies greatly from place to place. These faults have had an important bearing on the economy of mining in Leadville mining district.

✦✦✦✦

WHEN A puts a mining location notice on a claim on Sunday, but, fearing a legal location cannot be made on Sunday, dates it Monday, and B puts up a notice subsequently, dating it on the previous Saturday, no rights are obtained by B. It is a question of fact, and while the reading of the location notice—In this case Monday—is prima facie evidence that the claim was located on that day it may be set aside upon it being shown that the first steps in making the location were taken on Sunday. A location made on Sunday is legal and as valid as one made on any other day in the week.

✦✦✦✦

A CONVENIENT method of assaying cyanide solutions for gold and silver is as follows: Evaporate 29.2 cubic centimeters of the solution to dryness in a lead tray. Roll up the lead and cupel, weighing the resulting button. Should the solution be known to contain more than .2 ounce of gold per ton it is advisable to scorify the lead with borax glass before cupellation. The lead tray should be about 2x3 inches, and weigh about twenty grammes. The solution in it can be quickly evaporated by placing on an asbestos board over a Bunsen burner. If no Bunsen burner be available the slower process of the alcohol lamp may be resorted to.

✦✦✦✦

IT is impossible to determine whether a vein passes downward from one kind of a formation into another beneath it, without following the vein to that point. The presumption is that it does, but the question of values is important and can only be learned by actual development. The character of rock through which a vein passes usually has an influence on the physical condition of the vein whether there be a change in values and character of minerals or not. Veins in slaty rocks generally present a banded structure, and those in massive rocks are more massive, with sometimes a banded structure along the walls.

✦✦✦✦

DIAMOND DRILLS can not be economically employed in boring through rocks much shattered and broken, for the reason that water can not be made to remain in the drill hole, it running away in the crevices of the rocks. In compact, soft ground, such as slate, the diamond drill will cut rapidly, but no cores are obtained. Samples may be taken of the fine cuttings forced back by the stream of water; but such tests are not wholly reliable. When the rock is hard and a core is obtained, this will give a good idea of the value of the ground at that place; but a series of holes is necessary to learn the size and shape of any ore body that may be met.

✦✦✦✦

ANORTHITE is lime feldspar, and occurs in some diorites and basic schists, also in diabase, gabbro, norite, etc.—not a very common mineral. Anorthosite, or anorthite rock, is a gabbro in which anorthite occurs abundantly, almost to the exclusion of other minerals, forming sometimes 95% of the rock. It is usually coarse-grained. It occurs extensively in the Laurentian of New York and Lake Superior region, in Labrador and Newfoundland. A similar rock occurs in Los Angeles county, Cal., forming a large portion of Mount Gleason, near Ravenna. In it occur large masses of iron ore, magnetite, and in one locality veins of quartz containing gold and auriferous pyrite.

✦✦✦✦

WHEN lead-silver bullion is melted and allowed to cool slowly to near the melting point, crystals of lead will separate out which are much poorer in silver than the original bullion was before melting. This fact is taken advantage of in refining this class of bullion in the Pattison process. The crystals of lead are skimmed off and more bullion added, when new lead crystals form which in turn are skimmed off. In this manner the precious metal of a large amount of lead bullion is concentrated, and the lead, poor in silver and gold, obtained separately. The concentrated gold-silver-lead bullion, containing a relatively small amount of lead, is then cupelled, and the gold and silver refined.

✦✦✦✦

THE mere occupation of land on the public domain for twenty years without a proper filing in the land office—being what is termed a squatter's claim—does not vest the squatter with any rights as against a bona fide mineral locator, who peacefully enters the tract and locates a vein thereon. The mineral locator must perform the assessment work and other acts required by the United States and local laws, but whether the vein is commercially valueless or not is difficult of determination. The law simply says "mineral bearing rock in place," and makes no mention of the value of the mineral so contained. The locator is left to judge of its value, on the presumption that if the vein be valueless he will abandon the claim.

✦✦✦✦

BOTH masonry and concrete are occasionally employed in American mines but are more common in Europe. It has been found that concrete is often advisable at the collar of shafts, either inclined or vertical. Steel is also used in mine support to a limited extent. In shafts it might be employed to advantage, and would prove a perfect protection against fire. Under heavy pressure it would probably prove a dangerous substitute for timber, as it would give little warning of collapse; and if it gave way under the strain would come without warning, whereas in workings supported by timbers there is always sufficient indication of approaching disaster—sufficient in most cases for men to escape, if not to prevent collapse. Filling is the only safe course to pursue, as no timber will support heavy ground perpetually.

✦✦✦✦

THE term "limestone dike" is a misnomer. Dikes are intrusive—injected in molten condition from below. Sedimentary beds, such as limestone, quartzite, sandstone, shale, etc., are not dikes. These latter are sometimes called reefs. Eruptive rocks are also intruded in flat sheets in horizontal formation. These are called sills. Should the formation be upturned subsequently these sills might be mistaken for dikes, or dikes thrust upward into rock strata standing at a high angle might be mistaken for sills if earth movements caused the inclosing formation to assume a recumbent position. In studying the stratigraphy of rock masses care must be taken not to mistake slaty cleavage for lines of sedimentation. The former is induced by pressure and movement, the latter by deposition of the rock material in water. Cleavage planes and lines of sedimentation may coincide.

✦✦✦✦

THE most universally used means of precipitating gold from cyanide solutions is by means of threads of zinc. In a few works the gold solution is run through charcoal filters, which collect the gold, which when well charged with the precious metal is dried and incinerated in a furnace of proper construction. It has been found in practice that a series of charcoal filters afford the most satisfactory results, a single one rarely recovering more than 25% of the gold. Charcoal is successfully employed to precipitate gold from chlorine solutions. Iron sulphate is also used for this purpose. Sulphuretted hydrogen will precipitate gold from both bromine and chlorine solutions containing it. Mercuric chloride will precipitate gold from gold solutions of cyanide, and action is facilitated by heating the solution, but it is limited in its usefulness, as in the presence of free potassium cyanide no precipitation of gold occurs.

✦✦✦✦

IN the determination of zinc ores only volumetric methods are employed in practical working. There are two volumetric methods: titration with a standardized solution of potassium ferro-cyanide; and titration with a standard solution of sodium sulphide. The ferro-cyanide method is preferable, and is based on the fact that salts of zinc decompose potassium cyanide in an acid solution, forming a white compound of zinc which is insoluble, and that an excess of ferro-cyanide is detected by a brown coloration of the solution produced by uranium acetate or nitrate. To prepare the standard solution of potassium ferro-cyanide 28 grammes of the pure salt are dissolved in 2000 cubic centimeters of water. In standardizing two parts of 0.200 gramme each of pure zinc oxide (which has previously been ignited to convert any zinc carbonate present into zinc oxide) are dissolved in 10 cubic centimeters of pure muriatic acid. Add 7 grammes of pure ammonium chloride and 250 cubic centimeters of hot water and titrate with the solution of ferro-cyanide. As the end point is approached a drop of solution is occasionally removed from the glass stirring rod and added to a drop of uranium acetate or nitrate placed on a porcelain plate. As long as there is not an excess of ferro-cyanide in the solution the uranium acetate will retain its yellow color, but as soon as the ferro-cyanide is in slight excess the uranium acetate will turn a light brown. The titration should be carried to a point where the light brown color appears with a drop of uranium acetate. About 16 cubic centimeters will be required, and that amount may be run in from the burette before making the test, but the titration should be finished carefully by testing after each additional drop of ferro-cyanide. As soon as the brown color is obtained a note should be made of the reading of the burette, wait a minute or two to see if some of the tests already made have not developed the brown color. Generally it will be found that the test has proceeded too far and a correction must be made accordingly. A further correction must be made for the amount of ferro-cyanide necessary to produce the brown color without the presence of zinc. In calculating the result it will be considered that 200 milligrams of zinc oxide contain 160.6 milligrams of zinc; 1 cubic centimeter of ferro-cyanide solution made up of 44 grammes per liter will be equal to 0.01 gramme of zinc, or about 1% when 1 gramme of ore is taken for assay. The uranium acetate solution is prepared by dissolving a quantity in water, making a strong solution, which is clarified by adding a few drops of acetic acid. It should be kept in a tightly stoppered bottle in a dark place. The ferro-cyanide solution should be kept in a dark-green bottle, well stoppered and not exposed to strong light.

Assaying of Gold and Silver at the United States Mint.

Written for the MINING AND SCIENTIFIC PRESS by JOHN W. PACK, First Assistant Assayer United States Mint, San Francisco.

The gold and silver brought to the Mint are in a great variety of conditions. It may be bars, having already been melted, or nuggets and grains, as taken from gravel deposits, or in amalgam or retorts from mills.

To ascertain the amount of gold and silver in these deposits, they must be carefully assayed. And to obtain an accurate sample from a deposit it must first be melted and carefully mixed when thoroughly melted. A gold deposit after melting and being cast into a bar is then sent to the assay department, where two chips are taken from the diagonal top and bottom corners of the bar. These two samples are then hammered and rolled out in thin strips for greater convenience in cutting when weighing.

The fineness of the metal is expressed in thousandths, hence it is found more convenient to employ the French system of weights, using the half gram as the unit of 1000 parts, with decimal divisions of ten thousandths of that weight. The assay of a sample of pure gold would be represented by an assay of 1000 fineness.

After weighing accurately 1000 weight (or one-half gram) of the samples taken from the bar, there is added to each of these assays sufficient fine silver to make an alloy containing twice as much silver as gold. Three parts of silver to one of gold has been used, but two parts is found to work more satisfactorily. By practice one becomes able to judge of the amount of gold in his sample and is guided by his estimate of the fineness in addition of silver.

The weighed-up portions of each sample with the silver added to each are now placed in two pieces of lead foil of about 40 grains for each crude assay, and about 30 grains of lead for fine gold assay; also a very small amount of pure copper is added where no copper is present in the sample. This addition of copper has a tendency to keep the metal tough after cupellation.

The metal after being securely rolled in the lead is placed in a cupel, which has already been heated to the proper temperature in the muffle. The door of the muffle is then closed till the lead melts and begins to oxidize freely; the door is then opened part way to allow for more rapid oxidation. After the lead and other base metals are eliminated the cupel is removed from the furnace and the button allowed to cool and harden. It is then removed from the cupel, hammered and brushed to remove any particles of bone ash, then annealed and rolled into a strip about 2 inches in length. This strip is again annealed and rolled up loosely. The metal in the assay is now ready for parting, or separating the silver from the gold.

The object in adding the fine silver to the assay previous to cupellation is to form an alloy in which the particles of gold will be so far apart that the nitric acid may have free access to all the silver contained, and thus insure its being dissolved, the gold meauwhile retaining the shape into which the strip was rolled. The rolled strip is now dropped into a flask or matrass containing 1 ounce of nitric acid (of 32°, Baume hydrometer), which has already been heated.

The assay is boiled in this acid for ten minutes, then the solution is poured off and the assay recharged with fresh acid of the same strength and boiled for ten minutes more. After this second boiling, the gold remaining, still retaining the form into which the strip was rolled before boiling, and technically termed a cornet, is washed with distilled water, then deposited in a small clay annealing cup or crucible, which is placed in the muffle and heated to redness, that the cornet may be thoroughly annealed.

This gold cornet is then weighed back, the resulting weight, less the silver surcharge remaining, being the gold fineness of the sample. The two samples taken from the bar must agree in fineness. If, in making up the assay, there have been three parts of fine silver added in place of two parts, then the assay is first boiled in nitric acid of 22° Baume for ten minutes, and then, on the second boiling, acid of 32° Baume.

Then, for the determination of the base metal and silver in the samples under consideration, one-half gram or 1000 weight of the metal, is taken, inclosed in a piece of lead foil, 40 grains ordinarily, or 80 grains if much copper is present in the sample. After the cupellation, the resulting button containing the gold and silver is weighed, the loss indicating the proportion of base metal. The fineness in gold having been ascertained from the weight of the cornets, the fineness of the silver is determined by deducting the combined weight of the gold and base metal from 1000.

Proof or test assays, the object of which is to detect any inaccuracies, accompany all assays of samples of bullion. These proofs for the gold assays are made from pure gold (1000 fine). For proof of base metal assays gold of 999 fineness, and for gold coin or ingot metal the proof is made from gold 900 fine, or of 900 parts in 1000.

The assays are usually treated together in sets, comprising assays of eight samples of different gold deposits. A proof accompanies each of these sets, and its fineness approximates the average fineness of the eight assays, if they do not greatly vary. Proofs accompanying the gold assays of crude gold deposits are usually made as follows: 1000 weight, or one-half gram of pure gold, is weighed up; to this is added 2000 of silver and 30 of copper, all of which is neatly rolled in a piece of lead foil weighing 40 grains.

Proofs for fine gold deposits—that is, gold 990 fine or more—are as follows: Pure gold weighed up 1000, silver 2000, copper 30, with 30 grains of lead. Proofs for coin metal: Pure gold 900, silver 1800, copper 100, with 60 grains of lead. Proof for base metal: Gold of a standard fineness is used, not necessarily 1000 fine; ordinarily the gold used in making this proof (999 fine) is made from cornets that have been melted. Of this gold a 900 weight is used, with 90 of silver, 10 of copper and 40 grains of lead. The exact amount of gold in the proof accompanying the assay for base metal being known, any deviation from this amount after cupellation is used in making the necessary correction upon the assay of the sample taken from the bullion deposit.

Example: If the base metal proof shows a loss of 8 in place of 10, which was the amount of copper added, and the assay of sample shows a loss of 30 after cupellation, then a deduction of 32 is made for the base in the sample. If the proof shows a loss of 12, and the assay of sample 30, then a deduction of 28 is made for the base. The proof accompanying the gold assay is to detect any possible inaccuracy which may occur either in cupellation or in dissolving the silver from the cornet, and also for affording a basis for the necessary correction for surcharge. The surcharge in an assay is the very minute amount of silver which still remains enclosed within the gold cornet, even after persistent boiling in nitric acid, and varies from two-tenths to eight-tenths of a thousandth—the smaller the amount of gold used in making up a proof or other assays the less the surcharge of silver will be.

When it is ascertained from the proof which accompanied the assays of the samples, and which received the same treatment throughout the operation, what the exact amount of silver retained by the proof cornet is, we then deduct this amount of surcharge from the absolute weight of each cornet resulting from the assays of the samples under treatment.

Example: Proof cornet weighs 1000.5, knowing we have weighed up but 1000 of pure gold, the .5 represents the surcharge; if the cornet from the assay of sample weighs 875.5, we should deduct .5, giving correct fineness 875.

As stated before, two samples are made from each deposit of gold, each sample being weighed and treated by different men in the department, neither having any knowledge of the other's results until the work is checked, and no one in the department being cognizant of the identity of the depositor until after the results are obtained.

If upon checking the results from the two assays of a deposit we find them to disagree, the deposit from which the sample was taken is remelted and well stirred to make a uniform mixture of the metal, which is again sampled and assayed.

In preparing gold or silver for coinage the proper amount of copper is added to the fine gold or fine silver, 10% of copper being used in either case. When this has been thoroughly melted and mixed it is cast into ingots. In case of gold the first and last ingot of each melt is taken to the assay department where a chip is taken from each for assay. The silver ingot melts are sampled previous to pouring into their respective moulds by dipping out a small portion of the molten metal and granulating it by pouring it into water; these granulations are dried and delivered to the assayer for examination by the volumetric method to be hereafter described. If the resultant assays of either kind of ingots show their fineness to be within the legal limit of variance the ingots are considered suitable for coinage, otherwise the melt is condemned and eventually remelted.

When a gold deposit contains platinum it may be detected by the peculiar dark amber color of the nitric acid when the silver is being dissolved from the cornet. If platinum is present the cornet after being annealed is again cupelled as before with the exception that four parts of silver are added to one part of gold present; this insures a more perfect separation.

There are two methods used for silver assaying—by cupelling with lead or by the humid or volumetric method. As the method by cupellation is too liable to inaccuracies, even when great precautions are taken in the work, it is only used as an approximation upon which to base the working of the humid assay. The button resulting from such cupellation must be parted to determine the amount of gold if any be present.

Humid assaying is a method of determining the amount of pure silver in an alloy by means of precipitation of the silver from a solution with a precipitating agent of a known strength. For this purpose a solution of chloride of sodium or common salt is used to precipitate the silver as a chloride.

Two solutions of different strengths are used. The first is known as the normal salt solution, the second, or weaker, the decimal salt solution.

First prepare a saturated salt solution by adding to water at a temperature of 60° F. all the salt it will dissolve; when saturated it will be of a density of 25° B.

The normal solution is prepared by adding 2.07 parts of saturated solution to 97.93 parts of water.

The decimal solution is prepared by adding 100 cubic centimeters of the normal solution to a liter flask and then filling the flask with distilled water, or in other words, making a solution of one part of normal solution to nine of water.

When the fineness of the silver is unknown an approximate assay is made by cupellation. If the approximate fineness is known, as in silver ingot metal, or in foreign coins or in fine silver, that is silver almost pure, then a previous assay by cupellation is not required.

As the normal salt solution is based upon the amount of solution required to precipitate one gram of silver, the unit of weight for silver assaying is one gram, or the 1000 weight. As the normal solution will vary from many causes it is necessary to test it often with a proof. This is done by weighing up 1002 weight of proof silver (1000 fine), placing it in a special bottle and dissolving in nitric acid. Then a pipette holding 100 cubic centimeters is filled with the normal solution, which is added to the contents of the bottle, the greater portion of the silver is converted to a chloride of silver, which will appear as a heavy, milky, white precipitate. After placing a glass or rubber stopper in the bottle it is shaken for four or five minutes, either in an agitator or by hand, after which the silver chloride will settle to the bottom, leaving the solution above perfectly clear for further test with the decimal solution.

If the normal solution were correct it would precipitate just the 1000 weight of silver, leaving two milligrams still in the solution, as we had weighed up 1002 milligrams. Now from a small pipette a cubic centimeter of the decimal solution is added. This precipitates one of the two milligrams of silver remaining, which appears as a white cloud of silver chloride in the clear solution above the chloride already thrown down.

After shaking the bottle and adding another charge of decimal solution, we will then suppose that no cloud appears. We then know that the normal solution has precipitated 1001 of silver instead of 1000. But suppose upon the second charge of the decimal solution a cloud representing a half a thousandth more shows, this indicates the normal solution, being only .5 too strong, for we weighed up for the proof 1002 of pure silver and find the normal solution has precipitated 1000.5, leaving 1.5 to be precipitated by the decimal solution; hence the difference between the 1002 and the 1001.5 shown by the working is the correction to be made for each assay.

By experience one becomes expert in determining the density of the cloud thrown down by the decimal solution whether it donates more or less than one. This greatly assists in the work. Now knowing the density or strength of our normal solution we can proceed with the assay of the sample.

As before stated the silver sample is taken from alloy while melted, a small portion being poured into cold water and granulated, two samples being taken from each melt. From these granulations, after being dried, the necessary amounts for duplicates are weighed up.

To determine the amount to be weighed up, take the resultant silver fineness obtained by the approximate assay and divide 1000 by this fineness.

For example, suppose that fineness to be about 900: Then 1000 divided by 900 gives as the result 1.111, or it requires 1.111 gram of the metal to contain 1 gram of pure silver, but on account of the uncertainty of the fineness obtained by the approximation assay, we weigh up 1.115 gram in preference. These calculations can be avoided by the use of tables, as contained in Mitchell's works on assaying.

After dissolving the silver in a bottle with nitric acid and charging with 100 cubic centimeters of normal salt solution, suppose we have to add 3 cubic centimeters of decimal salt solution to precipitate all of the silver, the working of the sample is expressed in the following proportion:

$$1115 : 1000 + 3 :: 1000 : 899.5,$$

and as the proof indicates that the normal solution precipitates 1000.5 of silver, we then make correction of .5 on the working assay resulting in a true fineness of 900.

By referring to the tables before mentioned, the calculation to obtain the fineness is not necessary, but will be found opposite the amount indicating the weight used in the assay.

If the weight of the alloy taken for assay was not sufficient to contain 1000 of silver, then when the decimal salt solution charge is added no cloud of silver chloride will appear. In this case a solution of decimal nitrate of silver is used, of which each cubic centimeter will neutralize one cubic centimeter of the decimal salt solution. This is working in a descending scale and is not so desirable as working by the decimal salt solution, for the assay solution after shaking is not so clear, making it more difficult to read the cloud. If mercury is known to be present in the sample of silver, the addition of acetate of

soda to the assay will cause the mercury to remain in solution.

When the alloy contains other metals which prevent the solution in the bottle from becoming clear after shaking, we sometimes use a different method known as the synthetic humid assay, in which 500 weight or 1000 weight of the alloy is used and sufficient pure silver is added to make up a full gram for precipitation. If 500 is used, subtract the amount of pure silver added and multiply for the full gram; if 1000, simply subtract the silver added from the result.

When the silver also contains gold, an assay is also made for the gold by cupelling 1000 gold weight half a gram and then parting the button.

Proof gold is prepared by dissolving the gold cornets in nitro-muriatic acid—one part of nitric to two of muriatic acid—allowing to stand for several days to allow any silver present to settle. Then it is decanted carefully, the last portion being diluted with water and filtered. The solution of gold chloride is then evaporated partly till there is not so large an amount of free acid present. This gold solution is then diluted with water, and dropped slowly into a vessel containing pieces of pure aluminum which converts the chloride of gold to metallic, after being washed, and any particles of metallic aluminum present being dissolved with more muriatic acid, it is again washed and melted, and rolled into thin strips for use.

The proof silver is prepared by dissolving fine silver in nitric acid, then precipitating as a chloride. This chloride of silver is either converted into metallic silver with aluminum in the presence of free muriatic acid, or is reduced to metallic silver with carbonate of potassium, then rolled into strips for use.

Consumption of Zinc in Cyanide Plants.*

NUMBER III.

Written by WALTER H. VIRGOE.

At the commencement of this paper it was stated that silver product was always much finer than gold product, and, consequently, much easier to reduce. On a plant situated in the State of Michoacan the cost of reducing metallics, exclusive of labor, fuel and crucibles, is 2.27 cents (Mexican) per fine ounce of bullion produced, and the cost of reduction of fines is not more than 29.28 cents per kilo of fine bullion produced. On another plant in the Territory of Tepic the total cost, inclusive of labor, fuel, crucibles, etc., is only 23 cents (Mexican) per kilo, and at this latter plant no metallics are produced which can not be returned to the boxes, and the product consisting of that material which will pass a 12-mesh screen has an initial fineness of 80% to 90%. Both the above-mentioned plants are treating chloridized ores.

A good deal has been said about the fouling of solutions by zinc, but no instance of fouling has so far fallen under my personal observations where the falling off of extractions could be attributed to zinc in solution. Such cases may occur when plant solutions are deficient in alkali in the form of lime.

A good deal has also been written and said about the great need that exists for a method to determine "available cyanide" in a plant solution in place of the present method, which determines free cyanide and part of the cyanide in combination with the zinc, or all that latter cyanide if much free alkali be present; although it is undoubtedly advantageous to know how much cyanide is present as free and how much as combined, yet at the same time the value of the cyanide combined with the zinc as available cyanide is very much underestimated, and practical results would be but little affected were such a method devised and in general use.

It has been known for years that zincic-potassic-cyanide is a solvent for gold and silver and an excellent solvent in the presence of lime or other alkali. The cuprons-potassic-cyanides are likewise solvents, as the author has pointed out in a previous paper, but they are, as would be expected, much less efficient than the zinc salt.

It is proposed, therefore, to take up the cudgels in defense of this salt and to show that its presence in solution is, if anything, more advantageous than harmful. The titration of a solution of zincic-potassic-cyanide depends entirely upon the degree of dilution of the solution. If a solution of zincic-potassic-cyanide be titrated, the cyanogen contents of which form the equivalent of 1% KCN, the yellow iodide color forms when about one-fourth of the cyanide has been titrated, indicating that the salt apparently splits up in this way:

$$2(Zn Cy_2\ 2KCy) + Ag\ NO_3 = 2(Zn\ Cy_2\ KCy) + AgKCy_2 + KNO_3.$$

Upon standing a few moments, the yellow iodide disappears and the solution clears up, and, if further $AgNO_3$ be added, the yellow cloud of silver iodide will again form and again gradually disappear until the full amount of silver nitrate has been added to combine with the 2KCy.

With dilute solutions the titrations are very unsatisfactory; it seems as though silver iodide is somewhat difficult of solution in dilute solutions, consequently, the more dilute the solution of this salt titrated, the greater the error of titration.

These remarks, of course, apply to the titration of this salt in the absence of alkali.

Where the phenomena of the clearing up of a solution, after the final titration point had apparently been reached, is observed in titrating a plant solution, the cause may be attributed to the presence of considerable zinc and lack of alkali in the solution.

Again, it is hardly necessary to point out that the zinc salt is titrated to a degree which depends upon the sufficiency or insufficiency of the amount of free alkali present. If the alkali be lime, one molecule of the zinc salt requires the presence of two molecules of lime, and the equations are, therefore, probably as follows:

1. $2(ZnCy_2.\ 2\ KCy) + 4\ Ca(OH)_2 + 2\ AgNO_3 = 2\ ZnCaO_2 + 2\ AgKCy_2 + 2\ KNO_3 + 2\ CaCy_2 + 4\ H_2O.$

2. $2\ AgNO_3 = 2\ CaCy_2 = Ag_2CaCy_4 + Ca(NO_3)_2.$

A plant solution should contain, if possible, sufficient alkali, in my opinion, to fulfill the needs of the above equation—that is to say, there should be at least one pound of lime in solution to every one-half pound of zinc.

In order to be sure that the solution contains the requisite amount of lime, the author advocates titrating the plant solution with and without the addition of lime water or a solution of soda or potash, and, if any difference be observed, adding the alkali till a constant reading is obtained. By this means the operator will find out how many pounds of lime of a known degree of purity should be added to each ton of his solution.

The author has never found in practice that the zinc in solution has any tendency to accumulate above a certain point, and, since this is the generally recognized state of affairs, if at any normal period in the working of a plant extractions should be correct with this amount of lime in solution, any subsequent falling off of results should be attributed to some other causes than to the results of titration. To make it more clear, a plant may start up with a 2% solution and the extractions may be 86%, there being plenty of lime in the solution; later on, when a normal period is reached, and the solutions contain the normal amount of zinc, titration results will record the strength of the plant solution as free cyanide plus combined cyanide in a more or less regular proportion. If the extractions are somewhat lower than they should be the strength of the solution might be raised to, say, 0.25%, when, if the extractions regain their original degree, there is no reason why they should not remain so since the zinc does not accumulate.

It has often been remarked that the addition of alkali to a plant solution entails usually a decrease in the percentage of silver values extracted while reducing the consumption of cyanide. The occurrence of such a phenomenon is due to the fact that the solution, having become deficient in alkali, titration results would record all free KCy and only a small part of that combined with the zinc in solution; the addition of free alkali would cause the recording as free cyanide of a larger percentage of combined KCy, and zincic-potassic-cyanide being a poor solvent for silver, the extractions of this metal would be liable to be lowered, and there would be an apparent decrease of cyanide consumption for the time being.

With reference to the extracting power of $(ZnCy_2)$ zinc-potassic-cyanide, 2 KCy, upon gold and silver in ores, Table No. 1 illustrates this, being a comparison of results obtained with a solution of this salt with and without the addition of lime and a solution of plain KCN.

The value of the addition of the alkali is obvious, and this salt is an excellent solvent for gold, though comparatively not so good a solvent for silver, even in the presence of lime, though this may be simply a question of duration of treatment. Without lime less

cyanide is available than with lime, as the following equations show:

$$1.—2(ZnCy_2 2KCy)+2Au+H_2O+O \quad 2AnKCy_2+ ZnCy_2+ZuK_2O_2+2HCy.$$

$$2.—H_2O+2(ZnCy_2 2KCy)+2An+O+3Ca(OH)_2= 2(AnKCy_2)+ZnK_2O_2+ZnCaO_2+ 2CaCy_2+4H_2O.$$

Again, Table No. 2 illustrates the action of zinc-potassic-cyanide in comparison with pure solutions of cyanide upon different classes of ore. Thus it is seen how excellent a solvent this salt is in certain cases, and how the extractions are accompanied with a much lower cyanide consumption.

Table No. 3 illustrates the solving power of a solution of cyanide containing lime, the solvent being in test No. 1 plain cyanide, in test No. 9 plain zincic-potassic-cyanide, and in the intermediate tests cyanide partly free and partly combined in varying proportions. These are the results of thirty-hour bottle tests.

When leaching tests are made in a laboratory on a small scale it is observed that even if glazed earthenware vessels be used, and every precaution taken, the recorded consumptions are greatly in excess of those shown by bottle tests, which approach very closely to practical results. On all plants the initial consumptions are much higher than those recorded after a few weeks of running. If a little zincic-potassic-cyanide be added to the solutions of the laboratory tests there is apparently much less oxidation of the solutions and the cyanide consumption is considerably decreased. Therefore, much of this initial consumption on new cyanide plants, hitherto attributed to absorption by new tanks, etc., is caused by oxidation of the solutions, and as the solutions gradually take up zinc the consumption of cyanide decreases till it reaches its normal level, the solutions being protected in some way by the presence of this salt, and, therefore, it might be highly advantageous in some cases to add zincic-potassic-cyanide to fresh solutions, and, of course, the requisite amount of lime, especially on such plants where the conditions produce a very small chemical consumption of zinc.

(TO BE CONTINUED.)

New Method of Extracting Copper from Sulphide Ores.*

Written by GUSTAVE GIN.

An aqueous solution of sulphur dioxide possesses the property of attacking oxide and carbonate of copper, forming an unstable sulphite of the binoxide, which is gradually transformed into a mixture of cupro-cupric sulphite and sulphate, according to the reaction:

(1) $3CuO + 3SO_2 = 3CuSO_3$

(2) $3CuSO_3 + CuO = Cu_2SO_3, CuSO_3 + CuSO_4$

Cupro-cupric sulphite ($Cu_2SO_3, CuSO_3$) is only slightly soluble in water, but is easily soluble in solutions of sulphurous acid or cupric sulphate. On heating the solution to 180° C. (under a pressure of 10 kg.) it loses sulphurous acid, while cupric sulphate and metallic copper are formed:

(3) $(Cu_2SO_3 + CuSO_3) = 2Cu + CuSO_4 + SO_2$

If the formulæ 1, 2 and 3 be grouped together, it appears that the reactions correspond to

$$4CuO + 2SO_2 = 2Cu + 2CuSO_4$$

That is, half the copper can be obtained in the metallic state and the other half in the form of sulphate.

On the above principles a new process for the treatment of copper ores has been devised. In this the ore is roasted in such a manner that the whole of the sulphide of copper is transformed into dioxide or sulphate and the whole of the iron into peroxide. Then it is lixiviated by means of a solution of sulphurous acid prepared in the ordinary manner from the fumes given off during the roasting. A saturated solution of cupro-cupric sulphite and sulphate of copper is obtained, containing at the same time a certain proportion of ferrous sulphite and sulphate. The ferric sulphite in the presence of an excess of sulphurous acid is transformed according to the reaction.

$$Fe_2O_3, SO_2+SO_2=FeSO_4+FeSO_3.$$

The saturated solution of the salts of copper and iron is pumped into a copper boiler, where it is heated to 180° C., by which a pressure of 10 kg. is produced. At this temperature the sulphite and the ferrous sulphate are completely insoluble and are precipitated. The cupro-cupric sulphite is dissociated and loses two-thirds of its copper in the metallic state and at the same time sulphate of copper is formed.

The cloudy liquor is forced by its own pressure through a filter-press heated by steam circulating around the plates. In this manner a solution of sulphate of copper is obtained, which can be cemented or treated for crystallized sulphate, and a precipitate containing metallic copper, and sulphite and sulphate of the protoxide. This precipitate is washed with pure water, which becomes saturated with sulphate; the latter may be extracted by crystallization. The residual sulphite is then oxidized by moist air and gives sulphate of the protoxide, which can be eliminated by a fresh washing, and there remains finally metallic copper of great purity, which is melted and run into ingots.

Equipment of the Sultan Mine, Arizona.*

Written for the MINING AND SCIENTIFIC PRESS by CHARLES E. BUNKER, Construction Engineer.

The Sultan mine, operated by the Golden Link M. Co., is located in Yavapai county, Arizona, in nearly a westerly direction from Prescott, and 19 miles from Hillside station, on the Santa Fe, Prescott & Phœnix Railroad. It is on the western slope of the Santa Maria river, in what is recorded the Enreka mining district.

The surface equipment consists of a 20-stamp mill, 75-ton cyanide plant, a pumping station and power house.

All foundations are made of concrete. The retaining wall below the batteries is concrete in the proportions of 285 pounds of Portland cement to four parts of sand and eight of broken rock (by measurement) to the cubic yard. The retaining wall under the ore bin is of the proportions of 380 pounds of cement to the cubic yard—with the proportion of sand and broken rock the same as in the lower wall. The retaining wall back of the power house is in the same proportions as the lower wall.

The battery blocks are solid concrete. The base which extends the entire length of the twenty stamps to the height of the line sills is one solid masonry block, 6 feet deep by 13 feet wide by 31 feet long. On the front side of this base are built the mortar blocks proper, which are 8 feet on the base battering on front and back sides to 4 feet 11 inches on top and 4 feet high. These top blocks were constructed after the battery posts and line sills were in place by building a form between them and tamping it full of concrete. The concrete is mixed in the proportions of 400 pounds of cement to four parts of sand and eight of broken rock (by measurement) to the cubic yard.

The engine foundation is 7 feet deep by 8 feet wide by 25 feet long. The concrete is in the proportion of 285 pounds of cement to the cubic yard, the proportions of sand and gravel being as elsewhere.

The dynamo, air compressor, feed-water heater and feed-water pump are all on concrete foundations. The pillow blocks and floors in and about the plant are concrete, faced with cement. The floors, pump foundations and retaining walls at the cyanide plant are also of solid concrete of about the same proportions as given above.

The battery frame is of the "back-knee" type. The back knees form the line sills on which the ore bin rests. The ore bin is 30 feet long by 16 feet high, by 16 feet wide, with a 45° angle brace in the lower back corner, which supports the floor joist. There are also in each bent a 10x12 45° angle brace in the upper corners of the bin, securely drawn together with 1-inch bolts for the purpose of eliminating the vibration imparted to the structure as far as possible by the rock breaker, which rests on the caps of the bin—an arrangement which is to be condemned in all mill construction wherever possible. In this particular case, it was imperative that the breaker be so placed. The crusher is a 9x15 inch Blake. It weighs ten tons, so it is easily understood what the vibration might be when the crusher is in operation.

The mortars are of the Homestake pattern, and each weighs 6300 pounds. They are narrow and designed for fast crushing. The dimensions in the bottom of the mortars above the false bottoms are 10½x50 inches. At the line of discharge the width is 15 inches.

The stems are of the Allis-Chalmers special mild steel, 3½ inches in diameter by 14 feet 6 inches long, tapered on each end. They are spaced in the mortar with 10-inch centers. The stamps, including stem, tappet, bosshead and new shoe, weigh 1000 pounds.

The two cam shafts are of the best hammered iron, 6 inches in diameter. Each carries ten cams, which are provided with the patent eccentric fastening device of the Blanton type. The cams and tappets are of chrome steel. The order of drop of the stamps is 1, 3, 5, 2, 4, which is not to be recommended in any case, as it tends to cause the pulp to bank in one end of the mortar, thus allowing the stamps in one end of the mortar to "pound iron" while the other end is chocked up, doing little if any work. The order of drop to be universally recommended is 1, 5, 2, 4, 3 in a battery of five, or, in a battery of ten, 1, 6, 5, 10, 2, 7, 4, 9, 3, 8, that is, supposing the stamps to be numbered consecutively from one end in the battery from one to ten.

The rock breaker and cam shafts are driven by rubber belting from pulleys on one main line shaft, which is a continuation of the engine crank shaft. This shaft rests on concrete pillows and the line sills of the battery frame, and is situated directly back of the mortar blocks, under the feeder floor.

The copper plates in front of the mortars are 16 feet long and 5 feet wide, and are plated with two ounces of silver to the square foot. The plates have a grade varying with the length, that is, the plate is sprung to form a gradual decreasing grade. At the head near the mortar the grade is 1¾ inches to the foot. At the lower end the grade is 1½ inches to the foot. The idea of the decrease in grade is that as the natural rate of flow of the pulp is increased it is also retarded by less grade so the flow is maintained at about a constant velocity over the entire length of the plate.

Riveting Solution Tank, Sultan Mine, Arizona.

The clean-up pan is to the right of the north battery and in front of the clean-up room. It is 30 inches in diameter, and provided with an adjustable grinding muller with chrome steel shoes. The clean-up room is provided with hot and cold water, tables and clean-up tub for washing screens and panning sands, also an amalgam safe and quicksilver trap.

The power house is divided into the boiler-room and engine-room. In the boiler-room is a nest of two 60-inch by 16-foot horizontal tubular boilers, each rated at 80 H. P. capacity. The boilers are set in rubble lined throughout with fire brick. Each boiler is fitted to burn oil.

The oil is fed to the boiler at a constant temperature and pressure by a compact and neatly designed fuel oil circulating system. Under one boiler are two burners, with circular orifice. Under the other is one burner with a rectangular orifice. As to the merits of the two burners our limited experience so far has proven the former burner to be superior in many ways.

The boiler feeder is a 5¼x3½x5-inch duplex steam pump supported on a concrete block. The boilers are also provided with a feed water injector. All feed water before entering the boilers passes through a tubular heater, through which all exhaust steam from the Corliss engine, air compressor and feed pump passes. All piping, with the exception of the main 4-inch steam pipe in the boiler room, is laid in conduits below the concrete floor. Either boiler has sufficient capacity to operate the entire plant. With

*See illustrations front page.

this flexibility one boiler is always in reserve.

The engine room contains all of the power motors with the exception of the pumps. The Corliss engine is a 10x16x30-inch tandem compound, built by Allis-Chalmers, and rated at 120 H. P. when running at 106 revolutions per minute. The steam is taken into the high pressure cylinder at 125 pounds pressure and exhausted to the low pressure cylinder at 45 pounds pressure.

The air compressor is a 10x10x12-inch simple slide valve engine, governed by a combined air-steam governor. The compressor is run to carry an air pressure of between forty and seventy pounds for operating the filter presses at the cyanide plant. In the engine room is an electric 50 H. P. dynamo, which runs at 1200 revolutions per minute. It is driven by a 10-inch double leather belt from a countershaft running overhead and above the ceiling. The dynamo furnishes lights and power to operate the electric pumps at the pumping station 1 mile below the power house. The foundations of the engine room, as already stated, are of concrete. All piping and electric wiring are laid below the floor. The floor is paved in diagonally laid squares, with a tiling around the outer edge of the room. The room is ceiled throughout with double-beaded ceiling, and is lighted by four skylights and two double mullion windows.

Mining on Douglas Island, Alaska.*

Written by ROBERT A. KINZIE.

The chutes employed in the Treadwell mines of Alaska are of unusual construction. The cuts show the features of the so-called finger chute which is used throughout the island when a large amount of coarse rock is to be handled. The fingers are held in place by the weight of an arm B and are separately swung from the rod c c, so that the motion of each is independent of that of the other. For the purpose of raising the fingers so that the ore can be drawn, to the top of each finger is fastened a piece of rope. These pieces are brought to a common center and fastened to the main hoisting rope, which passes over a pulley in the top of the drift and thence down to a small windlass. When ore is to be drawn the fingers are raised to the height necessary to allow the ore to pass. When enough ore has been drawn the fingers are released and fall into position, stopping the flow. If a large piece is caught on the lip of the chute it will hold only the finger or fingers that come in contact with it, while the others drop to their normal position. To prevent fine dirt dripping into the roadway, a tailboard is put across the mouth of the chute and held in position by the angle irons D.

The cost of putting up chute raise, cutting station, and installing finger chute complete, is as follows:

Twelve feet of raise at $9 per foot	$108 00
Eighty cars of dirt at 20 cents	16 00
Cutting chute station for windlass	40 00
Forty cars of dirt at 20 cents	8 00
Building finger chute	17 58
Lumber (700 feet, board measure, at $12)	8 75
Iron and steel	40 00
Blacksmith work	7 00
Rope	2 00
Total cost	$247 33

The principal advantages gained by using the finger chutes are dispatch in loading and freedom from blocked chutes and spilling ore on the tracks. Their cost is prohibitive except where a large amount of coarse, dry rock is to be handled, and in the Ready Bullion and Mexican mines they have been in a great measure superseded by the common board chute, which costs much less. In the Treadwell they alone are used, and they are being put in at intervals of 20 and 15 feet, instead of 30 feet, as heretofore. The additional expense of putting in finger chutes every 15 feet, instead of every 30 feet, is $8.33 per foot of drift. The saving in shoveling in a stope 60 feet wide would be $12 per foot, making a saving of $3 67 by additional chutes, to which must be added the advantage of not losing time by chutes getting blocked. With chutes 15 feet apart, the train can move with brief stops and be practically drawing from the same part of the stope. The blocked chute can be freed by one man and not delay the train more than ten minutes. Also, in case the back of the stope should become so bad that men could not get in to work the ore into chutes, more than twice as much could be drawn from the stope with chutes 15 feet apart.

A modification of the finger chute is used for the skip and bin chutes. They are made with six fingers and are 6 inches wider than the ordinary chute. A trough is added to carry the ore from the lip to the edge of the shaft. It is 9 feet long and 3 inches wide, with an inclination of 36°, so that the ore will run freely from the lip to the skip. Attached to the end of the trough is a hinged door made of ¼-inch steel plate. When raised it immediately and entirely stops the flow, and allows the trough to be filled in readiness for loading the next skip. It takes, on an average, twenty seconds to load a four-ton skip and make everything clear for hoisting.

Table I gives the duty of machine drills in the different characters of work for which they are employed.

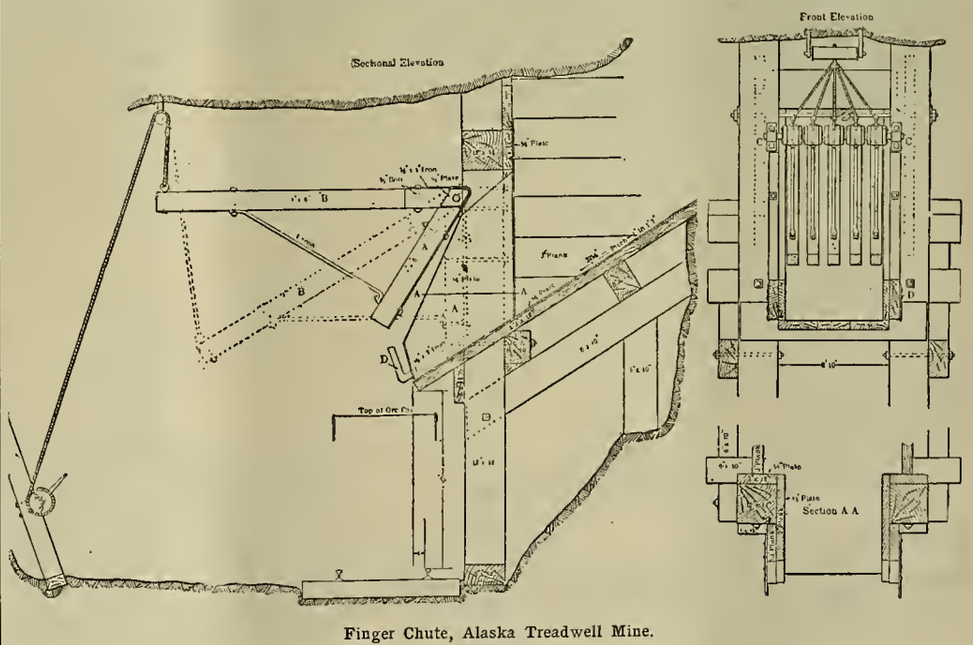
Under the heading "Pounds Powder Used per Machine Drill per Ten-Hour Shift" is given the actual amount of powder used for blasting the holes drilled, but it does not include powder used for bulldozing, blasting chutes, etc. The cost of this powder is given under the head of "Explosives." It varies with the different mines, and from month to month in the same mine, according to the varying expenses of handling and sales of powder to outside parties.

The "Labor-Drilling" cost is given in the actual expense of machine men and helpers. The men do a great deal of the paring down and trimming, and the above cost will vary accordingly.

The last column, "Average Cost per Machine Drill in Ten Hours," gives the cost of drill sharpening, repairs, power, and all other costs not included under the heads of "Labor-Drilling" and "Explosives."

TRAMMING.—At present there are three methods of tramming in use—by hand, with horses, and by endless rope haulage.

When the tramming is done by hand one man loads a car, pushes it to the ore bin, dumps, and returns it to the chute. Ordinarily there are several men tramming from the same chute, and a great deal of time is lost by awaiting their turn to load; and, again, at the bin there is another wait until the last car is dumped before starting on the return trip.



By using horses the lost time is minimized by making up two or more trains of eight cars each, so that when one train is dumping another is loading and the third is on the way.

While there is a marked saving in men by using horses, their first cost is considerable, a horse costing $180 delivered; and their depreciation is another factor to be considered, for they are continually meeting with accidents, which either disable them permanently or lay them off at a cost of $1 a day for maintenance.

By the use of mechanical haulage both the lost time and cost per ton has been greatly reduced. The system is essentially the so-called tail rope system in use in numerous places, but modified to make it conform with underground conditions. On the hanging wall side of the ore bin is situated a double-drum winding engine, size of cylinders 7 inches by 10 inches, with drums 2 feet 8 inches in diameter. Set directly in front of and close to the engine are four posts. Two are designed to carry a sheave suspended on a horizontal axle, for guiding the upper rope and causing it to wind smoothly on the drum, while the remaining two support a roller which answers the same purpose for the lower rope. From the drum to the point where the drifts branch out the upper rope is supported by snatch blocks suspended from the back of the drift and by sheaves at the ends of arms securely fastened to 10x10-inch posts. A horizontal sheave is placed at the point where the direction of the rope is changed to allow it to enter the drift. Since this sheave is subject to severe strains, it should be held rigidly in place by horizontal 10x10-inch pieces securely bolted to the 10x10-inch posts. From this point to the end of the drift the upper rope is carried by sheaves fastened to the posts of the finger chutes, immediately under the protruding lip, where it will be out of the way and at the same time protected from blasting. The sheaves are inclined so that the greatest strain is at right angles to the axles, and the rope prevented from jumping out by pegs placed across the top of the sheave. The lower rope is kept in line by a series of horizontal sheaves fastened to blocks, their number depending on the crookedness of the tunnel; and it is prevented from dragging on the ground by iron rollers placed between the tracks.

The lower sheaves are placed as near the track as possible, and are mounted on pieces of 10x10-inch timber securely braced against the side of the tunnel. To guide the rope into the sheave the front end of the block is beveled off to the height of the rail. On the top of the sheave is a piece of wrought iron, its object being to prevent the rope from jumping out and also to hold the axle in a vertical position. At the ends of the various drifts, or at convenient points in them, is placed a series of sheaves, or a single sheave, as the case may be, to carry the end loop of the rope. At first was tried a sheave mounted on a truck and fastened by clamps to the rails, but this proved a failure on account of the great strain, pulling up the track and doing other damage.

For purposes of signaling, two bare iron wires are run the entire length of the tunnel. These wires are parallel and 4 inches apart. At the winding engine they connect with a bell and signal light, while the current is obtained from the electric light circuit. The signals are given by placing an iron candlestick across the two wires or by means of a special portable signal device. As the wires are bare, signals can be given from any point, which is a great convenience in case of the train jumping the track or other accident. Two trains are used on each level, consisting of seven cars, each car holding 1½ ton. While one train is discharging at the shaft ore bin the other is loading. The trains are run at a maxi-

Finger Chute, Alaska Treadwell Mine.

*Trans. Am. Inst. Min. Engs. (Condensed.)

mum speed of 800 feet per minute, and at present their capacity is 750 tons of ore per shift, or 1500 tons per day.

SAMPLING, MAPS AND ASSAYING.—Close attention is paid to sampling and recording the assay value of the ore. As a drift, raise, crosscut or other development work is in progress, a sample is taken after each round has been blasted. These samples are taken by either the shift boss or the foreman, and their description and location are recorded on a special tag, enclosed with the sample in the sack.

At intervals of 15 feet, and closer if there is any doubt as to the value of the ore, lines of samples—each sample being 10 feet long and varying with the nature of the ore—are taken across the back of the stopes at right angles to the strike. These samples are taken by cutting trenches, usually 10 feet long, 4 inches wide across the strike of the ore, and 5 feet apart, for the entire length of the new work. A hand sample is taken from each car at the ore bins, and again at the crushers a grab sample is taken by means of large dippers, before the ore goes to the mill.

TABLE II.—SHOWING NUMBER AND PERCENTAGE OF DIFFERENT NATIONALITIES WORKING AT THE MINES ON DOUGLAS ISLAND, ALASKA.

Totals	100.0	473	199	152	824

The only samples taken in the mill are from the tailings and sulphurets. The tailings sample is taken either at the tail of the vanners by means of dippers, or at the end of the tailings launders by means of automatic samplers. The sulphurets are sampled by means of the ordinary grooved sampling rod. When the mine sample reaches the assay office it weighs from 50 to 150 pounds.

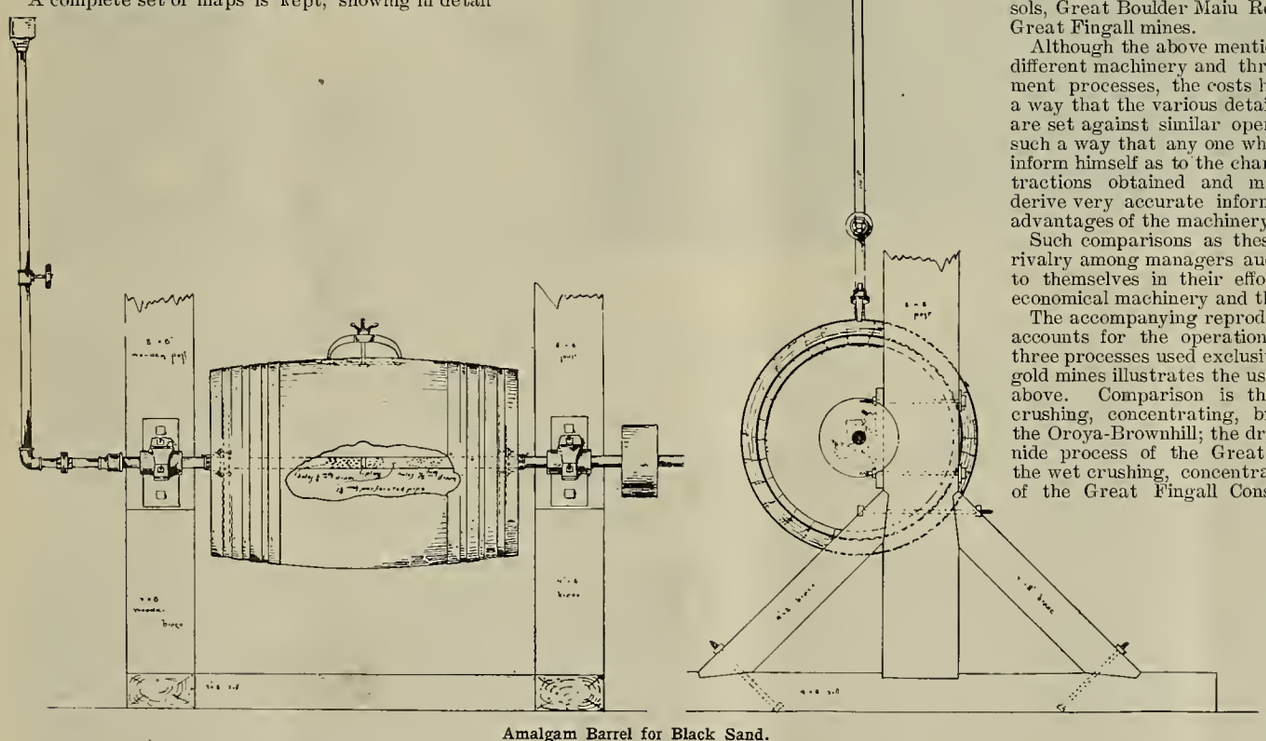
The assay office is fitted with the usual grinding machinery, two double muffle furnaces, pulp and bullion scales, etc. There is an average of about one hundred samples assayed each day, and the returns from a sample are obtained the day after it is taken. All samples are assayed for gold only. In connection with the assay office are the retorting and melting rooms for refining the amalgam from the mills.

A complete set of maps is kept, showing in detail the underground and surface workings of the mines, also the value and position of each sample taken and the quantity of broken ore and reserves.

Topographic Map of Northwestern Montana.

The United States Geological Survey has published a map of the Saypo quadrangle in northwestern Montana, which embraces an area covering 30 minutes of latitude and longitude, extending from 47° 30′ to 48° 00′ latitude and from 112° 30′ to 113° 00′ longitude, and contains 805 square miles.

It lies wholly on the eastern slope of the Continental Divide. The Sun River mountains extend through the central portion from north to south and form the most important topographic feature. These mountains, which are extremely rough, rise from an altitude on the plains to the east of 4650 feet above sea level to 8865 feet in the highest peak. They are composed of a number of small ranges that lie parallel to one another and have a general north-and-south trend. The summits of these short ranges are usually beset with sharp pinnacles, and viewed from a distance present a typical sierra or saw-like appearance, contrasting strongly with the level plains that occupy the eastern third of the quadrangle. Several small streams rise in these mountains and flow eastward to join the Sun river. Here also the Teton river has its source. The valley of Sun river occupies the western part of the quadrangle and separates the Sun River mountains from the main chain of the Rockies, which form in Montana the Continental Divide. Sun river itself rises in the northwest corner of the quadrangle, flows southward almost to the southern boundary, turns abruptly to the east and then cuts through the mountains in a deep, narrow canyon, one of the most picturesque in Montana. There are no settlements in the mountainous portion of the quadrangle, but the eastern plain is occupied by the ranches of sheep and cattle raisers.



The map of the quadrangle is made on the scale of 1:125000, or nearly 2 miles to the inch. The topographic features are represented by contour lines of elevation representing vertical intervals of 100 feet. All roads and trails are shown.

The map is printed in three colors, the waters being in blue, the topographic features in brown, and the cultural features—roads, railroads, towns, etc., and all lettering for names—in black. A full explanation of the topographic methods employed and conventional signs used is printed on the back of each map. The maps can be procured from the Director of the United States Geological Survey, Washington, D. C.

Device for Treating Black Sand.

TO THE EDITOR:—The accompanying sketches are those of an amalgamating barrel which I have used successfully the past five years for cleaning up black sand. It is a great labor saver and easily constructed. Using a piece of 1½-inch pipe for shaft and a 10-gallon keg for an amalgamator, filling the barrel one-third full of black sand, with two pounds of quicksilver, it can be arranged to run by water-wheel set in the sluice box, or independently. The water supply can also be connected the same way. When the barrel turns about fifteen revolutions per minute I have found it to work best. At the belt end of the shaft I always set a small keg or tub to catch any quicksilver that should get out of the barrel. This is not patented.

GEO. W. OTTERSON,
Superintendent Detroit-Alaska H. M. Co.
Seattle, Wash.

Amalgam Barrel for Black Sand.

Uniform Cost Returns.

Written by W. A. PRICHARD.

All good work in mining is the result of an honest desire on the part of a director, engineer or manager to meet surrounding conditions and make the greatest profit out of a mining property.

A mining property, unlike a manufacturing concern, is an exhaustible asset. Every pound unnecessarily expended in development, machinery or working costs on a mine is irretrievably lost to the mining investor. In order to avoid such wasteful expenditure it is necessary to determine with as much precision as possible what is the best machinery for a given purpose, what are the best working methods to employ, and what is the best type of man to place in charge of such machinery and operations. The great multiplicity of machinery and methods employed in mining operations makes such determinations extremely difficult on account of the large number of ingenious men engaged in mining, each with his individual proficiency in certain branches of work. Aggregate working costs differ widely in mines working on similar ores under similar conditions. Comparative analysis of the working costs shows up still wider differences in the cost of certain operations, such as crushing with stamps, concentrating, amalgamating, etc., a perfect understanding of which should be the very A B C of a mining man's education.

Where several mines with similar ores, such as at Kalgoorlie, are working under the same general conditions of labor, supplies, etc., the officials of each individual mine should be afforded every facility for profiting by the mistakes and successes of all others in the district. By systematizing the records of engineering, metallurgical and mining results under a common system, great economy can be introduced in the experiments, methods of working and selection of supplies and machinery. Every mine has its own system of account keeping and reporting to conform with the different ideas and methods of different auditors and managing directors, and although the cost sheets of each mine fulfill all of the requirements of that particular mine, the varying conditions and different processes and methods employed make comparison extremely inconclusive. In order to show up the advantages and defects of different machinery and methods, it is necessary to compute the costs on a common system for comparison. The writer has, to meet this requirement, designed a special cost form. This cost form has, since the beginning of the present year, been used as an auxiliary to the regular cost and extraction sheets at the Lake View Consols, Great Boulder Main Reef, Oroya-Brownhill and Great Fingall mines.

Although the above mentioned mines are employing different machinery and three widely different treatment processes, the costs have been split up in such a way that the various detail operations at one mine are set against similar operations at the others in such a way that any one who is interested enough to inform himself as to the character of ore treated, extractions obtained and machinery employed, can derive very accurate information as to the relative advantages of the machinery, methods and processes.

Such comparisons as these introduce a healthful rivalry among managers and afford great assistance to themselves in their efforts to introduce the most economical machinery and the most skillful employes.

The accompanying reproduction of the expenditure accounts for the operation of three mines by the three processes used exclusively in Western Australia gold mines illustrates the use of the form referred to above. Comparison is therein made of the wet crushing, concentrating, bromo-cyanide process of the Oroya-Brownhill; the dry crushing, roasting cyanide process of the Great Boulder Main Reef, and the wet crushing, concentrating, cyaniding process of the Great Fingall Consolidated, together with their mining and other expenditures for the month of July, 1903.

At the recent conference of the Chamber of Mines at Kalgoorlie, a resolution was passed favoring the adoption of a uniform system of reporting costs. The above information is offered as a possible aid toward that end. The present practice of a few mines in Western Australia of publishing costs monthly has been a wonderful impetus towards improvement in mining.

Uniformity of account keeping is much needed in the matter of separating development from ore extraction and in charging out salaries and management expenses. The writer has instituted at a few mines the system of charging to ore extraction all ore derived from development at the average stoping cost for ore derived from stopes. The accompanying table explains the system: (See next page.)

Shaft Sinking and Equipment at the Ashland Mine.*

Written by H. F. ELLARD.

The sinkiug and eqnipping of modern shafts is ever an interesting featnre of mine work. The location of our No. 6 and No. 7 shafts, as well as their condition in May, 1901, made the sinking of a new shaft at this property at Ironwood, Mich., a necessity. At that time the mine was pnrchased by the Cleveland-Cliffs Iron Co., and this improvement was at once decided npon.

Upon assuming charge of local operations here on June 11 following, the attention of the writer was directed to this feature of the work. After a careful snrvey of general conditions, we commenced, July 15, to explore the foot wall at the location most desirable, and by test pitting and diamond drilling, we determined that the ledge consisted of a layer of qnartzite, almost uniformly 75 feet thick, overlying strong qnartz slates, both cut at different points by dikes of diorite, which in the unaltered form here encountered proved extremely hard material.

The drift consisted of 20 to 25 feet of peat, sand and boulders. The diamond drill cut the measnres at

Arrangement of Shaft, Ashland Mine, Michigan.

right angles from the 1st, 3d, 8th and 10th levels, and proved the foot to dip to the north at an angle of approximately 60° from the horizon; this incline was, therefore, adopted for the shaft. The location selected is a point 155 feet in the foot wall aud immediately south of No. 6 shaft.

It was decided to sink a shaft of considerable capacity, as we wished to have it serve the territory formerly developed by Nos. 5, 6, 7 and 8 shafts. We, therefore, made provision for two skips, a cage and counterweight, a ladderway and pipe compartment. These with sufficient dividers called for a shaft 9 feet 8 inches by 15 feet 8 inches inside dimensions. The ontside dimensions, inclnding laths, reqnired an opening of 12 feet 4 inches by 18 feet 4 inches, but the grounnd actnally broken was generally abont 13 feet by 19 feet, displacing 247 cnbic feet, or twenty tons of rock per foot of sinking.

The sizes of the compartments, as shown in the accompanying cnt, are as follows:

Cage compartments, 5 feet by 9 feet 8 inches.

Two-skip compartments, each 4 feet 8 inches by 5 feet 8 inches.

Counterweight compartment, 1 foot 8 inches by 2 feet 8 inches.

Ladderway, 2 feet 6 inches by 2 feet 8 inches.

Pipe compartment, 2 feet 8 inches by 4 feet 4 inches; all inside dimensions.

The timbers used are as follows:

Wall plates and end pieces, 14x14 inches; white pine.

Cage divider, 10x12 inches; tamarack.

Divider for foot of skip compartment, 10x12 inches; tamarack; all other dividers, 6x12 inches, tamarack.

Cage runners, 5x8 iuches, and skip rnnners, 6x7 inches; Norway pine.

Stnddles, 12x12 inches; white pine.

To give additional stability to the divider carrying the skip roads without dovetailing it into the end pieces a studdle of 4x12 inches, tamarack, was added between this divider and the foot-wall plate. The other end of this divider was dovetailed 1 inch into the cage divider, and, in addition to this, is strengthened by the 6x12 inch dividers between the counterweight and ladder compartments. The size of the wall plates and end pieces was reduced to 12x12 inches when the shaft had reached a point in the ledge where the ground was considered sufficiently strong to warrant this. The laths are 2-inch hemlock on the ends and foot wall sides; on the hanging side 2-iuch tamarack was used almost exclnsively. A 3-inch tamarack floor was placed between the rails of the skip roads, and 45-ponnd rails were used for the skips and cage. A casing of 2-inch plank on the skip side separates the cage aud skip compartments. The sets were spaced irregularly. This was dne to the nature of the material, which at the surface was very reacherous, and farther down became very hard and strong. The hangers are of 1¼-inch common iron.

The design as adopted proved very practicable, and the only feature that has not met with universal approval, and abont which any misgivings were entertained at first, is the placing of the skips in the hanging. This, it was argued, would place an excessive load on the dividers carrying the skip roads, and also tend to weaken the constrnction at a time when the timbers would begin to decay. While recognizing the force of these objections, we maintain that with reasonably heavy rails the burden of snpporting the skips and the skip roads on a 60° angle is comparatively slight, and the opportunities for reinforcing or renewing any of these dividers are snch that the entire work could be done without causing the skips any delay whatever. The design lends itself admirably to the convenient and rapid handling of ore and timbers, and the pipes rest upon the foot wall fully protected from jar or strain.

ORE POCKETS.—On each main level two small pockets, each holding one skip load, are constrncted immediately in front of the skips, and into these the ore is dumped by means of self-acting tipples. A lever conveniently located is connected to a slide door, consisting of steel plate ½ inch by 2 feet 4 inches by 3 feet, and this is readily raised by the skip tender when the skip is in position for loading. The incline of the shaft brings the skip directly underneath the doors, and no waste whatever occnrs in loading.

EQUIPMENT.—Pnmp stations were cnt on the seventh and tenth levels, and two pumps installed in each. All these are compound dnplex pumps and provide a direct and relay reserve plant from the tenth level to the snrface. We are now installing a new triple duplex pnmp on the thirteenth level, and have added a pair of high-pressnre boilers for this work.

As a precaution toward insurance against fires, as well as to preserve the shaft timbers, a system of perforated pipes and galvanized iron baffle plates was placed in the hanging side, by which means a very small amount of water in continnons flow keeps the shaft timbers in a thoroughly saturated condition at all times.

The skips are of ordinary type for inclined shafts. They are of 72 cubic feet capacity, and equipped with single tread front aud double tread rear wheels 12 inches in diameter, of manganese steel, pressed on to 3-inch cold rolled steel axles, running in self-oiling babbitted boxes.

The cage is, we think, unique in some of its features, and was designed especially for this shaft. It travels on a track of 4 feet 3 inches gange on the foot-wall end of the compartment, and consists of a crosshead, to which are attached safety clntches, sills and hangers, carrying the wheels, axles, shoes, floors, etc. There are two floors, 6 feet 6 inches apart, supported in horizontal positions betweeu the hangers. Each floor is 10 feet 8 inches long and 4 feet wide in the clear, and the lower one carries a track of 1 foot 10 inch gauge, conforming to our mine and surface timber tracks. It is also fitted with a device for locking cars and trncks in place while on the cage. This is operated by either of two levers on the foot and hanging ends, respectively, of the cage floor. Gnards serve to keep the men in place while riding on this floor.

The upper floor will be similarly fitted in time, but with the engines now employed for handling the cage it is not deemed advisable to nse both floors for loads. It is sometimes very couvenient, however, to hoist rock or ore on this floor, and in snch case the mine car is pushed off the cage and dumped into the rock chute or either of the ore bins, as desired.

All timbers np to 10 feet in length are handled on small trncks, pushed into the cage from the foot wall side. These are loaded in the timber yard and nsed to carry the timber throngh the drifts on the levels without rehandling. Longer lengths of timber are swung by a crane, and lowered endwise throngh the npper floor of the cage to rest on the lower. The crane is also nsed to place the skips on and off the skip roads.

A length of 7 feet on each floor is available for men and this furnishes standing room for twenty-five to twenty-seven men.

The shoes run on 5x8-inch Norway pine guides, placed 4 feet 10 inches from the foot wall. These serve as back rails for the cage wheels.

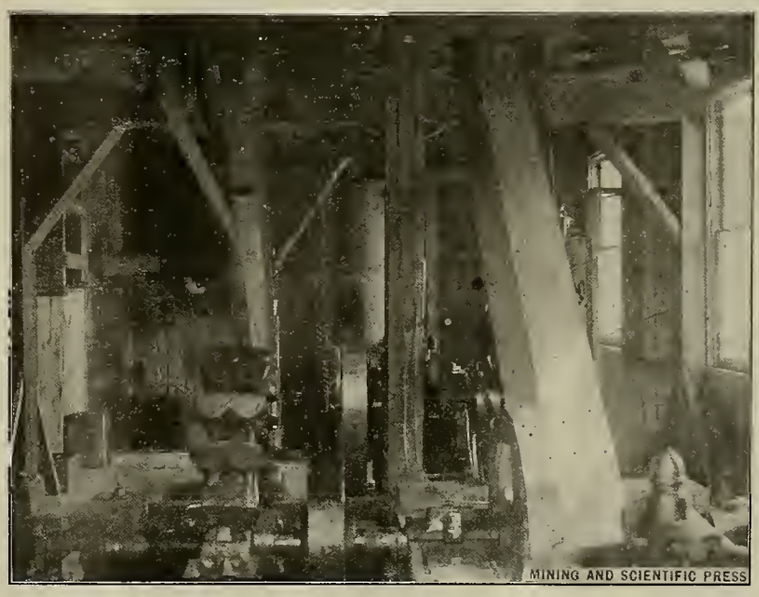
The safety clutches are attached to the crosshead, and also run on these guides, and are depended npon to effectually prevent a rnnaway of the cage, should an accident occnr to the hoisting cable.

The wheels are of manganese steel, 16 inches in diameter, pressed ou to 3-inch cold rolled steel axles, rnnning in self-oiling babbitted boxes. The lower wheels are placed below the floor and braces run from the sills at this point to the hanging end of the floor to add greater strength to the floor supports at this end, and also to thoroughly brace the entire lower frame work.

The weight of the cage, with wheels and axles, is slightly over two tons.

HEAD FRAME.—The head frame was erected by the Wisconsin Bridge & Iron Co., Milwankee, Wis. It is of steel and of simple design. It contains two small ore bins, with a combined capacity of 100 tons, fitted with pocket stops of the style as described in Volume II of the "Proceedings" of this institnte by Mr. Wm. Kelly. To this we add a slight improvement, which enables the brakeman to operate the stop without leaving the railroad car. It consists of bending the handle or lever and attaching thereto a supplementary handle, which, in our case, is nothing more than a canthook stock. This hangs loosely over the car, within easy reach of the brakeman.

The landing platform is 42 feet above the ground, and the openings to the ore bins are opposite the skips. Small steel chutes carry the ore forward to discharge into these bins, and the grading is doue by a special grading truck, which travels crosswise under the chutes and deflects the ore to one side or the other as is desired. It also throws the rock from the skip to the side of the ore bins into a chute, which carries it to a rock car on a trestle 17 feet below the landing platform.



Some of the featnres of the landing platform are as follows: Either grade of ore may be hoisted with both skips and the cage, and dnmped into either of the ore bins or the stockpile car, as desired. Rock may be hoisted with one skip and the cage. When shipping and stockpiling are carried on simultaneously, both grades of ore may be hoisted for both pnrposes with both skips and the cage. All the work of this landing, including the grading of ores, the giving of signals and the tramming of rock, is done by one lander. The rock is handled by an antomatic side-dumping car, propelled by a small winze hoist, to which reversing gear was added. It is operated by the lander.

(TO BE CONTINUED.)

*Trans. Lake Superior Mining Institute.

Equipment of the Garnet Mine, Pony, Mont.

The Garnet M. Co.'s new power plant at Pony, Mont., has recently been installed. It comprises a 3-foot Pelton wheel, operated under 100 feet pressure, with two balance wheels and a hood for regulating, with a Replogle sectroidal governor. To the same pulley, on the countershaft, is belted a Weber special 5 H. P. gasoline engine, with battery, tnbe and gas engine igniter. The engine and wheel may be run together if desired. From the countershaft

Power Station, Garnet Mine, Pony, Mont.

is driven a 6 H. P. dynamo, with switchboard for meters, power and light connections; and a 30-inch blower with 8-inch run-around for blast or suction, with connections to the forge. All parts of all machines are readily accessible, with enough room about all of them. The building is 12x28. The wheel or engine will run three Durkee electric drills; one is now in use. The plant is compact, convenient and nearly automatic.

The accompanying illustration shows the interior of the power station. Work is progressing on the tunnel at the Garnet, a contract having recently been let. E. L. Ballou is manager.

Mining and Metallurgical Patents.

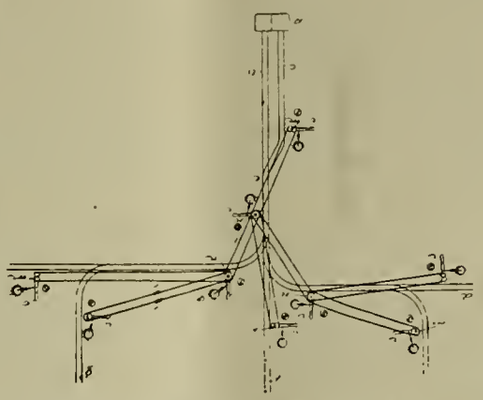
PATENTS ISSUED NOVEMBER 3, 1903.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

MINE TIMBERING APPARATUS.—No. 742,437; J. R. Hunter, Wilkesbarre, Pa.

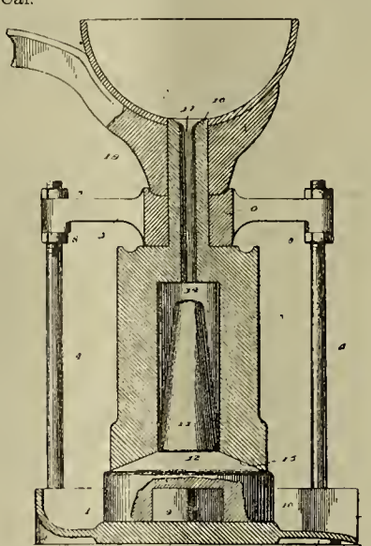
Supporting frame, load-supporting carriage movable longitudinally of frame, drum mounted for rotation upon frame transversely of carriage, hoisting cable between carriage and drum, and means for actuating drum and operating thereon parallel to path of carriage.

CONCENTRATOR.—No. 742,889; J. J. Montgomery, Santa Clara, Cal.



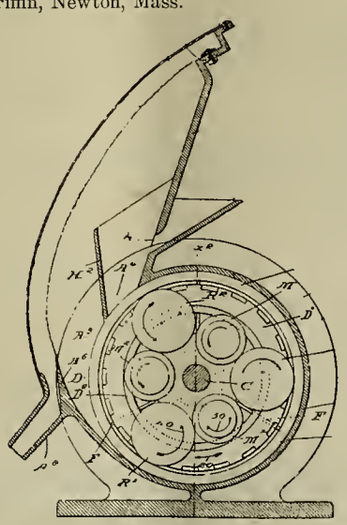
In concentrator, combination of concentrating table, means for vibrating table in direction of travel of material thereon, means for supplying material to one end of table, supports for table inclined to its surface at angle against direction of travel of material thereon, spring to compensate downward pull of gravity on table, discharges for tailings through table at points throughout its length, and discharges for concentrates at end of table opposite to that at which material is supplied.

METALLURGICAL PROCESS.—No. 742,830; O. W. Brown, Bloomington, and W. F. Oesterle, Marion, Ind.



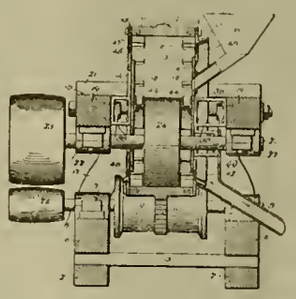
The proeess of simultaneously producing metallic zinc and carbide by mixing with zinc ore, carbon and oxide of a metal having greater affinity for carbon than for zinc, and heating mixture to temperature sufficient to produce products.

SIGNAL SYSTEM FOR MINES.—No. 742,962; N. K. Bowman, North Lawrence, Ohio.



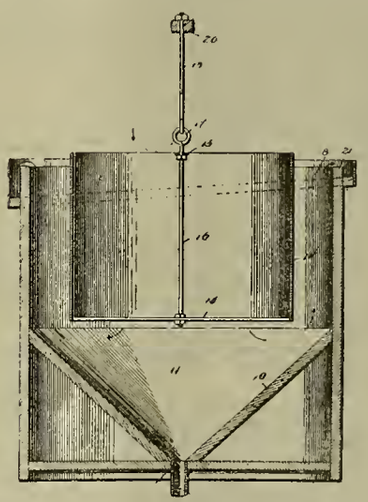
In signaling system for mines, combination with plurality of branch tracks running in different directions and connecting at different points and leading into main track, of levers located at several junctions and constituting visual signals and operating handles for system and adapted to be manually operated to indicate by their position safety or danger, and connections between levers to cause them to operate in unison, some of connections leading from intermediate station to several of stations.

QUARTZ MILL.—No. 742,966; J. Y. Byers, Descanso, Cal.



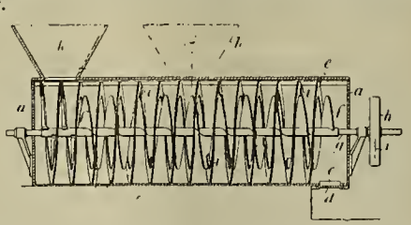
In quartz mill, combination with base having non-circular projection, of grinding member supported detachably upon base and having lower end expanded to form pulverizing surface, and provided in under side with non-circular recess extending into expanded portion and adapted to engage non-circular projection of base to retain grinding member fixedly in position upon latter.

CRUSHING AND PULVERIZING MILL.—No. 742,982; E. C. Griffin, Newton, Mass.



In pulverizing mill, co-operating fixed and rotatable annular dies, and pair of operatively contacting crushing rolls to travel upon dies, operation of rotatable die imparting planetary rolling motion to rolls.

MILL FOR CRUSHING ORES.—No. 743,014; A. B. Mouck, Fargo, N. D.



In crushing and pulverizing mill combination of drum having side plates with central openings, one of plates having flared annular flange on outer side, means to support and rotate drum, muller roller disposed in drum and having movable bearings, plates carried by bearings and forming closures for openings, feed hopper carried by one of plates, and discharge hopper also carried by same plate and having opening in its inner side edge of which is covered by flange.

ORE SLIME SETTLING AND CLASSIFYING APPARATUS.—No. 743,201; F. W. Sherman, Park City, Utah.

In settling apparatus, cylindrical tank having open top and conical bottom with settlings opening at lowest point of bottom, open ended cylindrical feed tube arranged concentrically within tank with lower open end terminated short of conical bottom of tank and upper open end projected above top of tank, area of feed tube being equal to that of annular space between feed tube and tank, cross bars at top and bottom of feed tube, central rod connecting cross bars, and hanger connected to upper end of rod to suspend tube within tank.

APPARATUS FOR MIXING MINERAL OR OTHER DRY SUBSTANCES.—No. 743,202; C. W. Speirs, London, Eng.

In apparatus for mixing substances, combination with stationary horizontal inclosing casing, of horizontal shaft extending therethrough and rotatable therein, two oppositely pitched spiral feeding devices secured to and rotating with shaft, one of devices having external diameter within internal diameter of other throughout its entire length, spiral feeding device of smaller diameter having greater pitch than outer and larger spiral.

A THIN selvage of clay between rock walls will act as an impervious dam and hold back a large volume of water if the enclosing rocks remain undisturbed. Two mines situated on the same vein, which have been intersected by a dike, may operate without the drainage of one effecting the other, so long as the dike remains undisturbed, but, when broken through, it places them upon a common drainage level.

Mining Summary.

SPECIALLY COMPILED AND REPORTED FOR THE MINING AND SCIENTIFIC PRESS.

ALASKA.

At the Alaska-Perseverance M. Co. mines in Silver Bew hasin, near Juneau, Superintendent Pearce says the Alexander tunnel is in 2400 feet. It is 8 feet wide and 7 feet high. The tunnel is a cresscut and is in ere.

ARIZONA.

Cochise County.

L. C. Shattuck ef Bisbee, part owner of the Rincen M. Co., reperts a hody ef copper ore struck in the tunnel on the Rincon mine, 22 miles north of Bensen. The tunnel is heing driven at 130 feet below the surface.

Maricopa County.

The Ben Hur M. Ce. has been reorganized at Phœnix and the directors are H. P. DeMund, W. Talhet, G. B. Richmend, W. H. Battin aud N. Oshorn. J. Oshorn is superintendent. Development work will he increased on the Ben Hur mine, which is 35 miles nerth ef Phœnix, in Cave Creek district. Tho porphyry-quartzite formation is cut hy a ledge which carries free gold. The discovery shaft shows 4 feet of ore which averages $10 per ton. At the meuth of the tunnel is a favorable millsite. The tunnel, 300 feet helow the apex, is in 100 feet.

Graham County.

The Shannon Co., near Clifton, reports continuing to treat 550 tons of ore daily, 250 tons of which goes through its concentrators. Fifteen tons of metallic copper is the company's daily output. On this hasis the ore is yielding 2.78% copper and the company is producing at the rate of approximately 11,000,000 pounds of copper annually. It is stated that Shannon copper is being made and laid down in New York at a gross cest of 8½ cents per pound.

Mohave County.

A half interest in the Kenney-Lapping claim, adjoining the Century mine on the south, near Chloride, has been sold to L. Lapping. The principal vein on the claim is said to he an extension of both the Century and Brunswick properties on the north, which carry veins of ore in silver, gold and copper. Development will he increased.

Pima County.

The Producer M. & S. Co. at Brownell, near Quijotoa, expects to have its 50-ton smelter completed this month. There has been cousiderable work done on these mines, the deepest shaft heing 200 feet. The ore is of copper, carrying silver and gold. There are thirty-five men at work. ——Tho Wolden G. & C. Co. en Quijotoa mountain will put men to work. A hoist is to he erected and the 200-foot shaft sunk to 500 feet. J. W. Gidding is superintendent.

Pinal County.

On the San Carlos strip, 10 miles ahove Dudleyville, the property of the San Carlos C. Co. has been honded hy the Saddle Mountain M. Ce., ef which G. B. Chittenden is manager. Development work is under way. A shaft on the Apachia claim, 120 feet deep, is in sulphide ore, and a tunnel on the Cannon Ball claim ef the O'Brion group has heen driven 180 feet and 150 feet of this shows sulphides.

Santa Cruz County.

The Apache mines at Salero are heing opened up again hy R. R. Richardson. He reports having sixty tons of ore ready for concentratien.

The Tres Amigos mill at Oro Blanco has been completed and will be started up this week. A. Lamb is superintendent.

At Oro Blanco the Old Glory mine has shut down temporarily, says Superintendent Baker. —— At the Golden Eagle (or McDonald mines), Superintendent Code says they will not use the Montana mill which was leased, but will buy a new mill. Development work is progressing.

Yavapal County.

An air cempressor has been put into the tunnel of the Cleveland mine, in Ora Bella district, 10 miles south of Prescott, to furnish air to the engines used to boist ore from the Grey Eagle shaft. Formerly there was a gaseline engine there, but it vitiated the air. The Cleveland mine is owned by P. Kearney of Prescott.

E. D. Seaton, owner of the Cumberland group, uear Prescott, has started operations. A gallows-frame will be built and the mill started, after heing repaired.

J. R. Liston, superintendent of the Wild Flower group of mines in the Bradshaw mountains, southeast of Prescott, says the Wild Flower group is composed of nineteen claims and is sinking a deuble-compartment shaft which will furnish an opening fer working twelve ef the claims. This shaft is dewn 130 feet. At 110 feet a cresscut was run on the ledge, opeuing up a bedy ef sulphuret ere 7 feet wide, which averages $10 geld per teu, hesides carrying copper and lead.

B. J. McDonald et al. are working the Mark Twain mine, near Prescott, and report having on the dump 800 tons of geld-

Near Mayer there are forty men at werk in the Bighug enyx quarries.——At the Hidden Treasure mine, near Prescott, grading for the 10-stamp mill and other reduction works has heen completed.

It is expected the Iron King smelter, near Jereme, will he hlown in hy Dec. 1st. There are sixty men at work at the mine, which numher will he increased to 100 when the smelter is in eperatien.

silver ore which carries $20 per ten. The pay ore is 6 feet in width. The Mark Twain is an extension of the Blue Dick. ——The Ora Bella mill is shut down temporarily to replace the hattery blocks. As seen as finished, work will hegin on the erection of an additional 10-stamp mill.

At the Oro Grande mine, in Black Rock district, near the Maricopa county line, near Wickenhurg, the 5-stamp mill is in eperation. Manager Upton prepeses building a larger plant.——It is reperted the Button mine at Minnehaha will he re-opened.

At the White mine, north of Wickenhurg, near the Maricopa county line, adjoining the Oro Grande mine on the east, work will be resumed, having been suspended during the summer.

The Mohawk M. & M. Co., which has heen working the Roach group on Pine creek, near Prescott, under bond, last week toek over the same, making final payment.

CALIFORNIA.

Amador County.

At the Bunker Hill mine, near Amador City, the mill in course of construction is covered, and machinery is heing put in place. Sinking has been resumed in the shaft.

At the Fremont Con. mine, 1 mile north of Amador City, forty stamps are dropping steadily in the mill, crushing five tens to the stamp per twenty-four hours, says Manager A. Goodell. The ore is coming from the Fremont ground, from the 600 to the 1000 foot levels. The sulphurots that have been shipped have yielded $120 per ton.——The Gover mine is not yet sending any ore to the mill, though ore hodies are being opened up.

At the Bay State mine, north of Plymouth, the additional 200 feet of sinking, from the 850-feot to the 1050-foot level has been completed and Superintendent Worthing will run a crosscut to the vein. The sinking has been doue with machine drills and three shifts of twe men each have made as much as 64 feet in a month, says the Amader Dispatch.

At the Shenandoah mine, uorth of Plymouth, Superintendent Thornton has men at work running a diamond drill to the west to prospect this formation.

The mill at the Pocahentas mine, near Drytown, is in operation. A shoot of ore with gold values is reported struck in the Pocahontas, running north, at 200 feet from the surface.

Calaveras County.

The Hercules-Horseshoe M. Co. has hought the California quartz mine in Indian Creek district, between Angels and San Andreas. Superintendent Shetling of the Hercules-Horseshee Co. has the 2-stamp mill, near Murphys, running steadily.

F. A. Mitchler has mon at work on the Last Chance mine west of Murphys and sinking is progressing. The mine is near the Buckhorn group, which will be re-opened. The Buckhorn group consists of the Red Gold, Buckhorn, O. K. and Christmas mines.

The Garihaldi placer claim on South fork of the Calaveras river has been leased to F. J. Juchter of San Francisco, and development work will be increased. The claim adjoins the Presten-Donovan placer mine.

The Johnston hydraulic mine on Willow creek, 2 miles from San Andreas, was sold last week at public auction to C. V. Gottschalk fer $3200.

S. T. Allen has honded the Veith and Pellaton placer mines, 1 mile south of Mokolumne Hill, for two years for $20,000. The hond also guarantees certain rights in the Lamphear quartz mine. Work will hegin this month.——The What Cheer mine, which has heen closed down for a month past, resumed operations last week.

D. Fricot has bought the Wade Johnson placer mine, southeast of San Andreas, with tail race and right of way fer tailings, also ditch, known as the Pope ditch, the Mammoth, Yaqui Camp, Alaska, Klondike and Seven Up quartz mines on said Johnson placer mine.

Del Norte County.

Manager J. S. Crawferd, with headquarters at Grants Pass, Or., reports increasing development work on the Cleepatra greup of copper mines on Diamend creek. Additional machinery and other equipment will he put in.

El Dorado County.

J. A. Parker, manager ef the New Highland G. & C. M. Co., says they will hegin operations on the Silva gold quartz mine at Georgetown this week.

At Kelsey Superintendent Dunten began eperatiens with the slate cable conveyer last week. Heretefere the slate produced at the Eureka slate quarry has heen hauled to Placerville hy team at a cost of 75 cents a square. By means of the cable slate will he transported to Placerville at a cest of 6 to 7 cents a square. The tramway is supported hy nineteen wooden frame towers and cresses the river at au elevatien of 500 feet, with a span of 2400 feet. It is eperated from the 13-foot water wheel at the quarry power house, and requires 6 H. P. empty and 20 H. P. with the buckets leaded. During the past year at the Eureka slate quarry several additional buildings have heen put up and an air compresser, electric lighting plant and 7000 feet ef power pipe line have heen huilt. In the pit they are 80 feet in depth and an acre in area. A tunnel has heen driven 1000 feet, opening into the bottom of the pit, for drainage, and will preveut the pit filling up as it did last winter. The quarry will be extended north and west. There are 115 men working at the quarry and an average of 40 squares a day is the output. This will be increased till the output is 100 squares (ahout thirty tons) a day.

Kern County.

The Butte mine, near Randshurg, is in operation with non-union men, says Superintendent McMahon.

B. Ostick has bought the remaining one-third interest of J. G. Porter in the Rainbow and Tipton claims near Randsburg.

The Queen Esther mill at Mojave is shut down on account of tho breaking of some of the machinery.——J. Gerner, superintendent of the Karma M. Co., says the mill will be in operation this month.

The Southern Pacific Railroad Co. has bought tho entire holdings of the Reed Crude Oil Co. and the San Joaquin Oil Co. operating in Kern county, and also the stock of the Bear Flag Oil Co.

The Nevada County Oil Co. has completed its well, No. 14, near Bakersfield. —— The Junction Oil Co. has completed another well on its property in the Kern river field, which is said te yield 200 barrels per day.——The Lackawanna is down 700 feet with its well No. 1 and has the water shut eff. They aro putting in a battery of four 80 H. P. hoilers.

Mariposa County.

Operations will be resumed at the Champion mine near Mariposa.

President L. J. Perhacs of the American Eagle G. M. Co., operating the Marble Springs mine, near Kinsley, east of Coulterville, says devolopment work will be increased. Additional huildings are going up.

Nevada County.

Manager Pusheck, from Chicago, Ill., says he will start up the Mountain Maid mine, near Grass Valley, next week.

Manager Root, of the New York-Pennsylvania mine, has bonded the Seven Thirty and Bowery claims, near Grass Valley, and renamed them the Hidden Treasure and Eclipse, respectively. He will put in machinery and start development work. The machinery will include a hoisting and pumping plant, compressor, etc. Plans have been completed to sink 300 feet helow the present shaft, which is down 180 feet. Steam power will he used, with crude oil as fuel.

It is reported that operations will be resumed at the Mountaineer mine, near Nevada City. J. Bender of Ohio, one of the principal owners, is on the ground.

Several stockholders of the Murchie mine, near Nevada City, have bonded the Ethel quartz mine in Washington district, 1½ mile from the Gaston Ridge mine. They have begun drifting on the ledge, opened a crosscut tunnel in 800 feet and will raise to the shaft, which is 110 feot deep, giving a total depth to the shaft of 300 feet. The ledge is 18 inches wide and averages $13 a ton. As seon as connections are made it is proposed to huild a 5-stamp mill.

At the Canfield gravel mine, in Blue Tent district, near Nevada City, men are at work building a 20-stamp mill, says Superintendent C. Graham. He expects to have the stamps dropping on gravel by Jan. 1. The tunnel is heing driven into the hill to tap the channel. Twelve men are working in the tunnel, which is in 700 feet, and it is estimated that 300 feet more will have to he run.

The plant at the Phelps Hill Dev. Co.'s group at Phelps Hill, near Grass Valley, was put in operation last week, says Manager C. A. Poage.

The centrifugal dredging pu mp fer he Brophy claim en Shady creek, near Nevada City, is on the ground. Twenty men are at work, under Superintendent C. L. Miller, building the flume and sluices and putting in pipe.

At the Heme quartz mine, on Deer creek, helow Nevada City, Superintendent D. J. McFall reports several surface imprevements made. The main huilding has heen remodeled and the heisting, pumping and milling machinery increased. The incline shaft is dewn 750 feet. There are two ledges in the claim, one ef them showing a thickness of 8 feet. The 30-stamp mill is running steadily.

The Conlon G. M. Co. has heen incorporated hy G. Beebe, P. Sickles, W. A. Chittenden, O. W. Becker and J. Risk, with principal place of husiness in San Francisce, te operate the Conlon mine near Grass Valley.

Placer County.

(Special Correspendence).—The production ef the Lost Emigrant quartz mine, at Canada Hill, to date, including two carloads ef ore shipped to the Selhy smelter and four months' run with a 2-stamp mill, is $20,486.21. The mine is owned hy F. L. Heath, J. Goulden, S. Jacohs et al. of Colfax, the first-named heing superintendent.

Colfax, Nov. 11.

The Bonnie Bee mine, near Dutch Flat, will reduce its working force this winter, says the Auhurn Repuhlican. The directors will wait until spring before making proposed mill improvements.

There are thirty men at work at the Gaylord gravel mine, near Auburn, the mill being in steady operation.

The Beulder mine, at Ophir, started up last week. They are overhauling the mill and hoist, says Superintendent Swears, formerly of Sheridan. They expect to work machine drills.——Tho Eureka-Hathaway mine has heen bonded to J. B. Truman et al., of Woodland.

Plumas County.

(Special Correspondence). — The 15-stamp mill of the Plumas G. M. Co., 2 miles from Greenville, has been completed and is expected to bo in operation this week. The mill is equipped with batteries of three stamps each (1000 pounds weight) and triple-discharge. The silver-plated amalgamating plates are 4x12 feet. The mill has five concentrating tahles. The ore bins have capacity of 1100 tons. An electric motor will haul ten ore cars in train from the main tunnol of the mine, power and light being furnished by a 37½ kilowatt generator. A 10-ton agitating cyanide plant is on the ground, to be used in treatment of concentratos. W. D. Lawton is manager.

Greenville, Nov. 10.

The Needed Wealth M. Co. has heen incorporated, with principal office at Carson, Nev., by J. A. Bassity, T. P. Fenton, G. F. Greon, C. H. E. Hardin, J. B. Martin and J. L. Moose of San Francisco, to develop and work the Pat Maloy quartz mine near Bucks Ranch, near Quincy.

A. E. Shiun, superintendent of the Bluff City mine, says he has bought the quartz mill on the Bell mining property north of Quincy, and will remove it and set it up at the Bluff City mine. Excavations are being made for the foundations. Beside the 10-stamp mill, the sale includes the 45 H. P. hoiler and engine.

Reperts from Granite Basin, near Quincy, say a new 10-stamp mill will be built on the See and Jolly mines.——The North America mine, near Quincy, says Superintendent E. G. Squier, is being put in order for next spring's piping, building restraining dams, etc.——The Union mine, owned hy the Tabor G. M. Co., will begin operations as soon as sufficient timber can he obtained.

The Five Bears M. Co. is preparing for development of their property on Centennial Hill, near Quincy. At the Genesee (or Gruss) mine the crushing of ore is confined to five stamps on account of the scarcity of water. As soon as sufficient water can he obtained all ten stamps will he dropped.

A consolidation of all the claims on Cooper Hill, near Genesee, has been effected, including the Green ledge, Pilet, Lodi, Barney Tutt mine, Daisy Bell and the Italia. The claims are said to be so situated that one main crosscut tunnel will tap thom all at dopth. Timber and water are available.

San Bernardino County.

The Giant Ledge G. & C. Co., whese properties are in the New York mountains, near Manvel, is having a route surveyed for an aerial tramway frem its mines to the railway at a point 29 miles from Blake.

Santa Barbara County.

The Elliott Oil Co., after several months of trying to sink a well with a retary drill

on the W. Rice place in Cat canyon, near Santa Barbara, has decided to give up the project, and Manager Elliott will put in a standard rig, says the Oil Reporter.

Sierra County.

J. McCarty, W. H. Corbiere, H. J. Wilder and A. Burgan formed a company to develop the mineral prospects on the McCarty ranch on the South Fork, 3 miles from Downieville, last week, and will run a tunnel to prospect the gravel which is said to exist there.

At the Columbia drift mine, 8 miles above Forest City, work on the tunnel will be resumed.——The San Jose company that has taken hold of the Young America mine will begin development work next week.——A shaft is being sunk on the Diadem mine, near Forest City, and ore has been found. It is a contact formation, says Manager J. M. Harper.

Siskiyou County.

Machinery for a 5-stamp mill is on the ground at Humbug, near Yreka, for the McKinley mine. Water power will be used.

Tuolumne County.

The Prudhomme M. Co. has been reorganized and operations will be increased in the spring, says the Independent, when it is intended to add five stamps to the mill. F. Prudhomme has given an option to the Prudhomme M. Co. on the Prudhomme quartz mine, near Carters, for $4000; 25% of the gross proceeds from ore milled are to be paid to Prudhomme, who is superintendent.

F. Danford of Los Angeles has bought the eastern extension of the Galena quartz mine, near Groveland, for $7000. Danford has also bought the Tuolumne Chief quartz mine (formerly the Boxer claim) and has a bond on the Galena claim for the Tuolumne Chief Con. G. M. Co.

The Big Casino M. Co., operating near Groveland, is putting the hoisting engine in place. The gallows-frame is up and the boiler set. The roller mill is on the ground. Superintendent O'Brien expects to resume full operations by Nov. 25th.

At the Mt. Jefforson mine at Groveland twenty stamps are dropping steadily on ore from the 100-foot and 500-foot levels.——The Longfellow M. Co. is putting in a 5-stamp mill. The water is being pumped out of the Longfellow shaft.——At the Providence mine, near Carters, forty men are at work. This week sinking will be resumed at a depth of 1164 feet in the incline shaft. It will go down 150 feet additional.

A. M. Divoll, for $10,000, has bought the Hiyahpoo quartz claim 4½ miles northeast of Columbia.——N. C. Merrill of Denver has bought a half interest in the Eva quartz mine, near Columbia.

The Carlotta and Pennsylvania mines, near Carters, have resumed operations under the management of J. C. Woods. Denver, Colo., men are interested.

The mill at the Vine Spring mine, near Columbia, will be enlarged and five stamps added. A cyanide plant, an assay office and boarding house are being built, says the Independent.

F. Danford of Los Angeles has bonded the Mt. Zion quartz mine, east of Groveland, for eighteen months. Operations will begin next week, says the Prospector.

It is reported that operations will be resumed at the Kanaka mine, near Groveland. Superintendent De Sallier is arranging to put men to work.

Summerville and Soulshyvillo union miners are reported to have run the Chinese out of the Black Oak mine and the town of Soulsbyville. The Black Oak mine at Soulsbyville was shut down on the 10th inst. as a result. Trouble has been brewing for some time on account of the employment of Chinese as ore sorters. About 150 miners went to the mine and demanded that Superintendent W. G. Scott agree to employ no more Chinese. He refused to accedo to their demand. The delegation then escorted the Chinese out of the camp, taking them to Sonora. The mine owners are determined to keep the mine shut down for an indefinite period.

Yuba County.

Barrier No. 2 on the Yuba river, below Smartsville, has been completed and the work will be officially inspected next week. The contractors have had 100 men employed, besides a number of teams. The work of opening a stone quarry for Barrier No. 1 is under way.

COLORADO.

A strike is on in the coal mines of Colorado, 10,000 men having gone out on the 9th inst. by order of the United Mine Workers of America. Of the idle men 6000 are in the southern coal fields, 2000 in the northern coal fields and 1800 in Fremont county. One hundrod mines have been closed. A few independent properties in the northern fields and elsewhere will not stop work, since the operators have agreed to concede the eight-hour day and also increase wages. Reports of the 11th say independent coal mines are one by one making terms with the strikers which is expected will have an influence with the two principal operating corporations. It is also said negotiations are pending between the Colorado Fuel & Iron Co. and the Victor Fuel Co. at Trinidad, the principal southern field, whereby a settlement may be reached by the end of the week. The United Mine Workers of America has furnished transportation to large numbers of the strikers to go to the Texas and Oklahoma coal mines.

Clear Creek County.

There are several development tunnels being driven in Idaho Springs district. The central tunnel of the Big Five Co., driving for Edgar, Belman, Dove's Nest, Bald Eagle and Calvin lodes, is progressing. Two tunnels of importance are driving at Fall river; one, the Lucania, which is cutting into Bellevue mountain at 750 feet, opened two veins, each 12 feet wide, but of low-grade mineral. The company has forty claims within the distance of 3000 feet. Considerable depth is being attained and the bore is going in at rate of 5 feet per day.

The Big Five Federation proposes to build a 100-ton mill below the mouth of the Central tunnel, near Idaho Springs, which will cost $40,000, says the Times. The dump rock from the tunnel is being graded down Clear creek and a bridge will be built across the creek. The ground below the mouth of the tunnel to the Jackson mill is owned by the Big Five. The mill will be built in units of 100 tons capacity, and the first unit will have a complete sampling arrangement. By April it is expected the Shafter mine will have been cut by the Central tunnel and the ore from this and the Edgar and other veins will assure a production to keep the mill busy.

W. E. Renshaw, manager of the Con. Gem M. Co., near Idaho Springs, says that prior to building the mill at the mouth of the Newhouse tunnel the capacity of the Newton mill will be doubled. This will be on the site of the old State ore sampler, which was bought by the Gem Co.

It is expected work will be resumed on the McKinney and other claims, near Georgetown, leased and bonded by Kelso & Co. The face of the drift shows streaks of iron and copper which assay in gold.

Conejos County.

La Jara G. M. & M. Co. has bought a group of claims on Mount Blanca, near Alamosa. The property will be worked in connection with the Commodore mine and shipments of ore will begin this week.

Custer County.

At the Bassick mine, near Silver Cliff, the output is 225 tons a day, which is treated at the mill near the mine. The value is said to be greater than formerly when the rock was shipped.——The tunnel being run to connect the Rappahannock and Free Coinage shafts is completed. A shoot of gray copper ore has come into the vein that assays 50 ounces silver, $10 gold and 6% in copper. The tunnel was driven 146 feet, requiring seventy-two shifts. The properties are at Rosita, and are operated under lease and bond by J. T. Shaeffor and Dr. Bain. The Delaware is also in the group.

El Paso County.

President C. L. Tutt of the United States R. & R. Co. says work is being resumed at the Colorado-Philadelphia chlorination mill in Colorado City to make a test as to whether the tailings at the Standard mill can be worked at a profit. He says several thousand tons of the tailings have accumulated, and there is a profit for them if a cheap process of extraction can be discovered. The Colorado-Philadelphia plant has been idle for the past year and a half. All other plants are working, but not on full time.

Fremont County.

The Union Oil Co. of Boston, Mass., has leased 17,000 acres in the Florence oil field and will start operations next week by sinking two holes to depth of 2500 feet.

Gilpin County.

B. G. Granville, of the Eagle mill and the Franklin concentration plant on North Clear creek, reports having bought the Buckley mine on Gunnoll hill, near Central City, and has started operations with J. Loughran as superintendent. Ore is being broken and hauled to the Eagle mill and development work is being mapped out.

Gunnison County.

Pearson and Eckbert will drive a tunnel on the Buffalo group in Box Canon district, near Pitkin.——The Pueblo group of four claims, 1½ miles west of Bowerman City, was sold last week to W. H. Trout et al., for $5000.——The Colorado S. & M. Co. has driven its north Hall gulch crosscut tunnel, near Pitkin, for 500 feet. They have struck water, which is thought indicates a contact.——The contractors are driving the Leonidas tunnel ahead on West mountain.

Hinsdale County.

The Golden Wonder mine on Gold hill, 4 miles from Lake City, is being developed by a crosscut tunnel, which is nearing the ore bodies, says the Times.——In Alpine gulch B. N. Ramsey & Co. are running a 500-foot tunnel to cut the U. P. vein. Two shifts are at work.

The Hotchkiss Mountain M. & R. Co., owning and operating the Black Crook group of mines on Hotchkiss mountain, near Lake City, is having 500 tons of ore run through the Golden Fleece concentrating plant to determine a system of concentration that will separate the ore, making three products—lead, zinc and iron minerals. The gold values are mainly in an iron oxide and in tests heretofore, in saving the lead and zinc, the high-grade ore was lost in the tailings. The company proposes to build a mill on its group.

The Red Rover M. & M. Co., owning the Lillie group of mines up Henson creek, near Lake City, will start up next week after a shut down of several months. The Lillie is equipped with a 60-ton mill. G. Staples of Lake City is superintendent.

San Miguel County.

J. Ekman, manager of the Calumet M. Co., operating on Bear creek, near Telluride, says he will keep men on development work during the winter. He has opened up ore showing free gold.

Teller County.

W. H. Gilbert, manager of the Milwaukee Leasing Co., operating on the Lo Clair claim at Anaconda, is shipping one carload of ore per week, giving returns of three ounces gold per ton. The shoot in the south drift has widened to one foot. When the shoot was first cut in the shaft at depth of 335 feet it was 1 inch wide. The vein is fluorite, sprinkled with sylvanite. Gilbert has twenty men at work and is drifting north and south on ore. Preparations are being made to put in a heavier plant of machinery, with air compressor and drills.

H. W. Mitchell of Colorado Springs, secretary, says the Hummor G. M. Co. has been organized and has taken over the property of the Humholdt G. & S. M. & M. Co., in Cripple Creek district.

IDAHO.

Blaine County.

The Idaho Con. M. & D. Co., Ltd., has been organized at Salt Lako City, Utah, with the principal place of business at Soldier, Idaho. Its directors are J. B. Gioske, F. Housman, J. D. Caldwell, W. H. Millard, J. H. Herrington and W. Wagoner. The company owns the Goldon Rule group of seven claims on the Big Smoky river, and the Sally Slim group of five claims on the South Boise river. They are argentiferous galena claims.

The Lipman Mines & Tunnel Co. has been incorporated at Salt Lake City, Utah. Manager M. H. Lipman says their holdings near Hailey and at Bullion consist of a group of mines adjoining the Red Elophant on the west, the Bullion and the Mayflower on the east. In their development he has driven into the group a distance of 650 feet, where a ledge was struck, the ores showing 28% lead, 240 ounces silver and $6 gold per ton. In addition to the first-class ore, the vein, 8 feet between walls, contains considerable milling ore, for the concentration of which a plant will be built. To gain depth of 1200 feet on the ledges, to drain them and to provide outlet for the ore, the company will drive a tunnel from Red Elephant gulch. H. M. Wells is president; and F. J. Kiesel, W. A. Nelden, F. Harris, M. H. Lipman, R. S. Wells and C. E. Hudson are directors.

Boise County.

C. Wilkie of Idaho City for a Portland, Or., company, has a bond on a group of five quartz claims in Gambrinus gulch, 7 miles northeast of Idaho City. The group includes the United States mine and the Washington mine.

Idaho County.

C. W. Ray of New York, manager of the Comstock G. M. Co. of Thundor Mountain, says the showing made by recent development work has proven satisfactory, and the company will put in a 100-stamp mill next season, reports the Weiser Signal.

F. Brown, superintendent and manager of the Jumbo M. Co., operating at Buffalo Hump, says 150 men will be employed in the mining properties of the camp during the coming winter, and 500 persons will winter there. Brown is interested in the development of the Del Rio, an extension of the Jumbo on the south. It consists of four claims, and the ore body has been opened at depth through the lower tunnels of the Jumbo.

Shoshone County.

Bedrock was struck last week by the Eagle Creek G. M. Co.'s hydraulic elevator at the mouth of Fancy gulch, near Murray, at a depth of 47 feet, says Superintendent J. F. Murphy. The bedrock consists of a crushed quartzite, which can be shoveled up for a depth of 18 inches.

It is reported the Blackhawk mine, which has been closed for a month, is resuming. The mine works twenty men. It is near Government gulch, near Wardner, and has a big body of silver-lead ore.

At the St. Louis & Idaho Co. mine near Burke, which adjoins the Hercules to the south, Superintendent Collins has run 146 feet in six weeks on the 325-foot crosscut tunnel being driven to the ledge. At a meeting of the stockholders it was decided to allow the Hercules Co. conditional right of way through the St. Louis & Idaho ground for their proposed 2½-mile tunnel from the mine to Burke, to be used in hauling ore from the mine to the railroad. This tunnel will tap the St. Louis & Idaho Co.'s two ledges at 1000 feet depth below the surface. The St. Louis Co. reserves the right to also use the traction tunnel for taking out ores.

KANSAS.

Cherokee County.

Twonty acres of the Tom Clark forty, where the lead shaft is located, near Baxtor Springs, have been leased by Wheaton & Goodwell of Joplin, Mo., and T. J. Morrow, of Baxter Springs, and work of opening up the ground was begun last week.

At Baxter Springs Goodwin & Wagner, backed by Kansas City parties, are sinking on their lease. They are down to the 50-foot level, where the first ore was struck. They have put in a steam plant, including machine drill. They will run double shifts. They will let a contract for a shaft 185 feet deep on the Bingham lease, south of the Perkins workings.——The Sunnyside has its boiler plant in operation. The mine is being unwatered and it is proposed to build a milling plant.

Porkins, Keashy & Co., near Baxter Springs, are sinking two shafts, one on the Crawfish land and the other on the Bluejacket tract, both of which they have under lease.

MISSOURI.

Jasper County.

W. G. Bryant and J. W. Durby have bought the Sperry-McLain M. Co.'s mill and mine at Neck City, says the Joplin News-Herald.

E. Carmount has bought the Haggard mine and mill on the Cornfield and J. B. Chattleton of Joplin is superintendent.——C. C. & G. H. Playter, G. T. Fletcher, C. B. Rice, T. C. Creighton and B. W. Lyon have incorporated as the Highland M. Co., to operate near Joplin.

A strike of ore has been made in the Tusing shaft on the Stewart lease, south of Zincite, says Superintendent Tusing. The shaft was down 128 feet. With M. Maholl and J. Peel, they have four lots, with a twelve-year lease.

At Ragville, near Duenweg, additional ore bodies are being opened up. On the J. Collings land, 2½ miles southeast of Duenwog, along the ridge from Oronogo to Granby, a mine is being developed by Fehr et al. High-grade lead and zinc ore is being raised from a drift at a depth of 125 feet. A drill hole 50 feet from the shaft shows 30 feet of ore. As soon as the ground is sufficiently opened up a mill will be built.——The Hardin and Keokuk mines are being developed, and at the mines on the Burch land two mills have started up.

Lawrence County.

The Sand Ridge plant at Aurora was in operation last week on tailings and dirt taken from the upper drifts. Work will be started this week on the lower levels. J. M. Maret of the Sandy Hill mine is also superintendent of the Sand Ridge.——The work of putting in the plant at the Big Bonanza mine at Aurora is progressing. The steam jigs and the boilers are in place. Work underground continues.

MONTANA.

Governor Toole has called a special session of the State Legislature to meet December 1 at Helena, to pass laws that will relieve the industrial condition in Montana, the result of the Heinze-Amalgamated litigation, which closed down all the properties of the Amalgamated C. Co. in the State. Because of this action, President W. Scallon, of the Amalgamated, says work is being resumed in all their properties. In Butte 6500 men are back, in Anaconda 2000 men are again at work in the Washoe smelter and at Great Falls the Boston & Montana smelter has started with 2000 men. The other properties of the Amalgamated in Idaho and Wyoming will be started up.

Beaverhead County.

A company of Pittshurg, Pa., men has bought a group of twelve copper claims on Birch creek, near Dillon, heing the Last Show, Gagnon, Standard, Mother Lode, Gold Leaf, Golden Treasure, U. S. Treasure, Lookout Fraction, Squaw, Indian Chief and Gladstone. G. M. Snow of Nampa, Idaho, is consulting engineer. The U. S. Treasury mine has produced iron ore which was used hy the Hecla Con. M. Co. for fluxing. The principal work has hoen done on the Golden Treasure claim. A shaft is down 150 feet, with 170 feet of crosscuts and levels and a tunnel 130 feet long.

Fergus County.

Work is progressing on the Victor group, at the head of Plum croek, near Kendall, says M. Dunn of Great Falls, part owner.

Superintendent C. T. Durrel of the Chicago-Montana M. Co. in Whisky Gulch, near Kendall, says they have begun crushing ores from the Big Six group in the Whisky gulch mill. He has mon at work on the aerial tramway from the Big Six to the mill. The tram will he 3900 feet in length. A 200-ton ore hin will be huilt at the mines.

W. G. Moore is operating a diamond drill on the Norman group, south of the Kendall bonanza, near Kendall. The drill is down 600 feet and it is reported to be in porphyry.

Jefferson County.

The flume huilt for the concontrator of the Cataract C. Co. in Cataract district, near Basin, is finished and water turned on in the mill, says the Basin Progress. The flume is 12,400 feet long and 600,000 feet of lumher was used in its construction. The water is takeu out of the Boulder rivor at Red Rock. There are two tunnels, one 80 feet in length and the other 25 feet, and two trestles of 350 foet and 380 feet, one crossing Sullivan gulch being 30 feet in height. The water has a fall of 2 inches in 100 feot, giving the current a velocity of 5 feet a second. The water was heretofore pumped from the river to the top of the mill.

The Basin & Bay State M. Co. at Basin last week leased the mine to the Jefferson County M. Co., which company includes some of the stockholdors of tho Basin & Bay State Co. Development will be increased and the concentrator put in operation.

The Basin-Comstock M. Co. has been incorporated by W. A. Kidney and A. S. Ray of Basin, H. Layne, C. Sturtevant and W. Banden of Butte, to operate near Basin.

Work is reported progressing on the smolter under construction on Jack creek, near Basin, for tho Cataract C. M. Co. It is expected to have the smelter in operation by Dec. 15th. Work has been delayed by lack of lumher. The buildings are up and work on the foundations for the furnace and machinery begun.

Mulvahill & Ely of Helena have heen granted a thirty-day extension of their lease and bond on the Daly properties at Wickes. Tbey are planning to put in a larger mill and have beon held back by a shortage of water, but expect to start building this month.

Lewis and Clarke County.

E. Hanschka aud G. M. Johnson, of Deadwood, S. D., have bought and bonded 400 acres of mineral 40 miles north of Helena, and expect to put up a mill in the spring. Timher and water are at hand. They will use stamps and plates, and a cyanide plant will also be added.

The Standard Ore Co. of Helena, J. C. Cory superintendent, which controls the Jay Gould group, near Helena, has decided to put in a 30-stamp mill, instead of the 20-stamp as at first proposed, as well as a cyanide plant.

J. R. Quigley, operating near Ophir, reports taking out molybdenite. A tunnel has been run 430 feet, and at 350 feet the vein was struck and has heen cut for 45 feet.

Madison County.

In running the tunnel by tho Garnet G. M. Co., near Pony, 200 feet from the mouth a blind vein was cut, 11 feet in width, with 2 feet of ore carrying gold and silver, and 9 feet of milling rock. This find is 300 feet from the 20-stamp mill of the company. A contract for an additional 1000 feet on the same tunnel has been let to D. Phillips of Basin, making the work, when completed, 1300 feet in length. Phillips is fixing up the ditch and will install an air compressor, receiver, drills, etc.

W. W. Morris is operating the Clipper and Boss Tweed mines, near Pony, under lease. The Strawberry 10-stamp mill, also owned by Morris, is being overhauled and put in shape to treat tho second-class ores. Electric power will operate tho mill and light the mino workings.

A strike is reported in the shaft of tbe Oregon mine, near Pony, under bond and lease to C. Wiedeman. He is building a 5-stamp mill and putting in a 25 H. P. gasoline engine. The structure is large enough for five additional stamps, which will he placed later. The tailings will be cyanided in the gulch helow the mill.

Missoula County.

R. Daxon of Wallace, Idaho, president of the Tarhox M. Co., operating on Packer creek, 2 miles north of Saltese, says he has increased the numher of men at work and are drifting west on the 400-foot level in the shaft. A crosscut of 100 feet from the hottom of the shaft proved the vein 26 feet wide, with 10 feet of concentrating ore. It runs 15 ounces in silver and 20% lead. It is proposed to build a 120-ton concentrator.

Silver Bow County.

The smelter of the Pittshurg & Montana C. Co. at Butte is expected to he ready to receive ore hy Jan. 1. C. M. Allen is superintendent.

NEVADA.

Douglas County.

The Nevada Placer G. M. Co., operating on the North Fork of the Carson river near Gardnerville, is concentrating 300 tons of gravel into hlack sand, which assays $100 per ton, says the Courier. The concentrators are handling twenty tons of gravel per day.

Esmeralda County.

At the Midway mine at Tonopah the east and west drifts on the 535-foot level continue to produce ore. The ore will he worked at the mill heing erected on the Midway ground. It is reported negotiations are under way to consolidate the Silver Top with the Midway group.

Last week L. L. Patrick made tho first payment of $5000 on the Combination group of claims, in Goldfield district—formerly the Grandpa region—25 miles south of Tonopah, whicb he has hought for $75,000. The property comprises thirteen claims, on all of which some work has heen done. A. M. Myers is superintendent.

The drift wbich is being driven for air toward the North Star mine at Tonopah is going ahead, and the North Star has put in two shifts of men driving west toward the Montana-Tonopah. Connection is expected to he made hy Dec. 1. The winze on the ledge, 200 feet north of the shaft on the 512-foot level, is down 30 feet and in ore. During month of October the shipments from tbe Montana-Tonopah aggregated 270 tons. The size of the ore house has been doubled and a second grizzly put in. The company will also put in a rock breaker, and in future shipments will consist of only one grade of ore instead of two.

It is reported the Adolf Weher mines on Cat creek, near Hawthorne, have been bonded to C. Brougher of Tonopah for $15,000. The property consists of a group of eight claims, which show ledges of free-milling gold ore running $6 per ton, says the Walker Lake Bulletin. Timber in abundance is on the ground, also water for milling purposes.

Eureka County.

(Special Correspondence). — The Williamsburg mine, on Adams hill, a former producer, is showing prospects of ore in the quartz-porphyry. The Williamsburg is being developed hy R. A. and W. Laird and Young Bros. on a lease. A hoisting plant has been built.

J. McNaughton, owner of the McNaughton mine, has taken out high-grade ore from depth of 600 feet and proposes to increase development work this winter. The McNaughton adjoins the Silver Conner, on which lessees are driving a tunnel to take ore from the main shaft near the third level.——M. Hartnett is developing the Industry mine, near the Diamond Co.'s mines in New York canyon.

E. P. Low will open up his group of claims south of Eureka.——Negotiations are under way with New York men who propose to buy the Silver Conner mine.

The proposed construction of the Western Pacific Railroad through Diamond valley, 8 miles north of Eureka, is encouraging mine owners in Eureka district. A cheaper froight rate on ores to Salt Lake would cause increase of mining operations.

Eureka, Nov. 10.

Lincoln County.

Superintendent A. B. Day of the Searchlight M. & M. Co., at Searchlight, has put on more men and work in progress consists of sinking the main shaft and of making air connections with the incline shaft. The main shaft has heen equipped with a wbip. The bottom is in ore.

Superintendent Harrington of tho Quartette M. Co. at Searchlight is developing his supply of water in order that ten stamps may be added and the mill kept running continuously. He will use the water in the Good Hope shaft. Manager Carper of the Good Hope will put in a pumping plant and raise the water to the surface; it will then he piped hy the Quartette Co. to its mill—a distance of 1000 feet. To further increase the supply a well has heen sunk at the foot of the tailings ponds and drifts are heing run from the hottom of the well to catch all seepage. It is not expected the mill at the river will he run this winter. The electric light plant is in operation. All the surface huildings have heen wired and also the main working shaft.

The Newport-Nevada M. Co. of Fay has made arrangements with the Shawmut & Nevada Co. wherehy they are to receive all the waste water from the Horseshoe tank on the summit, which will be used to operate the Homestake mill, says the Stateline Oracle.

G. E. Otis and the Cyrus Noble M. Co. have hought the W. H. Bainhridge interests in a group of three claims adjacent to the Cyrus Noblo group near Searchlight.

Nye County.

At the Hasbrouck mine, near Tonopah, machinery is on the ground and hoing set up. The working shaft, 125 feet north of the croppings of the main ledge, is down 30 feet and progressing. The tunnel, which is in 485 feet, will be completed within the next 40 feet.

Storey County.

The annual report of Superintendent J. R. Ryan of the Con. Cal. & Virginia mine, at Virginia City, shows the aggregate quantity of ore taken out during the year ended Sept. 30, 1903, was 4657 tons. There were carried over from the previous year ninety-nine tons of ore, assaying, on a hasis of gold value, $15.78 per ton. During the past year 3267 tons of ore were milled at the Kinkead mill, yielding $22.78 per ton. Thcre were sold to the Selhy S. & L. Co. 521 tons of ore, yielding $103.83 per on. In all the above, silver is calculated tat 1.2929 per ounce. There were 4880 ton of tailings sold, for which $868.08 was received.

White Pine County.

Manager P. H. Cannon of the Old Imperial M. Co. has men at work opening up a body of gold and silver ore in the Last Century mine, near Cherry Creek.

A. H. Vaugbn of Seattle, Wash., has hought the Ella J, Mabee, Burnt Timber, Shortly, Dubacon and Climax, silver-lead producing mining locations, on Mount Washington, 20 miles south of Osceola, says the Ely News, for $6000.

The Grand Deposit C. Co. has been incorporated by J. Stanton, J. S. Page and P. de P. Ricketts, to operate the Grand Doposit group of claims at Muncoy creek, near Cherry Creek.

The Midnight and north half of the Wild West claims have heen bonded and leased to F. Herrell et al., who are taking out ore from both claims, which are in Cocomungo, near Cherry Creek, says the Cherry Creek Minor.

NEW MEXICO.

Dona Ana County.

Considerable mining activity is reported around Victoria, between Hachita and Hermanos in Grant and Luna counties, says the New Mexican. A smelter and a railroad branch are proposed. Fourteen miles south of Victoria on hoth sides of the International line, a numher of copper prospects are being developed. A Denver, Colo., company is interested and has surveyed a railroad from Victoria to the mines, a distance of 14 miles. The district is being prospected for water with a view to building a smelter. F. K. Wyman and J. Corbett of Deming have started work on the Jessie and Helen claims in this district.

Grant County.

A strike of copper ore is reported made on the property of J. L. Bevers, between Hanover and Fierro, under lease to the Con. M. & S. Co., which .operates the smelter at Cerrillos.

The National G. & S. M. & M. Co. expects to have its smelter at Steins Pass running this week. The company owns the Beck mine, which carries values in gold and silver.

J. Sterling of Lordsburg, manager of tbe Consolidated M. Co., says they have bought a group of mining properties at Gold Hill, and will build a mill.

Lincoln County.

The Dividend M. & M. Co. will resume operations at Estey City next week. A reduction plant has been built. The water supply has heen short, but thoy will sink a well to the depth of 2000 feet if necessary.

Luna County.

The concentrator which was bought by the Sierra Florida M. Co., near Deming, bas been overbauled and additional machinery put in. It will he roady to start by next week.

Rio Arriba County.

The Ponnsylvania M. & M. Co. group of mines in Bromide district, between Hopewell and Tres Piedras, was sold last week at Tierra Amarilla at Sheriff's sale to W. J. Kennedy of Pittsburg, Pa. Work will he resumed on the Mineral Point mine at Tres Piedras. The Mineral Point has 5 feet of ore which runs $10 in gold, hesides silver and copper, says the New Mexican.

Sandoval County.

The Otero sulphur mills at Sulphur, 50 miles west of Santa Fe, are running at their full capacity, and twenty men are employed. Additional machinery will he put in to increase the capacity. The United States last year consumed 520,537 tons of sulphur, exclusive of sulphur recovered from fumes from roasting hlende. Three-fourths of that entire amount was imported in form of brimstone from Sicily and of iron and copper pyrites from Spain.

Santa Fe County.

Work on the Hazleton mine, near Golden, resumed this week. The Argo M. Co. has heen sinking a shaft on the Hazleton mine, which is now down 490 feet. At the 478-foot level a vein was found carrying free gold, hut the main ore hody, which is 3 feet wide, is refractory, and a reduction plant will be huilt. Sinking will continue.

Sierra County.

The main shaft of the El Dorado mine, near Hillshoro, is heing timbered hy the Bigelow G. & C. M. Co. A whim is heing set up and sinking will be resumed. The main shaft will he sunk to a depth of 500 feet.——The connections between the pumping station and the mill of the Ready Pay pipe line, near Hillshoro, has heen completed and the mill started up last week. The capacity of the water plant is 2000 gallons per hour and the water supply for ten hours is sufficient to keep the mill running twenty-four hours.

Taos County.

J. T. Erickson of Cripple Creek, Colo., P. E. Erickson, J. F. McMahon and J. E. Collior havo a bond and lease on the Westoby-Reed-Oldham interests in the Golden Treasure mine at Red River, giving them a controlling interest. Men will he put to work on the mine this week. It is near the Jayhawk, Gold Coin, Scarlet, Banner, Golden Calf and other claims.

OREGON.

Baker County.

W. C. Rutter, of Seattle, president of the Kittanning M. Co., operating the Big Four group, near Sumpter, says he will start a crosscut to be carried a distance of 700 feet to open up the vein, and will give depth of 500 feet.

The Fortune M. & S. Co., operating in Greenhorn mountains, near Greenhorn, proposes to put in mills on both the Humboldt and Red Lion mines. The plants will be 20-ton grinding mills. R. N. Jackson, of Baker City, is president.

The Geiser-Hendryx Co. is arranging to put in a heavier sinking plant for the Gold Pan mine, near Sumpter. A 10-stamp mill will also go in. The present hoisting machinery will be taken out and transferred to the Tabor fraction, operated by the same company. The vein at the Gold Pan at the 200-foot level on the inclino has been eut, showing a width of 16 feet.

Work has been hegun on the stamp mill for the Golden Wizard mine, near Sumpter, says Superintendent McPhee. It will be a 12-stamp mill, rapid drop, quadruple discharge, with amalgamation, concentration and cyaniding of the roasted concentrates on the ground. The stamps will weigh 1000 pounds each. In addition the plant will be equipped with five table concentrators.

Superintendent J. Reed says the Auburn Deep M. Co. will take up the bond it holds on the Auburn placers at Auburn.

The Pine Creek placer mine, 22 miles from Baker City, has been sold to E. F. Zinns et al. of Chicago, Ill., for $60,000, says the Sumpter Miner. Machinery for hydraulic and dredging operations is heing taken in.

C. R. Aldrin, manager of the Tempest mine on the head of Granite Boulder creek, near Greenhorn, says he has heen developing water power for future operation of the property. He has acquired water rights in Boulder creek and will develop 800 H. P. by fluming 1 mile. The fall is 400 feet. Devolopment work in the mine will be increased.

A 25 H. P. hoist is being set up by the Mammoth M. Co., near Bakor City, says M. Whelan, manager. The Mammoth is east of the Virtue mine and is developed to depth of 320 feet.

E. P. Bergman of Sumpter is developing the Ole Bull group of claims in Cracker Creek district. The main tunnel is in 100 feet and ore is showing. The group is near Hanover. —— A 12-foot vein of ore,

carrying $10 per ton, is reported opened in the north stope of tunnel No. 5 of the California mine in Cable Cove district, near Sumpter, says Manager Bellman. He is driving to the north of the old workings. —— Manager Costello of the Storm King group, in Cable Cove district, last week put on more men. The tunnel is going ahead on the ledge.

The Ladd Metals Co. of Portland is building a smelter at Homestead, on the Oregon side of the Snake river, near the Iron Dyke mine, to treat ores of that district and from the Seven Devils, Idaho, copper mines. The rebuilding of the Ladd Metals Co.'s smelter at Mineral City, Idaho, is about completed and is expected to be ready to blow in next month. The copper-gold-silver mines of the Mineral City camp are accumulating ore for treatment. Work on the Homestead smelter is delayed owing to difficulty in transporting machinery. A sampling works is also being built.

The Badger group of claims, near Blue River, has been sold for $15,000 to the Oregon Blue River M. Co. of Philadelphia, Pa., of which W. T. Wykoff is president. W. L. Beckner is superintendent. It is intended to equip the property and run a tunnel 300 feet. It is near the Sunset group, owned by Dodge & Runyard.

Douglas County.

G. H. Scott, A. Mutz, L. Dohbin and O. Mercer, having leased coal properties 3 miles from Roseburg, on the Southern Pacific railway, have incorporated the Fernio Coal M. Co., with H. Smith as superintendent. The lease was for twenty-five years. The coal is a lignite, and there are said to be several seams, varying in width from 3 to 7 feet. A steam pump is being put in to unwater the prospect holes. The Southern Pacific will put in a 3-mile spur.

Grant County.

N. E. Berkloy of Pendleton, interested in the Buffalo mine, near Granite, says operations will be resumed on the group this week.

O. O. Benson of Portland has men at work on his Gold Staudard group in Rabbit Creek district and reports breaking into ore. The Gold Standard adjoins the Gold Bug.

Jackson County.

Besse & Co. of Seattle, Wash., are putting in a 2-stamp quartz mill on the Pilgrim mine for prospecting a group of eight claims they have under bond known as the South Extension of the Pittsburg on Wagnor creek, near Ashland.

Josephine County.

The May Queen, Double Standard and Silver Standard quartz claims on Mount Baldy, near Grant's Pass, have been bought hy the May Queen M. Co. of Albany, N. Y., and development work is under way. The lodge on the May Queen is 5 feet in width, carrying values in free gold and sulphurets. There is a 2-foot shoot in this ledge from which quartz has been shipped to the smelter, giving returns of $26 a ton. A. A. Cameron of Grant's Pass is superintendent.

Malheur County.

In Morning Basin district, near Malheur, the Boston Co., which bought the Tarhall mines, is putting up several buildings and is erecting a hoist, the machinery for which is on the ground. The tunnels and underground workings are being timhered with 8x8-inch sawed timber. It is expected the company will build a 10-stamp mill. —— The California group, across the hasin from the Tarhall, owned hy Portland men, is heing worked continuously. Ore is heing taken out and stored for treatment; W. E. King, superintendent. Adjoining the California group is a property being operated hy an Oregon City company under the superintendency of P. Wells of Oregon City.—— The Rainbow is heing steadily worked and the ore taken out is hauled to a quartz mill 2 miles distant on South Dixie creek. The ore averages $40 to the ton.

Union County.

The Eastern Oregon M. & M. Co. has heen incorporated and proposes to build a 250-ton smelter at North Powdor, hetween La Grande and Baker City, on the O. R. & N. Plans are heing made to connect the smelter hy electric lines with the mines of the outlying districts. Water powor will be secured from Anthony creek, says the Portland Telegram.

SOUTH DAKOTA.

Lawrence County.

The Wauconda C. M. Co. is preparing to take out copper ore which will he hauled ½ mile to Woodville on the Burlington railroad a nd shipped to a smelter at Rapid City. The ore is said to average 8% in copper and $3 gold per ton. Superintendent F. Ames says in one shaft thoy have opened at a depth of 85 feet a vein of free-milling gold ore averaging $4 per ton. A hoisting plant is being built and a mill is also proposod.

UTAH.

October in the ore and bullion market closed on settlements aggregating $2,125,-395, exceeding all previous records, says the Salt Lake Tribune, though the tonuage from Tintic's principal producers was, for an interval, entirely overcome hy a fire underground. In addition to settlements in open market the copper plants operated by the indepeudent companies were productive of copper hullion containing gold and silver, for which $800,000 was received from the Eastern refineries, this making $2,925,395. The output of November is expected to exceed that of October, as the Tintic mines are again in operation, whilo the Boston Con. and Yampa of Bingham will next week begin forwarding several hundred tons daily. The copper output of the State during tho month reached a total of 3,356,200 pounds, carrying silver and gold. The product was distrihuted as follows: Bingham Con., 728,560 pounds; Highland Boy, 1,200,000 pounds; United States, 727,640 pounds; American, 700,000 pouuds. Total, 3,356,200 pounds.

The furnaces at Murray of the American S. & R. Co. exceeded their previous records during Octoher and reduced 42,-620 tons of ore. To handle the increasing tonnage which the miners are preparing to seud out the American S. & R. Co. will huild a copper plant besido that of its load blasts at Murray. The Newhouse mines at Frisco are ready for copper furnaces, as are also those of the Boston Con. at Bingham; while furnaces for reduction of the Yampa's copper-bearing ores are being rushed to completion.

The coal miners of Utah have been granted an increase of 10% iu their wages. Reports from the camps show that the advance has been goneral, the rate of pay being raised from $2.50 to $2.75 a day. The coal miners in Utah are reported to have heen unfavorable to the general strike movement started in Colorado this week. Utah coal minos employ 800 men.

Beaver County.

Manager Bettles of the Newhouse mines, near Frisco, says tho Wah Wah pipe line has been laid for a distance of 30,000 feet, and it will be completed hy Nov. 20. The line is laid with 14-inch pipe at each end and 12 inches in tho center, and the pipe works shipped the wrong dimensions first, which has delayed the work. The total length is about 37,000 feet. With the water delivered to the site of the proposed works at Newhouso work will proceed with construction of the smelting plant.

S. Nowhouse of Salt Lake City proposes to huild an electric power plant on the Beaver river, near Beaver City, to generate power for the Cactus mine and smelter at Frisco, says the Deseret News.

The Indian Queen M. Co. has been incorporated at Salt Lake City hy L. N. Morrison, E. E. Mork, J. M. Hansen and C. & K. Morrison, to operate the Indian Queen and Belcher claims, in Preuss district. near Frisco.

Juab County.

Shipments from Tintic district for month of Octoher were:

	Cars ore.
Bullion-Beck	2
Carisa	10
Centennial-Eureka	184
Eagle & Blue Bell	10
Eureka Hill	8
Gemini	15
Grand Central	94
Lower Mammoth	13
Mammoth	16
Swansea	17
South Swansea	28
Star Con	19
Yankee Con	18
Ten others, total	33
IRON ORES.	
Black Jack	21
Dragon Iron Mine	125
Noon Iron Mine	8
CONCENTRATES.	
May Day	2

The output of the Bullion-Beck, Centennial-Eureka, Eureka Hill and Gomini mines shows decrease, due to the fire which caused suspension for three weeks.

The office of manager having heen aholished by the stockholders of the May Day Co. at Eureka, the former duties of such will he attended to hy Superintendent Matthews.

Salt Lake County.

The Caitrow Co. expects to treat 150 tons of ore daily in the Winnemuc mill at Bingham, when it will remodel.

The Tilhurn M. Co. of Salt Lako City has heen incorporated to operate a group of six unpatented claims in Little Cottonwood mining district, near Alta, hy L. P. Palmer, Z. F. Scott, H. C. Edwards and F. O. Frick.——The Zenas M. Co. of Salt Lake City has heen incorporated hy Z. F. Scott, A. A. Barker, H. C. Edwards and F. O. Frick.

Tooele County.

The Greene Reduction Works will work over the tailings pond of the Sioux (or Farrel) mill at Robinson, which has been bought hy D. A. Depue.

Utah County.

The Signet G. & C. M. Co. of Salt Lake City has heen incorporated hy C. E. Steward, M. C. Moyer, A. W. Lister and E. E. George. The company owns the Siguet group of four claims, in American Fork district. The company has buildings up already and has started development.

WASHINGTON.

The gold receipts for the United States assay office at Seattle, Wash., for the first five years following its establishment, July 15, 1898, amounted to $73,364,790.18. F. A. Wing, assayer in charge, has compiled a statement of the receipts of the office for the five years ending July 15, 1903, as follows:

Nome, Alaska	$11,285,971.08
Balance of Alaska	2,654,037.79
Total for Alaska	13,940,008.87
British Columbia and Canada	3,428,780.47
British Yukon (principally Klondike)	51,812,114.37
Washington, Oregon, Idaho and Montana	1,153,856.47
Total	$73,364,790.18

For this period there were 25,000 deposits. The aggregate of gold weighed ahout 150 tons, avoirdupois. Since tho 15th of July of this year there has heen received at the Seattle assay office gold to the value of $8,581,000, which, added to the above total, makos the aggregate receipts to September 9th $81,945,790.

WYOMING.

Bighorn County.

The Bonanza Oil & Dev. Co., composed of local and Omaha, Neb., men, has hegun drilling operations to sink two wells in the Bonanza fields near Basin.

Carbon County.

Work is resuming at Three Forks camp on the State line, south of Battle. Galena and copper ores are heing opened up. The Three Forks M. & R. Co. is operating Three Forks, Battle Ax and a group covering 320 acres of placer claims. The Boston-Sierra Madre M. I. Co. is operating the North Fork group. The oro is chiefly galena, with gold, silver, iron and lime, though in places zinc replaces the galena hut carries equal values in the precious metals. The Boston company is making several improvements, including a shaft house and a heavier hoist. At Three Forks the altitude is 7600 feet above sea level. L. A. Pease is manager of the Boston company.

The Northwestern C. M. Co. of Grand Encampment has hought a three-fourths interest in tho Bacholor group of nine claims, lying 5000 feet west of its Forris-Haggarty group, and in the same formation as the Rudefeha mine.

Laramie County.

The Goshen Hole Fuel Co. has heen incorporated to exploit throe coal veins located in northern Laramie county, by W. Sturgis of Cheyenne, with M. Ryal and H. M. Thornton of Denver, Colo.

The Harvest Moon M. & M. Co. has heen incorporated hy G. A. Walker, H. T. Bruce and L. C. Treloar of Buena Vista, Colo., to operate in Laramie county and in Chaffee county, Colo.

FOREIGN.

AUSTRALIA.

Queensland.

At Rockhampton the Dawson Coal M. Co., adjoining the Dawson Island coal mine, has a diamond drill plant in operation. They will sink a working shaft. The Dunstan Co. is producing coal.

At the Mount Morgan mine at Mount Morgan exploration work continues with the diamond drills. During the quarter ended Sept. 30th 2000 feet of horing was done, chiefly towards tho west from the 650-foot level. Ores containing hoth gold and copper in payable quantities wore met with. Horizontal drilling will be stopped, and the ground below the 750-foot level will he tested. The quarter's output was 62,354 tons of ore, yielding 26,065 ounces gold. This is a decrease of 3266 ounces from that of the previous quarter, and $1.23 decrease per ton in average value. During the quarter 54½ tons of copper precipitate, estimated to contain 75% copper, were ohtained from the waste liquors. This is the mine's largest quarterly output of copper, which is expected to further increase.

An air compressor and machine drills have heen put in at the Columhia Extended mine at Gympie.

BRITISH COLUMBIA.

East Kootenay District.

T. R. Stockett Jr., general superintendent of the Crow's Nest Pass Coal Co., operating at Fernie, Morrissey and Michel, says now that the lahor troubles are over the regular daily output is 3400 tons of coal and 8000 tons of coke. Even without the new coke ovens, which are nearly finished, the output is more than the present demand, and there are 50,000 tons of coke on the dump awaiting orders. When the new coke ovens are in operation tho production will be 12,000 tons of coke daily. The October payroll of the collieries amounted to $147,850.

Slocan District.

J. Cory and J. Foster have a lease and hond on a group of claims comprising the Medford, Cinderella, Keiser and Keisor Fraction, along the C. P. Railway, half way between Sandon and Three Forks.

Vancouver Island.

Tho Western Fuel Co. of Nanaimo will put in a 400 H. P. air compressor, which is expected to be in operation by Jan. 15.

West Kootenay District.

R. G. McLeod of Seattle, Wash., has bonded the Spyglass mine, Poplar creek section in the Lardeau, for $35,000. Quartz carrying free gold and silver is reported found on this claim last month.

CANADA.

Alberta.

H. N. Galor of Phœnix, B. C., secretary of the International Coal & Coke Co., which is developing its coal measures at Coleman, on the Crow's Nest Pass Railroad, near Blairmore, says he has awarded the contract for tho erection of the first hattery of 104 coke ovens. The output amounts to 100 tons of coal daily, and shipments are heing made. The colliery inside of ten months is expected to be producing 2000 tons of coal daily. Three hundred additional coke ovens are to he built next spring, when the company will have 600 men on its payroll.

Cassiar District.

The extension of the area of alluvial deposits beyond the Pine creek watershed this season has increased the output of Atlin camp, says T. Lees, and has opened new territory. This summer a local company hegan to exploit the deposits of auriferous gravels which characterized the Upper Dixie watershed to the southwest of the Pine-Spruce valley. The Bull Creek Co. opened up tho stream of that name, under Superintendent A. Carmichael, who reports the following work done: Twenty-five hundred feet of ditch dug, delivery on the ground of 500 miner's inches of water, installation of a small hydraulic plant, and 350 feet of hose connecting the monitor with the pressure hox. Lumher and supplies were hauled over the mountains and a large quantity of gravel was piped through the sluices hefore tho season closed, with encouraging results. Operations will he resumed in the early spring.

HONDURAS.

United States Consul A. K. Moe, at Tegucigalpa, writes a discovery of coal is reported made in the mountains in the Department of Yoro, and the field has been named "El Porvenir." Examination and test samples of the coal taken from near the surface show it to be of coking quality. The foot wall is said to he formed of a silicate of aluminum and magnesium. The results of the examination seem to warrant the opening up of these properties. All coal used in Central America is at present hrought from the United States. The section in which the coal field is located is remote from railroads or other means of transportation, and the profitable operation of mines would requiro building of railroads to get the product to markets; hut present and prospective demands will justify the necessary expenditure if development of the field gives assurance of an adequate supply of coal of good quality.

MEXICO.

Chihuahua.

The Southern M. Co. of Kansas City, Mo., owning mines in La Dura canyon, 18 miles east of Morelos, will resume operations this week. The company has 700 feet of development work done on three of its properties and has a 3½-foot Huntington sampling mill. The ores are free milling gold. P. Murray of El Paso, Tex., is interested.

Superintendent Gasson of the Baltimore mine has development work started on the Kansas Boy mine at Santa Eulalia for F. Collinson of Clarendon, Tex., who has an option on the property, says the Enterprise.

Durango.

W. Pettit of Parral, Chihuahua, is reported to have bought fourteen claims near Inde for $120,000 gold. The ore is argentiferous galena, carrying some gold.

Oaxaca.

At Taviche the Compania Minera La Blanca de Taviche has heen organized

with W. A. Alexander, F. R. Warly, T. P. Keeler as officers. Work will begin this month.

The Elena M. Co. has been organized at Mexico City to operate the Elena group, near Tavicbe, with the following officers: W. W. Graham, D. Signorett, F. E. Gaines, G. W. Johnson, J. V. Bell, H. W. Howe, H. K. Black and J. A. Fraser.

NOVA SCOTIA.

The Commissioner of Public Works and Mines, in his annual report, says the gold fields of Nova Scotia extend from Canso to Yarmouth and cover (exclusive of the masses of intrusive granite) about 3000 square miles. The gold field strata, originally horizontal, have been folded into numerous undulations having a general east and west course and north and south dips. In these undulations, interstratified with the rocks, are the gold-bearing quartz veins. These veins, owing to the denudation of the crests of the anticlinals or undulations, are seen in long elliptical outcrops, while underneath are similar veins not seen at all on the surface. Where these lower veins, untouched by denudation, pass over the axes of the anticlinals, they thicken, forming "saddle backs," due to the favoring conditions of the strata. In addition to these intercalated veins, there are others cutting the strata, which have been successfully worked. Gold is found in the surface earth of several districts. Nova Scotia gold having a fineness of over 900 parts, occurs as free gold in quartz with sulphides of various metals. It is extracted in stamp mills, and the residuum treated for the gold lost in the mills. There are a number of districts scattered through the counties of Guysboro, Halifax, Hants, Colchester, Lunenburg, Queens and Yarmouth.——Indications of petroleum have been observed at Lake Ainslie, in Cape Breton and at Cheverie, Hants county.

ROUMANIA.

The development of the petroleum industry in Roumania is showing increased activity, being assisted by government regulations. During first six months of this year Roumania exported 52,485,328 kilogrammes of petroleum against 36,925,000 kilogrammes exported during corresponding period of last year. Of this quantity 13,716,397 kilogrammos have been exported to England, 12,363,000 kilo. to Germany, 9,930,000 kilo. to Austria-Hungary, 6,312,000 kilo. to France, 4,281,000 kilo. to Holland, 3,923,000 kilo. to Italy, and 1,103,000 kilo. to Bulgaria. The exportation to Bulgaria and Italy has increased. From April 1, 1902, to April 1 of this year 236,459 tons of petroleum have been refined in the country.

RUSSIA.

The 214 wells completed in the Baku oil field last year show an average depth of 1302 feet, and an average initial production of 292 barrels per well per day, against an average depth of 1086 feet, and an average production per well per day of 330 barrels for the 358 wells completed in 1901, says the Oil Reporter.

Obituary.

JOHN LYNCH, a pioneer miner of Nevada and California, died at Applegate, Cal., on the 28th ult. Deceased was a native of Massachusetts.

CHARLES CONNON, a mining man of Helena, Mont., died on the 9th inst. at Helena, after a brief illness. Connon discovered the Stray Horse mine, which he afterward sold for $60,000.

F. FRATES, who has been superintendent of the Ione Coal & Iron Co., on the railroad grant at Ione, Cal., for twenty-five years, died on the 31st ult., aged sixty-seven years. Decoased was a native of the Azore islands.

J. W. BEARD, a pioneer miner of Nevada, died October 29th, at Tuscarora, Nev. He went to Nevada in the late fifties and operated for several years on the Comstock. When Lander county was organized he became interested in the Newark mines, near Austin. In 1867 he went to Tuscarora, and was one of the discoverers of the district.

SUPERINTENDENT R. B. TURNER of the Koarsarge mine, near Virginia City, Mont., died on the 6th inst., being suffocated with seven miners while underground, as a result of the workings being filled with smoke from a fire in the surface buildings. Deceased had been connected with the Alder M. Co. for several years, formerly as superintendent of the Kendall mine, and then of the Koarsarge. He is survived by a widow and one son.

Personal.

L. HURD of French Camp, Cal., is in San Francisco, Cal.

J. W. PINDER has returned to San Francisco from Downieville, Cal.

J. H. MACKENZIE of San Francisco, Cal., is in Arizona on mining business.

E. J. KNAPP, a mine owner of Rampart, Alaska, is in San Francisco, Cal.

C. WONACOTT of Tonopah, Nev., is in San Francisco, Cal., on mining business.

G. Z. EDWARDS of Salt Lake City, Utah, is examining mines at Tonopah, Nev.

E. E. EVERETT is in charge of the Virginia City Mining School at Virginia City, Nev.

W. H. TIBBALS of Salt Lake City, Utah, is in Chicago, Ill., on mining business.

H. I. SEEMAN, manager of the Yankee Con. M. Co. of Denver, Colo., is in New York.

O. C. ZINNS is in charge of the 15-stamp mill of the Plumas G. M. Co., at Greenville, Cal.

E. GRAVES is superintendent of the Terenates Con. M. Co. at Parral, Chihuahua, Mexico.

H. SQUIRES has resigned as manager of the Golden Eagle (McDonald) mines, near Oro Blanco, Ariz.

T. C. GORRIE, recently superintendent at the Harvard mine, Jamestown, Cal., is in Haywards, Cal.

A. S. ELMORE, inventor of the Elmore system of ore concentration by oil, is in San Francisco, Cal.

P. A. WAGNER, interested in mining near Mackay, Idaho, has returned from there to Denver, Colo.

A. P. CANTERS is superintendent of the North Star M. Co. at Tonopah, Nev., vice C. McCarthy, resigned.

J. E. BAMBERGER AND J. D. WOOD of Salt Lake City, Utah, are in Galena, Nev., on mining business.

O. S. BUCKBEE is in San Francisco, Cal., from mines in Alaska, where he has been for several years past.

D. MCVICHIE, of Salt Lake City, Utah, manager of the Bingham Con. C. Co., is in San Francisco, Cal.

J. E. DOOLITTLE has returned to San Francisco, Cal., from an inspection of mines in Tuolumne county, Cal.

W. L. COBB, E. M., of San Francisco, Cal., is in charge of the Piute mine and mill at Piute, Kern county, Cal.

A. M. MYERS is superintendent of the Combination group of mines in Goldfield district, south of Tonopah, Nev.

G. H. ROBINSON, manager of the Tintic M. Co., returned to Salt Lake City, Utah, last week from New York.

W. L. REID, foreman of the Smuggler Union cyanide mill, has returned to Telluride, Colo., from Denver, Colo.

MANAGER C. W. WHITLEY of the American S. & R. Co. is in Leadville, Colo., from Salt Lake City, Utah.

G. S. PUTNAM has returned to Sutter Creek, Cal., from the Mina Espiritu Santo, at Cana, Darien, Colombia.

SUPERINTENDENT BAKER of the Old Glory mine, at Oro Blanco, Santa Cruz county, Arizona, is in the East on business.

H. G. A. BRUNNIER, superintendent of the Conlin mine, near Grass Valley, Cal., returned there last week from a trip to Iowa.

W. F. DEANER, manager of the La Plata mine, Leadville, Colo., is in the East on business connected with his company.

I. A. CAMMETT, of Denver, Colo., has gone to California, where he will spend the winter looking after mining and other interests.

R. H. PASCOE, formerly of Rossland, B. C., and Gem, Idaho, is superintendent of the Cornucopia mines, near Baker City, Or.

W. L. BECKNER is superintendent of the Badger group of the Oregon Blue River M. Co., near Blue River, Lane county, Or.

A. A. CAMERON of Grants Pass, Or., is superintendent of the May Queen M. Co., operating on Mount Baldy, Josephine county, Or.

JOHN ROSS JR., superintendent of the Wildman-Mahoney mine, Sutter Creek, Cal., is in Trinity county, Cal., making mine examinations.

C. M. ALLEN, former superintendent of the Colorado smelter, is smelter superintendent for the Pittsburg & Montana C. Co. at Butte, Mont.

W. R. THURSTON, who has been with the Mine & Smelter Supply Co., Denver, Colo., has been transferred to their El Paso, Texas, branch.

H. C. LAWRENCE, manager of the Sevier Con. mines, on Gold mountain, near Marysvale, Utah, is in Denver, Colo., on company business.

J. S. CRAWFORD of Grants Pass, Or., is in the East on business for the Cleopatra copper mines in Del Norte county, Cal., of which he is manager.

S. SMITH, manager of the Emma mine, south of Gwinmine, Calaveras county, Cal., returned last week from a two months' absence in Ohio.

T. H. OXNAM, manager of the Palmarejo and Mexican G. F., Ltd., returned to Los Angeles, Cal., last week, from their mines in Chihuahua, Mex,

C. MCCARTHY has resigned as superintendent of the North Star M. Co. at Tonopah, Nev., to devote his time exclusively to his own mining interests.

MANAGING DIRECTOR HOLDEN of the United States M. Co. returned last week to Salt Lake City, Utah, after an absence of several weeks in the East.

W. G. LAMB of Salt Lake City, Utah, for seven years secretary of the Silver King mine of Park City, has resigned and is succeeded by J. A. Malia.

G. STAPLES, of Lake City, Hinsdale county, Colo., is superintendent of the Red Rover M. & M. Co., operating the Lillie mines near Lake City.

C. M. HAMPSON, M. E., for a number of years with the Colorado Iron Works of Denver, is now with the J. G. Leyner Engineering Works of Denver, Colo.

CHARLES BUTTERS, manager of cyanide plants in Sonora, Mex., and at Virginia City, Nev., is in San Francisco, Cal., from London, Eng., via Salt Lake City, Utah.

A. J. MCMILLAN, of Rossland, B. C., managing director of the Le Roi and Snowshoe mines, is in the East, en route to England. He expects to stay until spring.

M. NAKAOJI, mining engineer of Tokio, Japan, is in Colorado inspecting the mining and milling methods of that State. He expects to install a cyanide plant in Japan.

L. VON PERHACS, president of the American Eagle G. M. Co., Inc., operating the Marble Springs mine, near Kinsley, Mariposa county, Cal., is in New York on business.

W. L. TURNER has resigned the superintendency of the Rawhide & App M. Co., Jamestown, Cal., and will erect a plant for the direct cyanidation of sulphurets near Knights Ferry, Cal.

M. M. O'SHAUGHNESSY has returned to San Francisco, Cal., from Hawaii, from construction of an extensive tunneling scheme of 10 miles of 7x7-foot tunnel, the work on which is being done by Japanese labor.

D. G. BOLTON, for the past nine years cashier and credit man in the Denver office of Fairbanks, Morse & Co., has resigned and accepted the position of secretary and treasurer of the S. H. Supply Co. of Denver, Colo.

FRANK BRADEN, general manager for Bergheim & McGarvey, of Galicia, Austria, is in California looking over the Los Angeles and Kern county oil fields for the purpose of investigating California methods of drilling and working the oil wells.

J. C. WELCH, formerly chief chemist and assayer at the Trail smelter, Trail, B. C., and recently superintendent at the Montreal & Boston C. Co.'s plant at Boundary Falls, B. C., is superintendent of the smelter of the Le Roi C. Co. at Northport, Wash.

CHARLES T. BISHOP, formerly with Ladenburg, Thalmann & Co., New York, and late paymaster of the U. S. Naval Service, has been appointed auditor of the H. W. Johns-Manville Co., 100 Williams street, New York, N. Y.

D. G. DAVIES' engagement with the Bismarck M. Co., Sheridan, Montana, terminates November 30. As general superintendent and constructing engineer, he has installed their mine and reduction machinery, including a 600 H. P. hydro-electric power plant.

MR. IRVING H. REYNOLDS will shortly retire from the Allis-Chalmers Co. and the duties of chief engineer will be assumed by the engineers in charge of the various departments, these engineers availing themselves of the advice of Mr. Edwin Reynolds, consulting engineer of the company.

Commercial Paragraphs.

CHILDS & CHRISTENSEN succeed to the business of Childs & Hansen, analytical chemists and assayers, 127 West First street, Los Angeles, Cal.

PARKER & JAMISON, assayers and chemists, 1721 Champa street, Denver, Colo., have bought the cyanide testing plant of G. E. Alexander and will hereafter conduct a testing plant in connection with their assay business.

THE J. Geo. Leyner Engineering Works Co. of Denver, Colo., are in their new quarters in the McPhee building, Seventeenth and Glenarm streets, occupying the ground floor and basement to the right of the entrance to the building, and have 10,000 square feet of fine floor space, with handsomely furnished offices. This progressive company will put in a line of hoisting engines in connection with their compressors and drills, and propose to carry a complete line of mining machinery.

A USEFUL and handsome pocket memorandum book is issued by Arthur Koppel, manufacturer of narrow gauge railway materials, 66–68 Broad street, New York. It is shaped to fit the vest pocket. Twenty-six pages are devoted to data on various subjects, the rest of the pages are blank for memoranda. The cover is of celluloid, with a picture in the center of a standard steel side dump car, dumping to both sides, which is one of the many different styles of cars manufactured by this firm. A copy will be sent upon request, also a complete catalogue of railway materials, to all interested parties.

UNDER date of the 4th inst, the Lagonda Mfg. Co., Springfield, Ohio, are in receipt of the following letter: Gentlemen:—Our superintendent and engineers are delighted with the reseating machine. They can clean all our headers, caps and nuts on our 400 H. P. water tube boiler in about two hours, and expect to do it sooner. It is a great saving of time and a big improvement over the old way of cleaning. The important part of it is when you put back your caps you have a perfect joint and don't have a leaky cap. It is certainly a very important and useful invention for cleaning water tube boilers. Yours truly, The Ansted & Burk Co., J. W. Burk, manager.

THE Holthoff Machinery Co. of Cudahy, Wis., is extending its plant with the intent of more than doubling its former capacity and to manufacture in addition to mining machinery, boilers, pipe lines, Loomis-Pettibone gas producers and Crossley gas engines. B. Guggenheim of New York recently purchased a considerable share of the stock of the Holthoff Machinery Co. The company is now building an extension to the boiler shop 200 feet by 117 feet; also an extension to the machinery shop of about 250 feet by 110 feet; is putting in the foundation for a new foundry, and expects to have these extensions and new buildings completed early in 1904. It is also their stated intention to put in a new power plant and to have a modern built establishment, with intention of employing from 1500 to 2000 men.

Books Received.

Bulletin No. 27 of the State Mining Bureau of California, entitled "The Quicksilver Deposits of California," by Wm. Forstner, E. M., has been issued by State Mineralogist L. E. Aubury. It comprises technical and popular description of all of the quicksilver deposits in this State. The book is accompanied by maps and numerous illustrations, comprising 273 pages. Price, paper, 75 cents; 8 cents postage additional. California State Mining Bureau, San Francisco, Cal.

Catalogues Received.

Catalogue R, issued by the Mecklenburg Iron Works, Charlotte, N. C., gives good illustrated description of their various makes of mining machinery.

Catalog D, 1903, from the Blaisdoll Co., Los Angeles, Cal., gives illustrated description of the Blaisdell cyanide vat machinery, with incidental mention of the Robins Conveying Belt Co.'s machinery.

Latest Market Reports.

SAN FRANCISCO, November 13, 1903.

METALS.

SILVER.—Per oz., Troy: London, 27⅛d (standard ounce, 925 fine): New York, bar silver, 56¼c, refined (1000 fine): San Francisco, 56½c; Mexican dollars, 46@47⅛c San Francisco, 45½c New York.

During the week silver has depreciated from 59⅝c to 56½c, showing the direct effect of the withdrawal of the Government from the market as a large purchaser.

COPPER.—New York: Standard, $13.50; Lake, 1 to 3 casks, $13.50; Electrolytic, 1 to 3 casks, $13.65; Casting, 1 to 3 casks, $13.00; San Francisco: $15.00. Mill copper plates, $17.00; bars, 18@24c. London: £56 7s spot per ton.

The copper market shows no improvement. It was thought that the closing of the large producers at Butte, Mont., would cause a rising price; but as it now appears that the Butte mines are to resume, the effect on the price of the metal is not apparent.

LEAD.—New York, $6.50; Salt Lake City, $3.50; St. Louis, $4.00; San Francisco, $4.50, carload lots; 4¼c 1000 to 4000 lbs.; pipe 6½, sheet 7, bar 5½c; pig, $4.75. London: £11 16s 3d ₱ long ton.

SPELTER.—New York, $5.75; St. Louis, $5.10; London, £21 ₱ ton; San Francisco, ton lots, 6¾c; 100-lb. lots, 7c.

TIN.—New York, pig, $25.75 @ 26.00; San Francisco, ton lots, 27½c; 500 lbs., 28c; 200 lbs., 28c; less, 28½c; bar tin, ₱ lb., 30@32c. London, £115 5s.

PLATINUM. — San Francisco, crude, $18.00 ₱ oz.: New York, ingot, $19.00 ₱ Troy oz. Platinum ware, 75 @ 80c ₱ gram.

QUICKSILVER. — New York, $46.00@47.00, large lots; London, £8 7s 6d; San Francisco, local, $43@44 ₱ flask of 76½ lbs.; Denver, $49.50. Export, $42.50@43.00.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 35c; Eclipse, 37½c.

SOLDER. — Half-and-half, 100-lb. lots, 18.75c; San Francisco, Plumbers', 100-lb. lots, 15.50c.

ZINC.—Metallic, chemically pure, ₱ lb., 50c; dust, ₱ lb., 10c; sulphate, ₱ lb., .04c.

NICKEL.—New York, 50@60c ₱ lb.; ton lots, 40@47c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30@34c.

ANTIMONY. — New York, Cookson's, 7½c; Hallett's, 6¾c; San Francisco, 1000-lb. lots, 8c; 300@500-lbs., 8½c; 100-lb. lots, 10½c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, $15.85 @16.10; gray forge, $13.50; San Francisco, bar, 3c ₱ lb., 3½c in small quantities.

STEEL. — Bessemer billets, Pittsburg, $27.00@29.00; open hearth billets, $28.00 @30.00; San Francisco, bar, 7c to 12c ₱ lb.

No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2.00 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Triple tape, $3.60 per 1000 feet; double tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11c ₱ set; 14 oz., 40s., 10c.

COAL. — San Francisco, coast, yard prices: Wellington, $8.00; Seattle, $6.50; Coos Bay, $5.50; Southfield, $8.00. Cargo lots, Eastern and foreign: Wallsend, $7.50; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8.00; Cumberland, $13.00; Cannel, $8.50; Welsb Anthracite, $13.00; Rock Springs, $8.50, long ton; Colorado Anthracite, $14.00. Coke, $10.50 per ton in bulk, $13.00 in sacks; Sunnyside, $8.50, long ton.

CHEMICALS. — Cyanide of potassium, 98%–99%, jobbing, 23@24c ₱ lb.; carloads, 23@23½c; in tins, 30c; soda ash, $2.00 ₱ 100 lbs.; hyposulpbite of soda, 3@3½c per lb.; caustic soda, in drums, 3@3½c ₱ lb.; Cal. s. soda, bbls., $1.20@1.40 ₱ 100 lbs.; sks., $1.05; chlorate of potash, 12@13c; nitrate of potash, bbls., 10c; caustic potasb, 10c in 40-lb. tins; roll sulpbur, 2½@2½c; powdered sulphur, 2@3c; flour sulphur, French, 3½@3½c; alum, $2.00@2.25; California refined, 1¾@2c; sulphide of iron, 8c ₱ lb.; copper sulphate, 5¼@5¾c; chloride of lime, spot, $2.50@2.75; sulphuric acid, in carboys, 66% B, 1¾@2c ₱ lb.; nitric acid, carboys, 8c ₱ lb.

BONE ASH.—Extra No. 1, 5@6c ₱ lb. No. 1, 4@5c.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 6½c; less than 500 lbs., per lb., 7c; in 25-lb. tin pails, ¼c ₱ lb. above keg price; in 1 and 5-lb tin cans, 100 lbs. per case, ½c. per lb. above keg price. Dry Lead—In bbls., 1 ton and over, 6½c; do. in kegs, 7c.

RED LEAD.—500 lbs. and over at one purcbase, ₱ lb., 6½c; less than 500 lbs., 7c.

LITHARGE.—Pure, in 25-lb. bags, 8@9c ₱ lb.

BORAX.—Concentrated, 6@7c ₱ lb; powdered, 8@10c; fused, 20@25c; crystal, 7c; calcined, 25c.

MANGANESE.—Pure, ₱ lb., 60c.

SODIUM.—Metal, ₱ lb., $1.00.

BISMUTH.—Subnitrate, ₱ lb., $1.75.

MERCURY.—Bichloride, ₱ lb., 90c.

MOLYBDENUM.—$2.00 ₱ lb.

CHROMIUM.—90% and over, ₱ lb., $1.00.

PHOSPHORUS.—American, ₱ lb., 75c.

SILVER.—Cbloride, ₱ oz., 90c@$1.00; nitrate, 55c.

ALUMINUM.—No. 1., 99%, small lots, 37c ₱ lb.; 100 lbs., 35c; 1000 lbs, 34c; ton lots and over, 33c, Pittsburg. No. 2, 90%, small lots, 34c; ton lots and over, 31c, Pittsburg.

URANIUM.—Oxide, ₱ lb., $3.50.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

STAMP AFFIXING DEVICE.—No. 743,263. Nov. 3, 1903. J. J. Fargue and R. W. Smith, of San Francisco, Cal. All assigned to R. W. Smith. This invention relates to a device for affixing stamps to letters and packages. It consists of a receptacle or carrier for the stamps, which are contained thereon in long strips, a mechanism for withdrawing the stamps from the carrier and transferring them into a horizontal position above the point where they are to be attached, mechanism for detaching a single stamp from the strip, mechanism for moistening the surface, and mechanism for pressing the stamp upon the moistened surface.

FOLDABLE HOLDERS FOR RAILWAY FOLDERS.—No. 742,958. Nov. 3, 1903. J. L. Blair, San Jose, Cal. This invention relates to improvements in receptacles for holding railway folders, time cards, advertising cards and the like. Its object is to provide a foldable container of pasteboard or equivalent material which shall be cheap in manufacture and which may be knocked down into a flat condition for transportation. It is designed particularly as a substitute for the ordinary open-ended tin boxes used in railway depots, hotels and other places to hold folders and other advertising matter.

PNEUMATIC DEVICE FOR CLEANING CARPETS, FLOORS, OR THE LIKE.—No. 742,880. Nov. 3, 1903. A. Lotz, San Francisco, Cal. Assigned to Sanitary Compressed Air & Suction Dust Removing Co. of San Francisco, Cal., a corporation. This invention relates to improvements in means for cleaning and renovating carpets, upholstery, and like fabrics and for washing and cleaning marble, mosaic or other floors. Its object is to provide a device of simple construction in which the dirt and dust will be carried away by suction, but in which there may be a constant inflow from the surrounding atmosphere or into which there may be directed a stream of water concentrated over and impinging upon a limited portion of the area to be cleaned, the inflow from said inlet or the inflow of water coacting with the suction induced through the discharge pipe to cleanse the surface thoroughly, in the case of an air blast removing all the dust from the room, as well as from the carpet, and in the case of a water jet sucking up the water from the floor, leaving the floor perfectly dry an instant after the apparatus has passed over it.

OIL BURNERS.—No. 743,267. Nov. 3, 1903. J. Frodsham, Bouldin Island, Cal. One-half assigned to Robert Hickmott, of Ross Valley, Cal. This invention relates to an apparatus for the preparation and combustion of hydro-carbon oil. It consists of a mechanism into which oil may be introduced in conjunction with steam or heated air and a mixing chamber for these products, with a burner through which they are delivered to the point of consumption.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR THE WEEK ENDING NOVEMBER 3, 1903.

743,131.—REMOVING TIRES—H. Atwater, Vacaville, Cal.
743,373.—MEDICAL APPARATUS—E. Bachelet, Tacoma, Wash.
743,373.—MEDICAL APPARATUS—E. Bachelet, Tacoma, Wash.
742,958.—HOLDER FOR FOLDERS—J. L. Blair, San Jose, Cal.
743,055.—WATER MOTOR—L. E. Boqvist, Senttle, Wash.
742,965.—OIL BURNER—Brunner & Patterson, Haywards, Cal.
742,966.—QUARTZ MILL—J. Y. Byers, Descanso, Cal.
743,151.—BOOKKEEPING—E. E. Crandall, Los Angeles, Cal.
742,848.—SAWMILL—E. Dyer, Bandon, Or.
743,263.—STAMP AFFIXER—Fargue & Smith, S. F.
743,267.—OIL BURNER—J. Frodsham, Bouldin Island, Cal.
742,855.—HOSE SUPPORT—J. G. Garrett, S. F.
743,075.—BAND FOR CASINGS—I. B. Hammond, Portland, Or.
743,167.—LOADING APPARATUS—C. J. Ingard, Port Townsend, Wash.
743,002.—PISTOL—W. B. Knohle, Tacoma, Wash.
743,003.—BOLT CUTTER—N. Lamh, Yreka, Cal.
742,880.—CARPET CLEANING APPARATUS.—A. Lotz, S. F.
742,889.—CONCENTRATOR—J. J. Montgomery, Santa Clara, Cal.
743,310.—CHEST PROTECTOR—S. A. Moulton, Campbell, Cal.
743,019.—PIPE WRENCH—D. Nelson, Reno, Nev.
743,096.—NUT WRENCH—H. D. Pelie, Ione, Cal.
742,916.—OIL BURNER—H. L. Sherwood, Oakland, Cal.
742,944.—CAR COUPLING—G. Wiley, Vallejo, Cal.

WRITE TO US
FOR COMPETENT
TECHNICAL MEN
For all classes of work. FIVE THOUSAND POSITIONS FILLED IN TEN YEARS.
ENGINEERING AGENCY,
210 Monadnock Block, CHICAGO.

SITUATIONS WANTED.

A COMPETENT MILLMAN OF 10 YEARS' EXperience would like to take charge of a mill in any part of the country, understanding cyaniding thoroughly. Wife would like to take charge of boarding house at same place. Address W. G., care of Mining and Scientific Press.

AN ASSAYER AND CHEMIST WITH TWELVE years' experience in mining, milling, smelting and cyanide work desires a position. Best of references. Address Box 379, Central City, Colo.

CIVIL ENGINEER AND SURVEYOR, WITH thorough experience in mine surveying and mill construction, also R. R. and hydraulic surveying, desires position. Instruments furnished and references given. Address W. E. C., this office.

FIRST-CLASS STATIONARY ENGINEER; 25 years' experience in mills and mines. Address Frank Wagner, Brooklyn Hotel, San Francisco.

MINING ENGINEER AND METALLURGIST, with sixteen years of practical experience as superintendent, manager and consulting engineer of mines and mills, desires position on or after January 1st. Speaks Spanish fluently. Address P. O. Box 77, Durango, Mex.

MINING ENGINEER OF GOOD STANDING, with twelve years' experience in mines and mills, wants position as expert. School of Mines graduate. Address V. X., this office.

PRACTICAL EXPERIENCE IN METAL MINing, installing and operating steam boilers, engines and mining machinery, together with a thorough course in mining engineering at the Scranton schools, enables me to be thoroughly competent to take hold of a new property and develop it by the latest scientific mode of mining to a paying basis. Can furnish A1 reference. Open for engagement after January 1st, 1904. THEO. T. SWIFT, Muskegon, Mich. Lock Box 113.

SOBER YOUNG MAN DESIRES POSITION AS Mill Man. Has had six years' practical experience in amalgamating and concentrating, and a fair knowledge of the operation of engines. Will give best of references upon application. Address C. L. B., care this office.

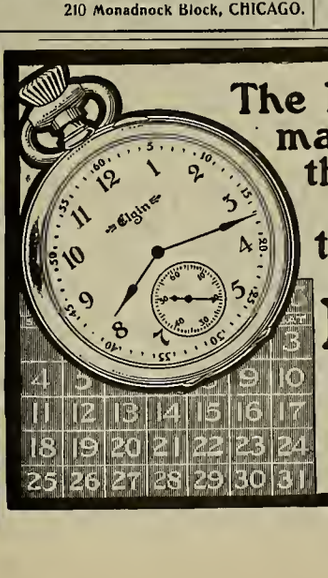
SUPERINTENDENT WANTS POSITION WITH substantial company. Practical miner, millman, assayer and cyanide expert. Address Supt., this office.

WANTED BY AN EXPERIENCED MINING Engineer and Manager, a position as mine manager in gold, silver or copper proposition, with a first-class corporation. Have had 35 years' experience in U. S. and Mexico; prefer Mexico. Speak Spanish, German, French and English. Am well acquainted with Mexico, and am employed now. Desire a change between November and January 1st, 1904. Salary expected not less than $5000 per annum. Can furnish the best of references. Address "Mine Manager," care of Mining and Scientific Press, San Francisco, Cal.

WANTED—POSITION BY AN EXPERIENCED Analytical Chemist, Assayer and Millman. References furnished. Address H. T. S., this office.

YOUNG GRADUATE OF A GOOD MINING school desires position in a mine where there will be chance for advancement. Good assayer, chemist, surveyor, and draughtsman. Address G. R., care of Mining and Scientific Press.

It Pays to be interested in the economy of your plant. If you have a steam plant you should know that the



CROSS OIL FILTER

will save you 50% in lubricating oil bills, because it cleans the oil you usually throw away as useless. Have you got the Filter? If not, send for one on trial 30 days, and if not satisfactory return at our expense.

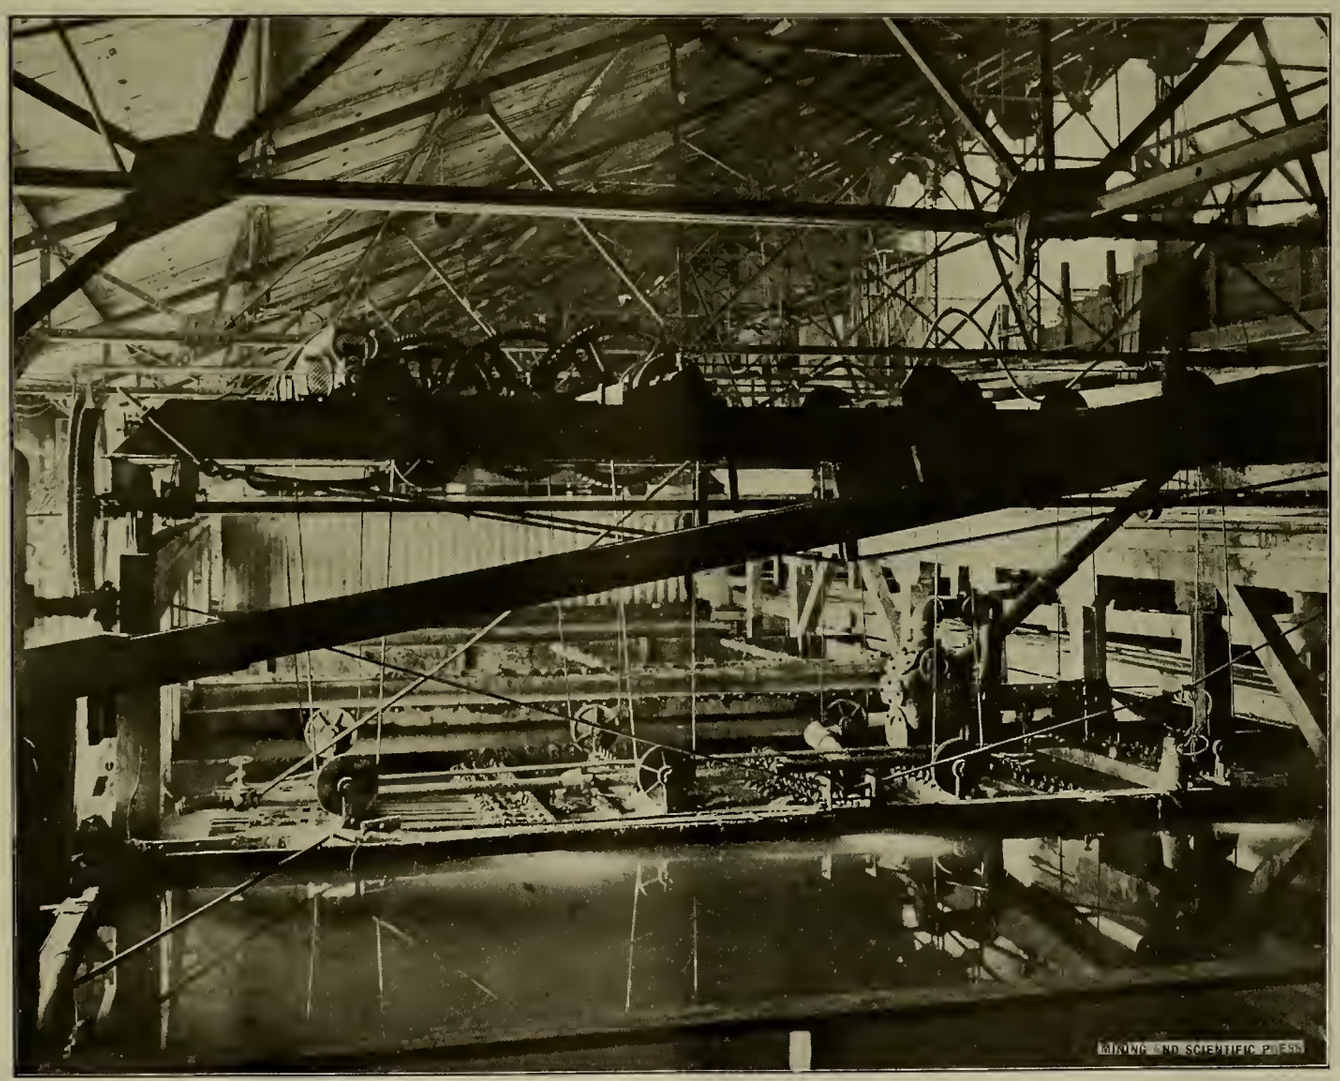
Invention in the Cyanide Process.

The cyanide process is one of the most interesting of all of those known to metallurgical science. For many years prior to its practical application in the treatment of ores it was known that dilute solutions of cyanide of potassium would dissolve minute particles of gold. Patents were taken out for a process to treat ores by this method, and since the first patents were taken out there has been a score or more of patents issued in the various countries of the world for modifications of the original process. No other process has stimulated the inventive faculties of those engaged in its practice to such an extent. The devices for the chemical manipulation and mechanical handling of the pulp are numerous, and many of these processes are successful on certain classes of ore, while others are equally so on other ores.

The one element which has presented the greatest difficulty, aside from certain base minerals contained in ores which render them difficult of treatment by the cyanide method, is the satisfactory working and mechanical handling of slimes. These are treated at the various works in a variety of ways. In one locality sliming the ore is avoided as far as possible. In another no objection is found in slimes. At one mill the slimes are separated from the sands and each class is treated separately; the former by percolation, the latter by one of the numerous schemes devised by the ingenious operators. At another mill slimes and sands are treated together and the operators report no particular difficulty. The fact that this is so, proves that the ores of various mining districts differ in a marked degree, but that this physical difference is not always perceptible to the eye.



The principal difficulty in treating slimes and sands together is reported to be due to the fact that an even distribution of the two classes of material is difficult to obtain. A slight interference in the flow of pulp into the tanks, any temporary stoppage in the supply from the mill, results in the formation of a thin "floor" of more or less impervious slimes on the bed of saud beneath. A series of such interferences usually results in producing several thin sheets in succession, intercalated with the sands, rendering percolation slow if not impossible. To overcome this difficulty various kinds of distributors have been devised and are in successful operation. Where the sands and slimes are separated before treatment the sands rarely offer any difficulty in the passage of solutions, but the slimes problem is an ever present one, and numerous and ingenious are the devices improvised and applied in attempts to successfully meet the troublesome problem.

Decantation of solutions has been successfully practiced on talc ores where the slimes were of infinitesimal fineness. By successfully is meant commercial success, though the tailings may still contain 40% or 50% of the original values. Where decantation is practiced the solutiou is clarified by the addition of lime to the charge. As a matter of course this leaves a thick sludge in the bottom, which contains gold-bearing solution. The only way in which an additional portion of these values can be economically saved is by adding weak solution and reagitating and resettling the charge, and again decanting the liquor.

To treat slimes, and also to hasten percolation, one of the first devices employed was the vacuum filter. This was arranged by building a false bottom containing the filter in a steel tank, and attaching the vacuum pump to the chamber beneath. This resulted in successful treatment of some kinds of material, but with slimes the layer on the filter generally became too thick and dense to permit a long continued passage of the solution, so the charges had to be reduced to thin sheets to hasten the operation, but this was found to greatly reduce capacity.

The filter press was next tried and in some districts this device in one or the other of its manifold forms is in successful use. In others its employment is said not to have been attended with satisfactory results. One of the latest devices is that illustrated on this page. It is simply a novel application of the vacuum pump to the treatmeut of slimes, and presents a large superficial area, which the original vacuum filters did not afford. The mechanism and operation of this ingenious method of slimes treatment are described elsewhere herein.

Experimentation is constantly in progress and newer and present unheard-of devices may be expected in the future in the practical working of the cyanide process, for the field is broad.

The Department of Mines.

The creation of a Department of Mines as a branch of the Federal Government has long been earnestly sought by several mining States of the Union, but thus far efforts in that direction have been unavailing. From the apathy of Eastern miners in this important matter it would seem that the Western miners are the only ones who realize that such a department, with its representative in the Cabinet, would be beneficial to the mining industry. The Department of Agriculture and the Department of Commerce each were the outcome of the same long-fought battle waged against strong opposition before the justice of the demands was recognized. Mining is the fundamental industry of our country. No nation can become great and remain great that has not mining as a foundation upon which to upbuild all other industries. The iron industry of the United States leads the world. Its coal, copper, gold and oil output is greater than that of any other country. The industry represents the investment of hundreds of millions of dollars. An industry so great and so deserving is entitled to recognition by the Federal Government, but there is a persistent opposition to the creation of such a department in some directions which can only be overcome by organized effort of all sections. The individual, unaided effort of a single State receives but scant courtesy when demanding from the Congress of the United States recognition in a matter so important as the creation of a new department in the Federal Government; but a united demand from the miners of the country would be recognized and would receive consideration. There are several States having organized mining societies representing the industry. Oregon has a State Association; California has three separate organizations—the State Miners' Association, the Petroleum Miners' Association and the Southwestern Miners' Association—which includes southern Nevada and a portion of Arizona. In South Dakota is the Black Hills Miners' Association, and Colorado has a Mine Operators' Association. If these Associations combine with other similar organizations and appoint delegates to a convention to make the demand upon Congress undoubtedly such concert of action would have far greater influence in bringing about a favorable consideration of this great need of the mining industry than the efforts of the States singly, which have heretofore been made. The California Miners' Association, during its sessions in San Francisco the past week, determined to abandon the effort to secure the creation of a Department of Mines, and announces its willingness to accept in lieu a mining commissioner.

Advantages of Technical Education.

In no sphere of life is the possession of technical education more advantageous or necessary than in the field of mining and metallurgy. For years and decades the practical miner, the one who prides himself upon his lack of technical knowledge, which in his vocabulary is encompassed in the one word "theory," has failed to advance. He does all things as his father and his grandfather did before him, on the general principle that that which was good enough for his ancestors is good enough for him. Within the past twenty years this old-time practical miner has been slowly forced into the background and in his place is found the technically educated man, who with a world-wide knowledge of his business is equal to almost any emergency that may arise. This is an age of progress, and in no branch of industry is it more marked than in mining. Appreciating the situation, thousands of miners everywhere are endeavoring to broaden their knowledge of the industry by reading and study, and the result is that in the mining industry there is growing up an army of men who are each year becoming more competent to undertake the various branches of their profession.

The necessity for this course is being forced upon them. Mining methods have changed materially within recent years, and so also have metallurgical methods. The miner sees this, and he realizes that it is not always the old-time miner who has introduced the successful innovations, reduced cost and increased the output, but the new miner, with world-wide knowledge and fertility of resource born of experience—not altogether his own. The Western United States, Australia and South Africa have furnished a practical school, where unusual conditions were found and had to be met—novel situations in mine and mill. The old-timer would have undertaken these varied problems in the old-time manner and he would have failed, or at best have made but moderate success. They who are not broad-minded enough to appreciate the situation and seize the opportunities that come within their reach, must surely fall behind in the race, while the more energetic will grasp these opportunities as they pass and will push onward to success. All miners cannot attend college, but they can get much valuable information from text-books, from the transactions of technical societies, and from the mining press. The papers contributed to the various technical and semi-scientific societies associated with the mining industry, form one of the best educational features of the age, and miners should not fail to avail themselves of these opportunities to inform themselves of what is going on in other parts of the mining world than that which immediately surrounds them.

DISCOUNTING the checks of the miners employed by him is one of the latest developments in the thrifty methods of F. A. Heinze, the Butte, Mont., copper miner. Formerly the miners were paid off monthly, but Mr. Heinze, evidently having the convenience and comfort of his employes in mind, decided to pay them weekly. As in the commercial world it has become the custom to deduct "2 per cent for cash," Mr. Heinze concluded to apply this idea to his employes' pay checks. They had been in the habit of paying as much as 5 per cent to the merchants of Butte for the favor of cashing their checks, which Mr. Heinze probably considered usurious, and, stepping into the breach himself, acted in the capacity of a philanthropist and deducted only 2 per cent per week. For this act of charity he was severely criticised, and, feeling hurt about it, has announced that hereafter workmen would receive their pay monthly, as heretofore. The miners' union has protested and now asks that weekly payments be resumed, and say they are willing to stand the 2 per cent reduction to receive their money weekly.

The Labor Situation.

The mining industry in Colorado is not all that could be desired under existing conditions. The organized miners seem to want to rule and not to work. In several districts idleness is forced on willing and unwilling men alike. The strike of the coal miners has caused a suspension of work in the iron and steel plants of the Colorado Fuel & Iron Co., and these idle iron workers are acting as strike breakers, going into the coal mines to work. In Cripple Creek district it is now quiet, about 85% of the miners working being non-union men. The militia have all been sent home excepting about 200. In the Telluride district signs for trouble multiply, and in view of the possible need for State militia in the coal mining districts Governor Peabody has asked that Federal troops be sent to Telluride upon the first breach of the peace. Attempts to settle the disputes in the northern coal mines of that State have in most instances failed. One of the notable incidents of the past week is in the strike of the coal miners at Castle Gate, Utah, who quit work in sympathy with their Colorado brethern. As winter is approaching and there is no large surplus of coal on hand the public will be innocent sufferers, and it is safe to say the coal miners will find little sympathy in that direction in consequence. In California the Black Oak mine in Tuolumne county remains closed, but the miners at that property, although members of the union, do not favor the action of the strangers who invaded their camp from a neighboring town, driving away the Chinese laborers, which action resulted in closing the mine. It is reported that a clash between the Black Oak miners and the outsiders who interfered is imminent.

In Arizona labor conditions remain practically unchanged, the miners and mine operators of Yavapai county each remaining firm. There are numerous mines at work in that county.

In Nevada, at Searchlight, the mines have mostly resumed and more men are daily being added to the working force. In this camp the union men have lost their strike.

IN British Columbia a decided effort is being made by the Government to force Dunsmuir to discontinue the employment of Chinese in his coal mines, the idea being that their presence underground is a menace to miners of other nations. Of this fact there is no doubt, as is well recognized in the United States, where numerous mine managers have adopted the rule that no men shall be employed underground who cannot understand and speak the English language as well. Many foreigners can understand much English before they can speak it intelligibly. The presence of this class of laborers in mines constitutes a grave danger to all who cannot understand their language, for in the event of impending danger they invariably speak to one another in their native tongue, and only by their actions can English-speaking miners become aware of the threatened peril. In previous efforts to oust the Chinese from Dunsmuir's mines he carried the case to the London judiciary, getting a decision in his favor there, since which time a new law has been passed dealing with the matter. Dunsmuir proposes to fight these renewed efforts of the Dominion Government in the same manner as before. When action is brought against him in the provincial court, he will appeal to the Dominion court at Ottawa, and, failing there, will carry the case before the judicial committee in London.

AT Fernie and Michel, British Columbia, an unusual condition prevails in a lack of a sufficient number of cars to haul away the coke manufactured there. At present 4000 tons of coke are awaiting shipment. The smelters have been well supplied with coke, but have no surplus on hand, and will soon be obliged to close unless the railroads can furnish the necessary cars. At Leadville, Colo., the production of the mines has been decreased 1000 tons daily by reason of a car famine.

CONCENTRATES.

MICA is employed in building up commutators for electric machinery. Sheets are also used for insulation.

✱✱✱✱

CHLORINATION in the Southern States is conducted at a lower cost than on the Pacific coast, owing to lower cost of labor and supplies.

✱✱✱✱

NUMEROUS nuggets of horn silver (silver chloride) were found about 1900 in placers near Antelope Hill, Yavapai county, Arizona.

✱✱✱✱

QUARTZITE, although a sedimentary rock, metamorphosed by pressure or the infiltration of silica or other mineral in solution, often contains gold, silver and other metallic minerals.

✱✱✱✱

HOISTING ROPES of hemp or other fiber is not in general use in mines, though in a few mines where the mine water contains considerable acid, which attacks iron and steel ropes, hemp ropes are used.

✱✱✱✱

THE working of gold ores by amalgamation after roasting without grinding is usually unsatisfactory owing to the fact that the gold becomes coated with a film of iron oxide or other substance.

✱✱✱✱

UNDERHAND STOPING is not commonly practiced except in small veins of rich ore. At one time it was the almost universal practice, but it was found to be more expensive than the overhand method.

✱✱✱✱

BY the proper arrangement of a mirror, sunlight may be thrown into mine workings. Photographs of tunnels have been taken by this means which were superior to those taken by means of flashlight powder.

✱✱✱✱

AT some mines the mine water is suitable for use in mills; but in others there is mineral in solution, which is detrimental to amalgamation, causing the quicksilver to "sicken" and float on the surface of the water.

✱✱✱✱

WHERE a large volume of water is encountered in driving a tunnel, it can be most effectively taken care of by constructing a covered flume beneath the track. This will permit the largest amount of water to flow away with the least amount of grade.

✱✱✱✱

THE expedient of precipitating metallic copper from mine waters containing copper in solution, on iron and tin scrap, has often been resorted to with greater or less success. The precipitating boxes and amount of scrap iron should be commensurate with the amount of water passing through them.

✱✱✱✱

WHERE native copper and native silver occur together in nature, each metal is remarkably pure, not being alloyed as might be supposed. In the Lake Superior copper region copper and silver were found associated in the early days of mining in that region. Similar occurrences are reported from southern Arizona.

✱✱✱✱

THE quantity of water per ton of ore treated in a mill where coarse concentration is practiced is variable, but is usually estimated at 4000 gallons. Where clay is present in the gangue, a larger amount is necessary than where the gangue is clean quartz. Where necessary, the water may be settled, pumped back and reused with a loss of 25% to 30%.

✱✱✱✱

IN concentration sizing by screens of variable mesh effects a separation of particles according to their relative size. In hydraulic classifiers and on the various shaking table and belt concentrators the separation is due to difference in specific gravity. A combination of the two methods usually accomplishes the most complete and satisfactory results. A plant can be arranged to accomplish this automatically.

✱✱✱✱

A DEEP MINE PUMP may be operated by steel rope from above if the pump construction admits of it. A pump rod may be placed in a shaft having a changing angle of inclination by placing a triangular "bob" at the angle of the shaft. This "bob" is set upon its apex, the two other corners being attached to the upper and lower rods respectively. By this arrangement Cornish pumps may be operated in a crooked shaft.

✱✱✱✱

BASALT is a dark, heavy basic rock, including the varieties dolerite and anamesite, the former coarse grained, the latter the medium fine grained, basalt proper, being of the fine or microcrystalline variety. Metallic minerals are seldom found in basalts. On Sulphur creek, Cal., cinnabar and quicksilver are found in the basalts, overlying fissures containing these ores, and in a few localities copper ores are found locally in basalt.

✱✱✱✱

JIGS are almost universally employed for treating coarse material, and there is a great variety of size, shape and means of operating these devices. In some—the older kind—the screen upon which the mineral rests is vibrated by direct connection with an eccentric by a rod. In later designs a plunger is operated in this manner, communicating the vibration to the screen through the medium of water, the plunger being on one side and the screen on the other of a partition. The operation of the plunger causes the mineral on the screen to be lifted slightly with each vibration, whereby the heavier particles settle through the gangue toward the bottom. The concentrates discharge either through the screen or are carried off through an opening near the level of the screen; the lighter particles, moving horizontally, pass off at the top. The jig is fed and discharges continuously.

✱✱✱✱

GOLD which is brittle cannot be manufactured into either coins or jewelry. It can be rendered malleable by the admixture of a small amount of oxide of copper, or with a mixture of nitre and borax, when the foreign metals are oxidized and pass off in the slag. Brittle gold may also sometimes be refined by melting and adding to the melt a small amount of mercuric chloride (corrosive sublimate), which converts the base metals to chlorides, which are then volatilized.

✱✱✱✱

WIRE ROPE TRANSMISSION is resorted to when the distance over which the power is to be transmitted is too great for leather or rubber belts—more than 100 feet. The speed of ropes in transmission plants should not exceed 1200 to 1600 feet per minute over small sheaves. The depression of the rope will be about 3 feet in 100 on the driving side and about 5 to 6 feet per 100 feet on the slack side. Special ropes are made for transmission of power which are less flexible than hoisting rope.

✱✱✱✱

IN some jigs a layer of coarse, heavy particles is spread over the screens to prevent a too rapid discharge of the valuable ore passing through. The number of vibrations vary with the class of material being treated, ranging from 50 or 80 strokes with coarse ore ($\frac{1}{4}$-inch diameter) to 300 to 400 with fine material. The length of stroke also varies with the number of vibrations. Jigs are usually run in series to secure the most satisfactory results. These devices are used more commonly for dressing base metal ores, and to a limited extent on gold ores.

✱✱✱✱

OBSIDIAN is a natural glass of volcanic origin. It varies in color from colorless, through shades of gray, red and brown to black, and some kinds are green. Some of black kinds owe their color to a multitude of microscopic inclusions. Some varieties contain crystals of various minerals, particularly those of mica and feldspars. Large masses of this rock are found in the Yellowstone Park. The silica present varies in the different varieties from 60% to over 80%. Pumice is a frothy sponge-like variety of rhyolitic obsidian. It is usually light in color.

✱✱✱✱

BLISTER COPPER is the product of the smelter which runs from 96% to 99% pure. It is the product of the converter. Black copper is a furnace product which results from the smelting of oxidized copper ores and may run from 90% to 97% copper. Black copper, together with copper mattes, is further purified by the work of the converter. Copper matte is the product of the furnace and contains a varying percentage of copper and sulphur together with iron and some silica. The matte usually produced at pyritic smelters runs from 45% to 60% copper.

✱✱✱✱

THE presence of arsenic in ores is often indicated to the eye of the prospector by a peculiar greenish-yellow stain to be observed in quartz croppings and at shallow depths below the surface. Where this color is observed arsenical iron sulphide is usually found in depth. In gold regions this class of ore is often rich in gold, but is difficult to concentrate. In view of this the ore should not be crushed finer than necessary, to prevent as far as possible sliming of the arsenical ores. Arsenic usually turns the amalgamating plates black, when frequent dressing becomes necessary.

✱✱✱✱

INDICOLITE is a bluish-black tourmaline. Tourmalines vary their color with their composition. The dark varieties contain considerable iron and the light kinds but little. The minerals influencing the colors are iron, manganese, sodium, calcium, potassium and lithium. Boron is present in most varieties. The colorless, greenish and red kinds usually contain lithia. The dark varieties fuse with comparative ease and the lighter with difficulty. The red varieties, when transparent and free from flaws, are of great value as gems. The finest specimens resemble rubies.

✱✱✱✱

COLORADO has a law against the use of steel or iron tamping bars, the text of which is as follows: "No person shall, whether working for himself or in the employ of any person, company or corporation, while loading or charging a hole with nitroglycerine powder or other explosive, use or employ any steel or iron tamping bar; nor shall any mine manager, superintendent, foreman or shift boss, or other person having the management or direction of mine labor, allow or permit the use of such steel, iron or other metal tamping bar by employes under his management or direction."

✱✱✱✱

IN order to get the highest possible grade of bullion, the amalgam from stamp mills should be thoroughly cleaned by grinding the amalgam in a wedge-wood mortar with abundance of quicksilver to free it from particles of metallic iron, sulphurets and other foreign substances. It should then be carefully and completely retorted. The most satisfactory results are obtained when the miner melts his gold and pours it into a bar before selling it to the mint or other buyers of gold. There is always a loss in melting the sponge gold from the retort, owing to the presence of small quantities of quicksilver and other foreign matter in the sponge.

✱✱✱✱

DURING 1902 the Mount Lyell copper mines of Tasmania treated about 1000 tons of ore daily. Besides this, a large amount of fluxes are also charged to the furnaces. The total amount treated in the company's furnaces from June 25, 1896, to March 31, 1902, was: From the company's mines, 1,160,684 tons; purchased ores, 154,923 tons; fluxes bearing metal, 33,023. Total tonnage, 1,348,630 tons. The largest gold mine in the world at present known is the Homestake of South Dakota, where about 3600 tons are treated daily. The next largest is the Treadwell mines of Douglas Island, Alaska, where the average tonnage crushed is about 4700 tons daily.

✱✱✱✱

CADMIUM is commonly associated with ores of zinc, and its presence is indicated during the extraction of the zinc from its ores by a brown-colored flame, called "brown blaze," at the beginning of distillation and before the characteristic green flame of the zinc is seen. Cadmium is more easily vaporized than zinc. If a mixture of cadmium and zinc be dissolved in dilute sulphuric acid and the solution treated with hydro-sulphuric acid gas, a bright yellow precipitate of cadmium sulphide is obtained. This, dissolved in strong hydro-chloric acid, with addition of ammonium carbonate, will precipitate cadmium carbonate, from which metallic cadmium may be obtained by distillation with charcoal.

✱✱✱✱

NO system of ventilation is without objectionable features. Furnaces are efficient to an extent commensurate with their size and volume of heated air rising from it. Fans of whatever description are not perfect. Natural ventilation afforded by connecting underground workings which have their outlet at different elevations is the most efficient and satisfactory, but not always convenient to obtain. A mine that is artificially ventilated at 500 feet depth by means of fans may be poorly ventilated at a depth of 1000 feet if the same plant be employed, for a mine can outgrow the capacity of a given sized ventilating plant, and this fact is often lost sight of in the development of a mine, and as the workings grow more extensive the ventilation steadily becomes worse.

✱✱✱✱

TWO kinds of copper oxide are known, the sub-oxide Cu_2O and the oxide CuO. A third oxide in a hydrated state is composed of four parts of copper and one of oxygen. The black oxide of copper is known as cupric oxide and contains less copper than the cuprous or red oxide. The dark blue crystals commonly seen in many cabinets and known as blue vitriol is copper sulphate or bluestone. It is manufactured by roasting copper pyrites with a free access of air, when it becomes converted in part into cupric sulphate with iron sulphate; the latter is decomposed by the heat, becoming ferric oxide. When the roasted ore is leached with water the copper sulphate goes into solution, the ferric oxide remaining undissolved. The blue crystals are obtained by evaporating the solution of copper sulphate.

✱✱✱✱

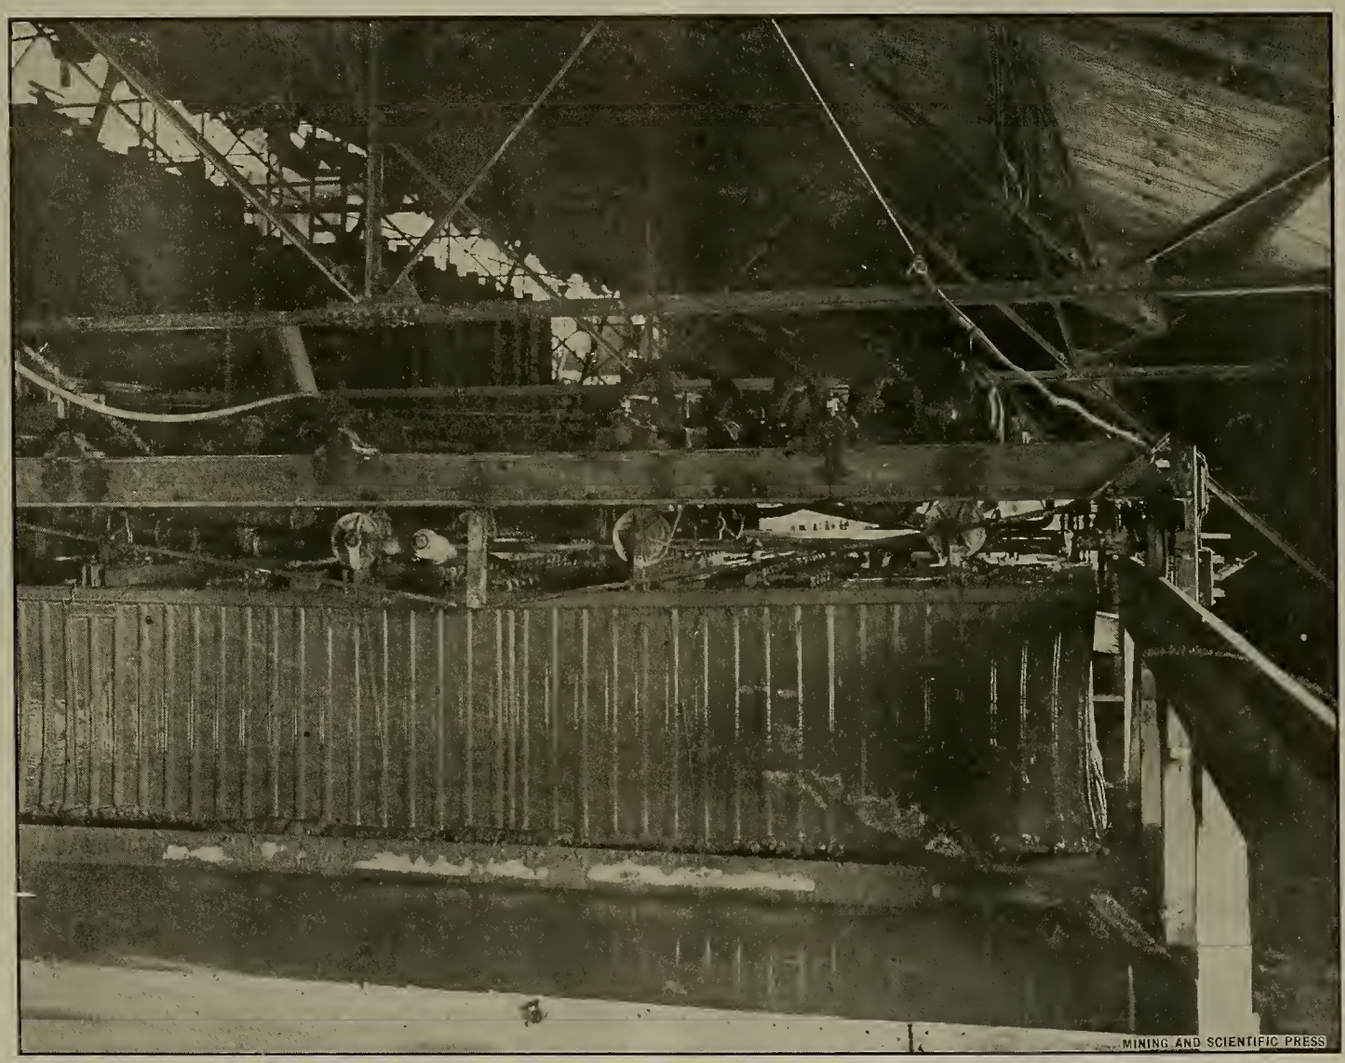
LOSSES of quicksilver in mills may sometimes be remedied by keeping the lower end of the outside plates dry—that is, not sprinkling mercury on them at all. The quicksilver escaping from above is caught on these plates. Careful mill men run the upper portion of the plates as near the proper condition (that of pasty amalgam) as possible; the central section is kept "wet"—that is, supplied with more than the normal amount of mercury—with the view to catching amalgam and gold that may be scoured from the upper section; the lower end hard, as explained above, to catch any globules of mercury that may roll down from above. While some mill men contend that a long run of plates—more than 12 feet—is unnecessary, experience shows that a long run is advisable in many mills for the purposes above indicated. In this way good plate amalgamation can be done and large losses in quicksilver lessened, if not prevented entirely.

✱✱✱✱

THE mercury traps used at the mills of the Homestake Co. in South Dakota were not all of one size. Inside traps were made of wood, with copper-lined bottom, 14 inches long, 17 inches wide and 24 inches deep, this divided into four compartments by three wrought iron sliding plates, placed parallel with its short sides. These plates are 2¼ inches apart, the center one extending to the bottom of the box, the others reaching within 3 inches of the bottom. The pulp flows under the first compartment, over the middle one and under the third one, flowing out through a launder built into the side of the box. The trap on the outside is larger. It is also of wood, is 48 inches long, 14 inches wide and 48 inches deep. It has three partitions set 10½ inches apart, reaching from the bottom of the box up to within 1½, 3 and 4 inches below the level of the inlet, the outlet being 6 inches below the inlet. In the middle, between two wooden partitions, is let down a sliding wrought iron plate ⅜ inch thick, reaching to within 3 inches of the bottom of the box. At the Caledonia mill the traps are much smaller, having one trap for each battery of five stamps. The size of traps must be proportional to the amount of material passed through them within a given time.

The Moore Process at the Consolidated Mercur Gold Mines.

Written for the MINING AND SCIENTIFIC PRESS by GEORGE MOORE.



This process was designed by the inventor to meet a difficulty almost universal, or at least international, in the cyaniding of ores; that is, the slimes difficulty by which probably 90% of all ores are seriously affected. The methods at present in vogue for the treatment of slimes are crude in the extreme, the decautation and the filter press methods being the only ones heretofore attempted in a large way. Both of these have very serious objections and both are useless for low-grade ores. The filter press method has largely displaced decantation and is, especially in South Africa and Australia, very extensively in use. In both of these countries the ores are of a sufficient value to stand the cost of operating and the loss by imperfect washing. In this country most of the larger gold mines produce ores of such low grade that the use of filter presses or of the decantation method is simply out of the question.

The writer had full experience in the operation of filter presses at the Sunshine mine, where the ore averaged less than $3 per ton, and there encouutered the difficulties with which every filter press operator is familiar, that is, the cost of manipulation and the imperfect washing of the gold solution from the cakes. There were four three-ton presses, and the labor cost of operating was 60 cents per ton of slimes, while an average of 40 cents of soluble gold was left in the cakes. The latter difficulty is due to the fact that in filliug it is impossible to preveut a partial separation of the coarser slime particles from the finer. Thus the resistance to the flow of wash water varies in different parts of the cake and the water naturally takes the course of least resistance and a large part of the cake is not washed. To overcome this difficulty operators in South Africa resort to "double filter pressing," that is, they stir the cakes from the first press into an emulsion with water or solution, and repeat the filteriug operation. This of course doubles the operating cost, already too high.

The accompauying illustrations show some of the Moore process filters in operation at the Consolidated Mercur mill. The filters consist of a series ot parallel plates 4 inches apart. Each plate is 20 feet long and 4 feet high, and is simply a light frame work with canvas on both sides. A suction pipe passes through the top at the center down to within a half inch of the bottom, while two blowing pipes also enter at the top, each one half way between the center and ends, and exteud barely through the top. Eighteen of these parallel plates are firmly attached to channel irons crossing their tops, thus forming one "basket" of filters, that is, one unit. We thus have in one machine a total filtering surface of 2880 square feet. On top of these plates, and connected to their suction pipes by a 3-inch cross header pipe, rests a 5½-inch and 8-inch by 7-inch vacuum pump of the Dean patteru. The whole basket hangs by eight wire cables from an electric crane which raises aud lowers the basket and carries it from one compartment of the tank to another. This tank has three compartments, containing slimes, weak cyanide solution and wash water. Just beyond the wash water compartment is the discharge point, simply an open space under which the tailings cars stand to receive their load.

In operation, the filter basket is lowered in the slimes compartment and the vacuum pump is started. The slimes are agitated to prevent settling. After the suction has proceeded from one to two hours, varying with the character of the slimes and with the thickness of the emulsion, there is a coating of slimes on all parts of the filtering surface of from ¾ inch to 1 inch in thickness, representing from nine to twelve tons of slimes, dry weight. During this time the pump is continuously discharging the clear gold solution. The motor on the crane is then started and the basket with its load is lifted out of the slimes compartment, this operation requiring forty seconds. The crane is then moved along its track until over the weak cyanide compartment and the basket is lowered. Twenty minutes in this tank and ten minutes iu the wash water tank is sufficient for a complete displacement of the valuable solutions. During all this time the pump is in operation and the vacuum produced prevents the cakes from dropping off during the transferring. Having arrived at the discharge point the vacuum pump is stopped and a blast of air turned in to a pipe connecting with the blowiug pipes of each plate. The air passing through the cloth from within the plates dislodges the waste slime cakes, and, deprived of all their soluble gold, they drop at once into the cars below, so that from nine to twelve tons are discharged and loaded in about a minute. Each filter handles about seventy-five tons per day and one man operates the four filters, so the cost of labor is about 3 cents per ton. The wear on the cloth is almost nothing, cloths in use six months in the experimental plant showing no deterioration. The power required is very small, a 7½ H. P. motor does the raising of the basket and is in operation only four minutes during each cycle of two hours. The vacuum pumps are run by air and hold a vacuum of from 18 inches to 20 inches of mercury. The discharged solution is as clear as spring water.

The advantages of this system are obvious; first, a saving of from 40 to 60 cents per ton in labor; second, a saving of a like amount in extraction; third, a saving of over 50% in the cost of installation. The saving on extraction is due to the fact that, while the filter is in the slimes tank and the suction in operation, an equalizing action is taking place rendering all parts of the cake of equal resistance to the flow of solution and wash water, so that when placed in the washing tanks a perfect displacement of solutions is accomplished. For example, we might consider that it would be possible for one spot on the 2880 square feet of slime cake to have more of the coarser slimes, or fine sands, than the other parts; then there would be less resistance to the flow at this point; therefore, the flow would be accelerated here, the slimes would be brought up and would cover this point more rapidly than the other parts until, by this increased coating, the resistance to the flow would become the same as at all other points. This equalizing influence is, in fact, so continuously in operation that at no instant is there any less resistance to the flow at one point than at all other points. Thus, when lifted out from the slimes compartment, the entire basket of filters is in perfect condition for washing, and, in practice, we extract all of the soluble gold.

Interior Mercur Mill, Tooele County, Utah, Showing the Moore Filter in Act of Transportation.

At the Consolidated Mercur mill all of the ore is first passed through revolving cylinders where the slimes are washed from the sands. By this operation the benefit to the sands, as shown in the extraction, fully equals the benefit to the slimes; for, consisting only of the coarse granular particles, percolation is carried on rapidly and better displacements and washings accomplished. The tailings from both the sands and the slimes are assaying from 40 to 45 cents, a saving of 80 cents per ton over the old system, which on 1000 tons per day is a heavy item.

At the Dexter mine at Tuscarora, Nev., slimes

which have been considered so rebellious that they had not been treated by any existing systems are now being handled by this process, the tailings often carrying only 20 cents per ton in gold. Experiments carried on in the Black Hills indicate that the slimes there can be treated very rapidly, cakes ¾ inch thick having been built up in ten minutes. A 100-ton plant is now being built by the Allis-Chalmers Co. for the Buxton & Big Bonanza property in that district.

Equipment of the Sultan Mine, Arizona.

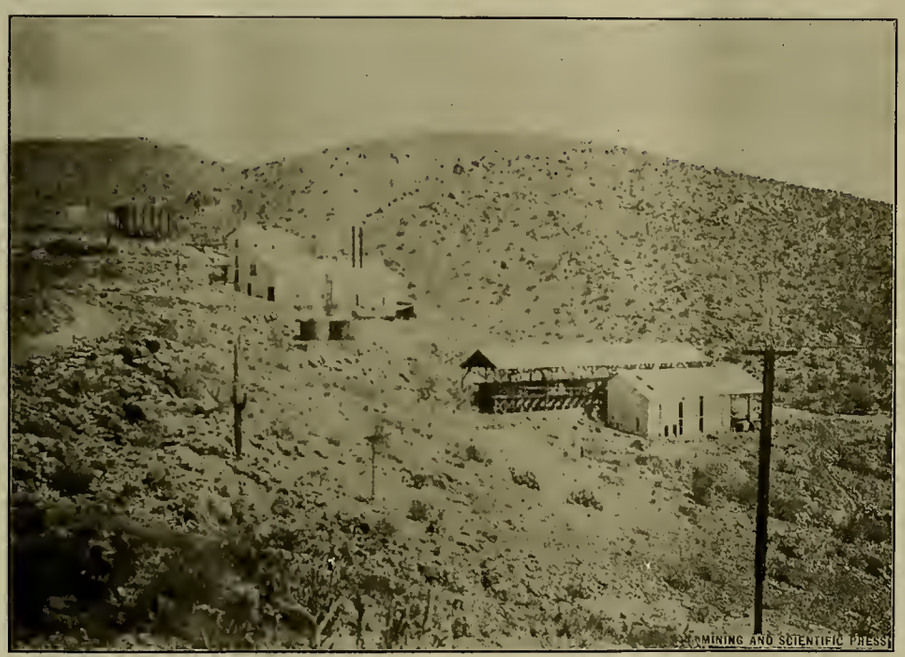
NUMBER II.—CONCLUDED.

Written for the MINING AND SCIENTIFIC PRESS by CHARLES E. BUNKER, Construction Engineer.

The water supply for the mine, mill and cyanide plant is developed on the Santa Maria river by sinking a shaft on the bank of the river 56 feet deep, from which a drift is run horizontally directly across under the river bed for a distance of 270 feet, and below the bed from 10 to 15 feet. The drift cuts through sand, cement, gravel and conglomerate waste, and is of sufficient size to form a large reservoir. It may be well to state that the rivers of southern Arizona are dry at certain seasons of the year, due to the immense evaporation; however, in this particular case, the sand beds are thoroughly saturated with water, and it was due to the latter fact that it was possible to develop a sufficient water supply. Thirty-seven feet below the collar of the shaft is a station 7 feet 6 inches wide by 7 feet 6 inches high by 12 feet long. In this station is situated a 6x10-inch Stilwell-Bierce & Smith-Vaile triplex hydraulic pump with a 20 H. P. electric motor to operate it, which runs at a speed of 600 revolutions per minute, and is geared to the pump so as to drive it at a speed of forty revolutions per minute. This is an inductiou motor with "squirrel-eage" armature, and is connected up with a starting compensator and oil-break switch. The pump and motor are on one bedplate, which rests on a concrete foundation.

The current is conducted from the generator at the power house through three No. 8 iusulated copper wires at a tension of 2500 volts, to three transformers at the well house where the current is transformed down to 600 volts. Thence it is conducted to the pump through the uecessary fuse blocks, switches, etc. The three cylinders are on one bed plate. The plungers are directly connected to one shaft with cranks set at an angle of 120°. The capacity of the pump is rated at 150 gallons per minute.

The water is conducted to the mill tanks, a distance of 1 mile, and a differeuce of elevation of 500 feet, through a 6-inch spiral iron pipe, connected with shoulder bolted joints. The well will furnish about 80,000 gallons of water every twenty-four hours for a period of three to five hours.



The cyanide plant is under two roofs—the leaching tank and filter press building in one, and the precipitating room, pump room, retort room and assay office in the other. The upper building is 150 feet long and 30 feet wide, open on all sides and roofed with No. 26 corrugated irou. The lower building is 90 feet long and 40 feet wide, enclosed on all sides and roofed with corrugated iron. The solutiou tanks are not under cover. The tanks throughout the plant were shipped "knocked down" and erected by tank riveters on the foundations on which they rest.

The plant consists of a strong and weak solution tauk 10 feet in diameter aud 14 feet deep, each with a capacity of 11,500 gallons, or forty-seven tons of solution; five leaching tauks each 24 feet in diameter and 5 feet deep, the capacity of each about sixty tons; two gold tanks, each 10 feet in diameter by 6 feet deep; two solution sump tanks 10 feet in diameter by 4 feet deep; two agitating slimes tanks 10 feet in diameter by 12 feet deep; one cleau-up tank 4 feet in diameter by 3 feet deep, and one 15,000-gallous capacity water sump tank; also a pressure tank, or montejus, 42 inches in diameter by 12 feet long for charging the filter presses, two filter presses each with a capacity of twenty-oue 36x36x3 inch cakes; one Stilwell-Bierce aud Smith-Vaile 3x5x7 solution pump; one 6x4x6 duplex vacuum pump, a Fairbauks-Morse duplex 6x4x6 pump, for pumping back clear water from the sump tank, and washing the cakes in the filter presses, and two double-compartment iron precipitating boxes with twelve compartments each.

Each leaching tank is provided with four bottom-discharge gates; an automatic filling distributer, and an overflow launder around the top of the tank. The filter frame in each tank is made of 1¼-inch square strips laid 1 ineh apart at right angles aeross 1x3-inch strips spaced 15 inches apart on the bottom of the tank. These wooden gratings are made in four sections, and fit within 1 inch of the inside periphery of the tanks. Over the bottom strips are stretched the eanvas filter cloths securely held at the sides and openings by 1-inch rope — around which the canvas cloth is rolled—and both are driveu tightly between the tank side and gratiug. On top of the eanvas filter is placed a filter of cocoa matting for the protection of the lighter cloth. Below the leaching tanks extend three wooden launders for dis-

tributing the wash water and the strong and weak solutions to their respective reservoirs. The water, air, and strong and weak solutions are conducted through the plant through 3-inch iron pipes.

The precipitating-room is 36x40 feet in size, and divided into three floors. The strong and weak gold tanks are on the upper floor, and the two sump tanks are on the lower floor. Above and extending over the sump tanks is the zinc precipitation box floor, 20 feet by 36 feet, covered with linoleum. The zinc boxes are double-compartment iron boxes with twelve compartments each. Attached on the lower side of each box are the slimes launders for removing the zinc slimes at clean-up. Covering these launders are hinged sheets of iron provided with hasps and staples for locking them down. On the sump-tank floor is the clean-up tank into which pipes lead from the slimes launders. The precipitating room is ceiled throughout with double beaded ceiling, and is lighted by skylights and double windows.

The surface equipment of the Sultan mine is one of the most complete in the country, and has been highly commended by mining men who have visited the property. That the Sultan mine, after years of "ups and downs," is on the eve of a success which will place her among the list of bullion producers, there seems little doubt.

The Sultan mine stands as an object lesson to others of what may be accomplished in the desert of Arizona when mining is undertaken with enterprise, capital and ability.

Consumption of Zinc in Cyanide Plants.*

NUMBER IV—CONCLUDED.

Written by WALTER H. VIRGOE.

Table No. 4 shows half a dozen experiments illustrating this point.

standpoint, a glance at the figures showing the chemical losses of zinc on any cyanide plant are quite sufficient to prove that the accumulation of zinc in cyanide plant solutions is not limited by the deposition of zinc as $ZnCy_2$, for the loss of cyanide involved by such reaction would be enormous.

Referring to the preceding figures, it will be observed that on the sands plant there was a chemical consumption of 1201.9 kilos, or 2644 pounds avoirdupois in four months. Assuming this zinc to be thrown out as the single cyanide of zinc, a loss of cyanide is involved of 5288 pounds, or about 2 pounds of KCN per ton of ore treated.

On the slimes plant the chemical loss was 288.7 kilos, or 635.14 pounds, and as 1481 tons were treated, this means a cyanide consumption of .85 pound per ton.

Inasmuch as the average consumptions on the two plants are about 1.5 pounds and .6 pound, respectively, we note how very unsatisfactory this attempted solution of the problem is.

If the figures be taken from another plant treating chloridized ore in the territory of Tepic, Mexico, over a period of two months, as follows, interesting data upon this point are afforded:

Tonnage treated, 3174.4.
Cyanide consumed, 4890.6 pounds, or 1.54 pounds per ton.
Zinc consumed, 3816.5 pounds, or 1.20 pounds per ton.

	Pounds.
Weight of raw product produced	6441.38
Weight of fine bullion produced	5265.09
Difference	1176.29

An analysis of the product showed that it contained 6.85% of zinc; hence, 444.23 pounds of zinc were cleaned up in the product during the period of two months, and since the total amount of zinc used was 3816.5 pounds, the chemical loss must have approximated 3372.27 pounds, which, if thrown out of solution as $ZnCy_2$, would have entailed a further cyanide consumption of 6744.54 pounds.

TABLE NO. IV.—TABLE SHOWING THE EFFECT OF THE ADDITION OF ZINCIC-POTASSIC-CYANIDE TO ORDINARY CYANIDE SOLUTIONS IN LABORATORY TESTING WORK.

Test No.	Weight of Ore, grm.	Weight of Sol'n, grm.	Reagents Before Use. KCN, %	KCN as $ZnCy_2$, per cent.	Total KCN per cent.	Reagents After Use. Total KCN, %	Cyanide consumption, lbs.	Heads. Au	Ag	Total	Tails. Au	Ag	Total	Per Cent of Extraction. Au	Ag	Total	Remarks.
1.....	500	500	.40	.00	.40	.36	.8	$11 16	$1 73	$12 89	$1 86	$0 74	$2 60	83	57	79.8	In tests Nos. 1, 2, 3, the solutions as they drained off the ore were passed through zinc. The material treated was a very pure quartz ore in each case. The tests Nos. 4, 5, 6, the effluent solutions were not passed through zinc.
2.....	500	500	.35	.05	.40	.39	.2	11 16	1 73	12 89	2 27	77	3 04	80	55	76.4

NOTE.—These tests represent results of leaching experiments conducted on a basis of four days' treatment.

The charges, which were placed in glazed leaching jars, were under percolation for four days. The solutions that come off tests Nos. 1, 2 and 3 were allowed to drip into a small flask of zinc shavings and drip by overflow into a glass beaker. The solutions from tests 4, 5 and 6 were not passed through zinc. This probably accounts for the consumption in the first three tests being smaller than in Nos. 4, 5 and 6.

The data furnished by this sheet serve to indicate that the presence of zinc-potassic-cyanide in solution tends to greatly reduce the consumption. Tables Nos. 1 and 2 are also interesting in this respect.

One of the most interesting problems in cyanide work is the question relating to the deposition of zinc from plant solutions. I believe the generally accepted idea is that the zinc is thrown out as $ZnCy_2$ 2KCy, and this I observe is the theory advanced by Schnæbel in his book on "Metallurgy," Vol. 1, page 835, where he gives the following equation:

$$2\,H_2O + Zn\,(NaO)_2 + K_2ZnCy_4 = 2\,ZnCy_2 + 2\,NaHO + 2\,KHO,$$

and adds: "These reactions limit the accumulation of zinc in the solution."

The author does not believe such a reaction does take place, nor that any reason exists why it should take place. On a cyanide plant more zinc will be found in the strong solutions than in the weak solutions, and it would appear that there is no chance of $ZnCy_2$ being thrown out in a strong solution of cyanide, or, in fact, in any solution containing free KCy; neither is it to be expected that $ZnCy_2$ would be thrown down in a strongly alkaline solution. The author questions whether $ZnCy_2$ is ever actually thrown out of a cyanide solution in practical operation, for, presuming that the solution contained no free cyanide, and that all the free alkali was being used to hold zinc hydrate in solution, or in other words, was used to form that very unstable compound, zincate of potash, we should still have this further reaction to fall back upon:

$$Zn\,K_2O_2 + 2\,Zn\,Cy_2 + 2\,H_2O = 2\,Zn\,(OH)_2 + ZnCy_2.2KCy.$$

Moreover, looking at the matter from a practical standpoint, it is unnecessary to produce further data to prove the fallacy of the supposition of the deposition of zinc from solution in this way.

The author has observed that solutions of KCy containing zinc that have been in contact with ore, with which lime has been mixed, will gradually deposit in the sump tanks a quantity of light, white precipitate which forms first as a scum on the surface of the solution, and which consists of lime and zinc, perfectly free from combination with cyanogen. This precipitate consists of carbonate of lime and zinc, and since precipitated carbonate of zinc is soluble in an ordinary solution, the author has little doubt but that the salt thrown out is a compound carbonate of zinc and lime, which is insoluble, and which is formed by the action of the carbonic acid gas of the atmosphere. This precipitation of zinc on a plant will be taking place not only on the surface of solutions in the sumps, but also in the solution exposed to the atmosphere on the charges under treatment in the leaching tanks, and affords the true reason for the non-accumulation of zinc in solution.

The following equation probably describes the reaction that takes place:

$$ZnCy_2\,2KCy + 2Ca(OH)_2 + 2CO_2 = ZnCa(CO_3)_2 + CaCy_2 + 2KCy + 2H_2O.$$

We see, therefore, that lime appears to play a very important part in keeping cyanide solutions free from zinc. A discussion of the advantages in other directions does not come within the scope of this paper, but it may be pointed out that its presence in solutions prevents the existence in solution of alkali carbonates or bicarbonate of lime, which so frequently gets thrown out in the zinc boxes as carbonate owing to the action of the generated potash if the solutions are deficient in alkali, which is liable to be the case where plant solutions are made up with water heavy in bicarbonate of lime. The author has known cases of zinc box screens becoming clogged with this deposit of lime, and even cases where the precipitate was caked from this cause and only removed with difficulty from the boxes.

One matter suggests itself with reference to zinc-box metallics: Since the solution and precipitation of zinc from a cyanide solution in practice does not involve any loss in cyanide, it might prove to be an economical matter in a plant producing few metallics to replace these metallics in the boxes on trays, placed horizontally so that the solution can flow beneath and above them; these metallics should gradually dissolve, and by this means the production of material requiring the expense of acid treatment might be avoided.

The question whether zincate of an alkali can exist in the presence of free KCy is interesting. In a paper read before the Colorado Scientific Society in April, 1895, N. Andersen states that it does not exist and that the following reaction takes place:

$$Zn(OK)_2 + 4\,KCy = ZnCy_2.2\,KCy + 4\,KHO.$$

Again, Alfred James, in discussing a paper entitled "Notes on Residual Cyanide Solutions, and a Method of Examining Them," published by Chas. Ellis, in 1897, gave some evidence in support of the above reaction taking place. There appears to be no evidence tending to the contrary, and Andersen's equation is probably reliable. Consequently, a plant chemist may be safe in regarding the zinc contents of his plant solution present as zincic-potassic-cyanide, provided the results of titration with excess of soda show that there is sufficient cyanide in solution to permit of the zinc being in this condition, and, therefore, by deducting the amount of cyanide necessary to convert the known amount of zinc present into zincic-potassic-cyanide from the amount shown by titration with excess of alkali and the indicator, the amount of free cyanide is known.

This examination of a plant solution should be made every few days—at the very least once a week; many operators would then become alive to the fact that they are using zincic-potassic-cyanide alone as a solvent, and would understand why their extractions, especially in the case of silver, are lower than they should be. More especially is this likely to be the case with dilute slimes plant solutions, which solutions are in need, if anything, of more careful watching than strong solutions because, being very dilute, it requires but the solution of very little zinc to convert all the free KCy into zincic-potassic-cyanide, and the further solution of zinc can only occur as a zincate of an alkali, and it can be very well understood that the addition of free cyanide to such a solution must first convert this zincate of alkali into a double salt before the solution can contain any free cyanide at all.

Where poor precipitation from slimes plant solutions occurs it is necessary to know whether there is enough free cyanide in solution to dissolve the zinc hydrate produced by electrolytic action on the surface of the shavings in the boxes, and the addition of free cyanide is absolutely no criterion that this is the case.

An excess of alkali in the form of lime is absolutely necessary in all solutions, and sump tanks should be wide and shallow, rather than narrow and deep, and not so closely covered in as to prevent the free access of the atmosphere. In estimating zinc in a cyanide solution, it is preferable to decompose the solution with HCl and boil off the HCy fumes before evaporating to dryness, because if this be not done the zinc contained in the evaporated residue is found to be in an exceedingly insoluble form, being in combination with some organic acid resulting from the decomposition of the cyanide solution during the evaporation, and requires careful and long digestion with concentrated sulphuric acid before it can be all made to dissolve.

*Jour. Chem. Met. and Min. Soc., S. A. (Condensed.)

Determination of Gold and Silver in Cyanide Solutions.

TO THE EDITOR:—Those who have occasion to assay cyanide solutions in order to determine the amount of gold, silver, etc., in solution, will find that the following method will greatly facilitate their operations:

Draw off 100 to 500 c. c. of the cyanide solution.

Place some sawdust or porous cotton in an iron pan or any convenient iron vessel.

Pour the solution gradually upon the sawdust and allow it some time to be absorbed by the latter.

Apply heat gradually to the iron vessel until all the solution is evaporated and the sawdust reduced to carbon. The residue, mixed with the proper fluxes, is transferred into a crucible and then assayed in the ordinary way. Should the volume be too large, it can be quartered down.

Should it be desirable to make an estimation for the base metals, the same can be made volumetrically or gravimetrically, with the precaution of washing the carbon with distilled water.

This simple method of absorbing the cyanide solution offers the advantage of being rapid and enables the operator to treat a larger volume of solution, which is important, as the percentage of gold in a small amount of solution is in most cases so minute that it can only be found as a trace, which renders the assay practically valueless, so far as quantitative determination is concerned, because this trace of gold could only be calculated by redissolving the gold in aqua regia and applying the sensitive "Cassius-color" test, with which not all assayers in this country are familiar.

The above-described method is not claimed as a scientific discovery, but may be appreciated by practical cyanide operators in America.

ROBERT GRAUER, Metallurgical Chemist.

Shaft Sinking and Equipment at the Ashland Mine.*

NUMBER II.—CONCLUDED.

Written by H. F. Ellard.

Stockpiling.—When stocking ore, one of the chutes above mentioned is reversed so that the ore is discharged into two cars on parallel tracks. These run to two trestles, 60 feet apart, and are propelled by a haulage plant of the "four-loose-reversible-drum" type, situated in the engine house and connected to the cars by ropes and sheaves in the ordinary way.

The cars are automatic as to the opening and closing of their doors. They have a capacity of four tons each, at a speed of 1000 feet per minute. They are operated independently, but by one man. A suitable indicator on the haulage plant shows the position of both cars at all times, and both cars may be propelled in either direction at the same time.

Sinking.—Ground was broken Sept. 23, 1901, and has been carried on at intervals since that date. The shaft was completed to the 13th level, a distance of 1032 feet, on June 30th last. The work during the first few weeks was tedious, owing to an excessive raiufall and consequent caving of the hanging side, and to the customary delays in getting timber, hoist, headframe, buckets, etc., in position for work. Our pumping charges were very light, only thirty gallons of water per minute being handled in addition to the occasional floods above mentioned. Once fairly started very fair progress was made. The timbering was very carefully done, one wall plate only was broken by blasting, and the shaft presents a thoroughly workmaulike appearance. No serious accidents and no fatalities occurred during the progress of the work. For the first 87 feet sinking was carried on in the regular way. Four miners were employed on each shift, and they drilled, shoveled or timbered as was required. They worked eight-hour shifts and were paid $2.50 per day.

Below this point with the exception of 47 feet included in three winzes the entire length of the shaft was penetrated by raises. These were about 6x6 feet in size, and placed as nearly as possible in the center and toward the foot-side of the shaft. There were six of these in all, varying in height from 112 to 200 feet.

The customary chutes at the bottom of the raises were dispensed with, and floors and openings the full width of the rock compartments were maintained to allow free discharge of the coarse rock. A pole across the opening served as a stop in each case.

It was necessary to put in six crosscuts from the old workings to the line of shaft, a total distance of 1037 feet. In addition to the sinking crew two other gangs were employed most of the time, one raising and the other preparing the crosscut on the level below.

Until the shaft went into commission, July 1, 1902, a foreman, our regular timber boss from the mine, spent most of his time at the work and looked after the framing and placing of sets, the moving of pumps, the care of tools, supplies, etc. After this time the work was carried on continuously, one, two or three shifts being employed as conditions at other points warranted.

The sinking and timbering were done on the "Company Account" plan, the drifting and raising were done by contract.

Two Ingersoll-Sergeant rock drills, 3½-inch cylinder, were used. The air pressure was generally from 80 to 90 pounds, and 1¼-inch air hose was used. From 20 to 24 holes from 10 to 14 feet in depth were drilled for each cut and 50% powder was used exclusively. Ammonia powder was used in raises and at all points where the ventilation was poor.

Progress.—The work was necessarily carried on in sections, and in most cases very satisfactory results were attained.

The following table gives a summary of the work by sections, giving the length of same, the force employed, the time required to complete, and the time lost by sundry causes. This last item refers to the time lost by the entire force employed on one shift.

*Trans. Lake Superior Mining Institute.

Cost.—The following statement shows the cost of the work:

	Per Foot— Labor.	Supplies.	Total.
Sinking and stripping down	$12 15	$1 05	$16 20
Raising	6 19	1 64	7 83
Timbering	4 00	8 38	12 38
Skips, cage and ladder roads	1 74	2 45	4 19
Miscellaneous charges*	1 06	1 07	2.13
Total	$25 14	$17 59	$42 73

* Including cost of temporary hoisting equipment and underground ore pockets.

SUMMARY OF SUPPLIES.

	Per Foot.
Explosives	$2 60
Iron and steel	1 31
Pipe and fittings	18
Timber and lath	8 15
Steel rails	1.50
Miscellaneous supplies including fuel and air	3 52
Total as above	$17.59

The sinking and raising accounts include the cost of handling the material on the levels, hoisting and disposing of it on surface; also cutting out the plats on the levels. The timbering account includes the cost of timbering the plats (stations).

It will be noticed that the timbering is a very expensive item, and I give herewith the cost of materials for one complete set:

MEMORANDUM OF COST OF TIMBER FOR NO. 9 SHAFT, ONE SET.

	Feet, B. M.		
2 pieces 12x12-18 pine	432		
2 pieces 12x12-12 pine	288		
1 piece 12x12-16 pine	192		
Total	912 at	$19 00	$17.33
2 pieces 10x12-10 tamarack	300 at	13 50	2.70
1 piece 6x12-12 tamarack	72 at	13 50	97
1 piece 4x12- 5 tamarack	20 at	18.00	36
2-inch hemlock	545 at	11 50	6.27
2-inch tamarack	180 at	14.50	2.61
250 wedges, each		01¼	3.13
1 cord soft wood			2.25
			—$35 62
65 pounds 1¼-inch iron		$2 00	$1 30
35 pounds 1¼-inch washers		1 85	65
13 pounds 1¼-inch nuts		04½	68
10 pound spikes		2.45	25
			— $2.88
			— $38 50

To this we have to add the framing, teaming and shop labor, amounting to approximately $10 per set, making a total charge on the surface of $48.50 per set.

There are 198 sets of this size, and seventeen sets of 14x14-inch timbers in all, the heavier timbers being used in the more treacherous ground near the surface.

To S. R. Elliot, engineer, and Captain G. A. Andersou, in charge of the work, much credit is due for the accuracy and excellence of the work performed.

SUMMARY OF THE WORK ON SHAFT No. 9, GIVEN IN SECTIONS.

SECTION.	Length, feet.	Force, Men.	Employed Shifts.	Time to Complete, Weeks.	Time Lost, Hours.
1. Sinking from surface	87	13	3	9	101
2. Raising from 2d level	125	4	2	6	28
3. Stripping down and timbering to the 2d level	135	13	3	6	12
4. Raising from 5th level	143	4	2	9	16
5. Stripping down and timbering to 5th level	143	3	3	6	20
6. Sinking winze below 5th level	20	6	3	1	12
7. Raising from 7th level	129	4	2	7	8
8. Stripping down and timbering to 7th level	153	13	3	5	..
9. Raising from 8th level	110	6	3	20 days	..

Copper Resources of China.

When we cousider the available supply of copper, says Electricity, it would be interesting to find out what place China usually occupies as a possible future source to draw upon; yet it is known that, amoug many other valuable mineral deposits in that mysterious country, copper is not by any means the least important, although its production has beeu developed by only the most restricted aud primitive means.

The usual manner of getting ore has been to follow a lode from the surface into the ground as long as possible without going to the expense of siuking a shaft or making a tunnel. The miuers have usually been left to do as they please uuderground, Government officials and private capitalists considering it beneath their diguity to explore the caves dug at their expense or order. The miners have, as a rule, been treated badly, aud have taken their reveuge by trying to ruin them—usually by gettiug out only the very poor ore, until the capital invested is exhausted, and leaving columns of best-paying ore standing, which they usurp for their own benefit after the mines have been abandoued.

Copper is abundant in Ho-hoi Hsien, Wu-ting Chih-li Chow, Wei-hsi, T'ing, Yung-chang Fu, K'ai-hua Fu and Tung-ch'uan Fu, which has the richest deposits of copper in any part of Yunnan. Indeed, blocks of pure copper are said to exist in the last-named locality, which have defied all the ingenuity brought to bear on them for ages to demolish or remove. Japanese miniug experts are uow beiug introduced into these localities and the deposits are rapidly being reduced to marketable metal.

The copper deposits in Chao-tung Fu are immense. Many mines have been opened and worked.

The Development of Water Powers.*

Consulting engineers are in the habit of estimating water powers solely on the basis of the amount of power which is available for 365 days in the year, of twenty-four hours for each day. Perhaps they are wise in so estimating, as the mistakes they may make in underestimating the usefulness of the water power are very often counterbalanced by the mistakes they are also making in the cost of its development and the possibilities of the market. But, however advisable it may be for a consulting engineer to neglect altogether the variable power a river is capable of furnishing, it is necessary in this discussion to consider the limits of variability which one should allow for development of a water power.

New England mills are equipped with both steam and water power, and there is probably no body of men in the country more familiar with variable water power than this. Water powers not continuous require an equivalent steam power equipment of engines, boilers and men, with full interest charges, and, in consequence, such powers only affect a saving equivalent to the fuel consumption of the steam engine. This, with continuous power and coal at the average New England price, amounts to approximately $36 per year, and, in consequence, it is not reasonable to contemplate the development of excess power beyond the continuous flow of the stream where the generation of the excess power involves capital and operation charges in excess of $36 per year. Furthermore, I do not consider that it is safe to estimate that this means that one should expend as much as $600 per horse power for the development of excess power. An organization which can only net 6% on the investment which it has made for machinery and equipment had better use its money in a banking business and go out of manufacturing. In fact, it is my opinion that it is unwise to develop the variable power of a river where the expenditure for this portion of the developing exceeds, on the basis of twelve months' supply of power, $200 per horse power, or, in other words, $100 per horse power for six months power, or about $150 per horse power for nine months power. I am confidently of the opinion that it is economical to develop the variable power, where the continuous power does not exceed in cost $300 per horse power and the variable power does not exceed $200 per horse power, based on a continuous rate.

A statement has been made, and I believe that such a statement is hard to disprove, that the development for continuous power at a cost not exceeding $300 per horse power produces energy at a rate with which steam plants can not compete successfully, no matter what the cost of fuel, and I am further of the opinion that where the excess power for a development does not cost more than $200 per horse power, it more than pays for the saving in fuel alone, and that this condition warrants the development of this excess power and the installation of a steam plant to be operated only during the time of the deficiency of water. As these opinions may not be easily justified in the installation of the plants having less than 1000 H. P. minimum capacity, and as the majority of mills and water powers to which the argument might apply are of less capacity than this, it may, at first sight, seem that the arguments which have been presented have no particular or general interest; but before you hastily arrive at this conclusion, I beg to call your attention to the fact that I have already stated and hold that as the business of a banker is not, in my opinion, legitimate business for a cotton mill, I hold, reasoning along the same lines, that the development, generation and distribution of power is no more the business of a cotton mill than making investments of a banking character would be.

The most notable example that has come to my attention of the wastefulness of low-head development is to be found at Holyoke, where the canals consume space which should be available for good factory sites and where they are losing from 20% to 25% of the entire power developed by reason of the inefficiency of many low-head wheels in series. I claim that it would not be correct to object that in such a case as that of Holyoke the inefficiency of electrical machinery and transmission would more than counterbalance the increased efficiency of the water wheels, since we all know that the introduction of the electrical drive will of itself overcome the loss from belting amounting to more than the inefficiency of the electrical machinery, and whatever increased efficiency there could be gained by the high head would be clear gain and increased power.

I do not intend in any of these instances to question the judgment of the builders of the mills or the developers of the water powers. The last generation certainly presented evidences of having at least as good a quality of brains as we have to-day; but I claim that simply because our forefathers worked out their problems as they did, makes no reason for our slavishly following their footsteps when the work that they and we have done in other lines produces new conditions which make it necessary in the future to meet their disadvantages. The changes the past twenty years have made in the design of water wheels and improvement of electrical machinery and steam

*Abstract of paper by F. A. C. Perrine, read before New England Manufacturers' Association.

engines renders to-day available the use of high water heads and long-distance transmission and auxiliary steam plants, not only without a necessary decrease of efficiency, but actually with an increase of efficiency and an improvement in the quality of the product.

The present day marks an era of consolidation and specialization, and all that has been said is in direct line with this tendency and is hardly more than calling attention to the fact of the improvements in hydraulics and hydraulic machinery, electrical generation, transmission and application, and the great change now made possible in the methods of power application over anything that has been seen heretofore in New England.

The advantage of these principles has been widely appreciated in the regions of the Rocky mountains and beyond, and by their application the manufacturers in these regious have succeeded in overcoming their very great disadvantage of inaccessibility and expensive fuel, even where they have had to run flumes and ditches from 5 to 50 miles in length and have had to transmit power to such great distances that the limit I have set of 35 miles seems to the Western engineers so short that they do not hesitate at rendering available powers that are at least 100 miles from a possible market.

Resurvey of Cripple Creek District.

Few field operations of the United States Geological Survey have created more local interest than the resurvey of the Cripple Creek, Colo., district. The original survey was made in 1893 and 1894 by Messrs. Whitman Cross and R. A. F. Penrose, assisted by E. B. Matthews. At that time comparatively few mines were in operation and none of them had gone deeper than 400 or 500 feet. Since then the number of mines has greatly increased and there has been remarkably extensive underground development throughout the district. Several shafts are now down over 1000 feet. These new conditions have made a resurvey of the district eminently desirable, if not absolutely essential to the economic development of the properties. So desirous were the chief mine owners of the district that the work should be done, and promptly, that the sum of $3500, equal to half the allotment necessary for the work, was raised among them by private subscription. This was turned over to the State Geologist, J. W. Finch, and work was begun by Waldemar Lindgren and F. L. Ransome of the United States Geological Survey. They are assisted in the field work by L. C. Graton and A. M. Rock. The field work is now about three-quarters done.

The district surveyed is about 5½ miles by 7 miles in extent. It is a district of concentrated values, all the prominent mines lying within a radius of 2 miles. Among the most importaut and best known properties are the Portland, Stratton's Independence, Vindicator, Golden Cycle, Isabella, Elkton, Mary McKinney and El Paso mines, and those owned by the Woods Investmeut Co. and the Stratton estate.

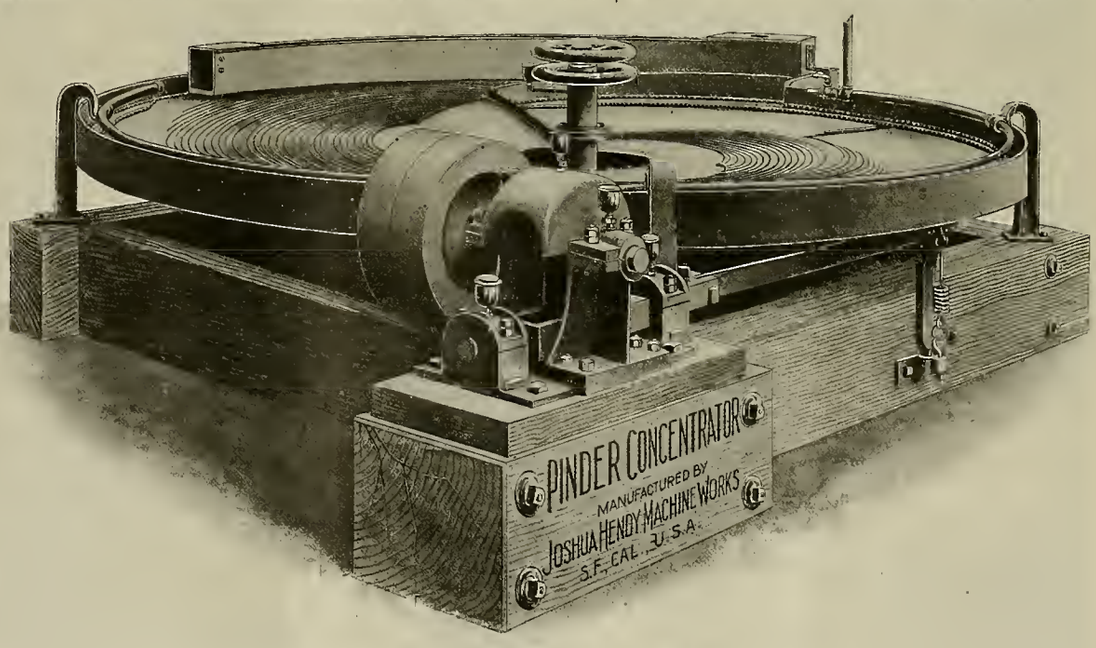
The geology of the district was well worked out in the survey of 1893 aud 1894, and in its main features will not be changed by the present investigation. Much new detail, however, will be added and considerable light will probably be thrown upon the nature and occurrence of the ores. The district, as was made known by Cross and Penrose, is located in and around the throat of an old volcano. The ore bodies are encountered in the volcanic breccia or in the granite enclosing it.

An interesting problem necessarily untouched by the original survey is the question of deep drainage. It is important to determine the source of the water that embarrasses operations in the lower levels of the mines, and to ascertain the manner in which it is stored in the rocks and the conditions that govern its movement when tapped by tunnels, with a view to suggesting the best scheme of general drainage for the district. It is expected that the El Paso, Mary McKinney and Elkton mines will be greatly benefited by the new El Paso drainage tunnel, but as this drains the El Paso mine only to the 600-foot level, it is clearly not a final solution of the drainage problem, even for this part of the district.

IN concentration sizing by screeus of variable mesh effects a separation of particles according to their relative size. In hydraulic classifiers, and on the various shaking table and belt concentrators, the separation is due to difference in specific gravity. A combination of the two methods abcomplishes the most complete and satisfactory results. A plant can usually be arranged to accomplish this automatically, but where this is not possible bucket elevators may be utilized for the same purpose.

The Pinder Concentrator.

The Pinder concentrator is essentially a pan, or batea, in the form of an involute, the surface being covered with brown linoleum, on which are fastened brass or copper riffles radiating spirally from the direction of the center outwardly and around toward the rim. The pan is 8 feet 9 inches across at the narrowest part. There is a spiral gradient of 1 inch in the surface of the pan, which extends all around, beginning at the widest part under the feed box. The floor also inclines to the center, forming a concave surface.



This pan is coustructed, say the manufacturers, so as to render it flexible, the bottom being made of seasoned redwood staves ¾ inch thick, and laid radially from the center (flexibility being obtained by allowing ⅛ inch interval between staves). The inner or narrow end of each stave is bolted to the center casting, and the outer end to a steel rim or band, ¼ inch by 5 inches.

The riffles tacked on to the linoleum are fifty-six in number and ¾ inch apart, the feather ends terminating in regular sequence nearly in a circle, so as to leave a clear smooth space between the ends and the rim of the pan. The wash or clear water is conducted by a pipe ¾ inch iu diameter around the outer edge of the pan. There are two discharge slots for concentrates, one at the end of the forty-second riffle and the other at the end of the entire system of riffles.

A steel post, 2¼ inches in diameter, acts as pivot as well as center support of the pan, passing through a sleeve in the center casting. Screwed to the top end of this post is the adjusting gear, by which the center of the pan is raised or lowered, changing the degree of incline of the surface of the pan. The tailings discharge is through the center of the pan. The distance of travel from feed to discharge is 27 feet. The machine should be run at 240 strokes per minute. The accompanying cuts show the main features of this machine, which is manufactured by the Joshua Hendy Machine Works, San Francisco, Cal.

Top View of the Pinder Concentrator.

The Pinder Concentrator Mounted on Base.

Use of the Mine Model.

TO THE EDITOR:—I note in your issue of October 17 au article entitled "New Use for a Mine Model." I quite agree with you that these models are of great use in mining, as I have been using them here the past year. Our model is made of plaster of Paris and has answered our purpose admirably. The scale is 100 feet to 3 inches on model. The model is made in horizontal sections, 1½ inch in thickness, to represent 100-foot levels, and between levels to show stopes; at levels the sections lift up on the floor line, the drifts and crosscuts being carved on the bottom of the section and raises and winzes in their proper

places. When the sections are assembled they show the hills in which the mine is situated in miniature and perfect in contour.

EDWIN H. DAVISON,
Mine Superintendent.

San Fernando, Mexico, Nov. 12.

Relative Value of Fuels.

Written for the MINING AND SCIENTIFIC PRESS by WM. H. KRITZER.

As in many mining districts managers have the choice of using either wood, coal or oil as fuel, a comparison as to their relative value is of interest. No fine distinctions between good wood and bad wood, coal of superior or inferior quality, or the several fuel oils, is made, but it is assumed that a good grade of either kind of fuel is employed, and that the arrangements as to grates, size of heating surface, disposition of dampers, etc., are suitable, and that as good results are obtained from each variety of fuel as ordinarily result from their use when in competent hands. With these conditions understood, and placing oil at $1 per barrel, the following tables are of interest:

TABLE SHOWING THE RELATIVE VALUE OF FUEL PRODUCTS.

Value of oil being $1.00 per barrel, equivalent to one ton of coal, ranging from $12 to $4 per ton.

Value of coal per ton	Pounds of steam generated by 1 pound of coal	Pounds of steam that 1 ton (2240 pounds) of coal generates	Barrels of oil required to generate the same number of pounds of steam produced by 1 ton of coal	Oil $1 per Barrel. Value of oil equivalent to 1 ton of coal	Oil $1 per Barrel. Money saving
$12.00	12.50	28,000	4.92	$4.92	$7.08
11.50	11.90	26,833	4.71	4.71	6.79
11.00	11.45	25,667	4.51	4.51	6.49
10.50	10.94	24,500	4.30	4.30	6.20
10.00	10.42	23,333	4.10	4.10	5.90
9.50	9.90	22,167	3.89	3.89	5.61
9.00	9.38	21,000	3.69	3.69	5.31
8.50	8.85	19,839	3.48	3.48	5.02
8.00	8.33	18,667	3.28	3.28	4.72

Pine	2,000	891	1.31	7,422

Kunzite—A New Gem.

The lilac-colored spodumene crystals lately discovered near Pala mission, in San Diego county, Cal., is described by the gem expert, George F. Kunz, after whom the mineral is named, as follows:

"A recent remarkable discovery of unaltered lilac-colored spodumene has lately been made in California. The crystals were obtained 50 feet from a deposit of colored tourmaline—itself of notable interest—1½ mile northeast from Pala, San Diego county. This new discovery is less than a mile northeast from the celebrated rubellite and lepidolite locality at that place, where recent developments have brought to light immense quantities of amblygonite, the latter species occurring by the ton, while the lepidolite is estimated by the thousand tons. The locality is thus unequaled in the world for its abundance of lithia minerals. The rubellite crystals found here are entirely embedded in lepidolite, and until recently it was found impossible to remove them to show their form. They were, however, often polished with the lepidolite, the rubellite appearing as radiations of pink in a darker gangue of a lilac-colored lepidolite. This year, however, the crystals of rubellite have been rubbed out, as it were—that is, made to stand out by removing the lepidolite matrix by means of brushes and cleaning tools, thus forming a beautiful group of crystals.

"At the new locality colored tourmaline crystals have been found that are remarkable in size and beauty, although they have been much broken in taking them out. Some are 1 foot long and 3 inches in diameter, with a red crystal core (rubellite) and a blue exterior (indicolite), separated by a pale intervening zone.

"The spodumene crystals are beautiful in their color tones, varying in striking contrast from a deep pink-purple lilac, when taken at a depth, to a pale, almost colorless, tinge, evidently due to weathering or to the action of the sunlight.

"These spodumene crystals are of extraordinary size, transparency and beauty, and are unrivaled by those from any other known localities. The following are the weights and dimensions of six of the principal crystals:

	Weight, Grams.	Weight, Ozs. Troy.	Dimensions—Centimeters.
No. 1	528 7	17 1	17 by 11 by 1
No. 2	528 7	17 1	22 by 8 by 1.5
No. 3	297	9 55	19 by 5.5 by 1 5
No. 4	256 0	8.25	23 by 4 by 2
No. 5	310.5	10.95	13 by 6 by 2.53
No. 6	239.5	7.70	18 by 4 by 2

"Some crystals of spodumene purporting to come from Hermosillo, Mexico, were shown to the writer. They are identical in habit, but much smaller than those from Pala. It is quite possible that they may have come from the same locality, and that no such occurrence exists at Hermosillo. There is no doubt, however, that the crystals from Pala belong to the locality ascribed to them. In either case no such spodumene crystals have ever before been found at any known locality. They are entirely distinct from the green crystals found at Stony Point, Alexander county, North Carolina, described by J. Lawrence Smith, and from the transparent yellow crystals found in Brazil and described by Pisani."

Large amounts of lepidolite (a lithia mica) have been mined at Pala for the lithia minerals contained, and in quarrying this the slender pink tourmalines (rubellite) have also been obtained, they occurring in groups of radiating crystals of rich pink color in the violet-colored, silvery lepidolite, forming cabinet specimens of great beauty. Gem tourmalines also occur near Hemet valley, in the San Jacinto mountains, in Riverside county, and at Mesa Grande, in San Diego county, California.

Universal Shaper.

The Universal Shaper, illustrated herewith, is stated by the manufacturers, the Cochrane–Bly Machine Works, Rochester, N. Y., to be adapted to intricate punch and die work, metal pattern and jig, making work possible thereby to be planed at any angle. It will be noted that the head of the column which supports the arm carrying the working head is graduated and may be clamped in any position about the column. The arm has an out and in adjustment allowing the working head to be brought to any position over the table. The working head may be adjusted to any angle about its axis which is at right angles to the arm, and the arm may also be adjusted to any angle about its axis, thus giving every possible angle. The ram is driven by a worm and wheel direct connected to a motor at the end of the arm. The stroke of the ram is adjustable. The clapper block may be adjusted to any position about the end of the ram; tools may be clamped either on the end or side.

Universal Shaper,

The Electric Furnace in Metallurgy.*

Written by ALBERT HELLER.

The temperature of the electric furnace is easily controlled during fining by the adjustment of the electrodes by hand. It can be increased to a point far above the temperature of the open hearth furnace, converter, or crucible furnace, and it is even possible to obtain a heat sufficient to volatilize the iron. By the process of electric fining, reactions can therefore be produced which are impossible in the open hearth. The process is carried on in the same manner as in the open hearth, that is, the same oxidizing agents are used, but the salient advantages are due to the mode of heating, which is neutral, and to the generation of heat above and on the surface of the molten metal. These are two essential points which, from the metallurgical point of view, constitute the difference between the method of fining by electricity and that currently employed. For this reason the steel obtained by a rational electric process, combined with modern metallurgical practice, is possessed of properties comparable with those of crucible steel. The decarburization should be effected preferably with the aid of metallic oxides, in particular with oxide of iron. If a blast is employed a rapid waste of the electrodes ensues; further, the oxygen of the air blast, after burning the greater portion of the more oxidizing elements, of which carbon is the chief, then reacts upon the iron, forming particles of oxide of iron which, being disseminated throughout the mass, rapidly change its quality. On the other hand, the oxygen of the oxide of iron, being in stable combination, is only freed by the energetic reducing action of the carbon. The ore process, therefore, appears to be that which is best applicable to the electric open hearth.

The dephosphorization and desulphurization of the metal bath are also facilitated by the character of the source of heat. The elimination of sulphur can be effected without difficulty owing to the ease with which a reducing action is promoted. Otherwise the conduct of the operation of fining by the electric method presents no further points of sufficient interest to report. The formation and removal of the slag also present no particular features of interest. Slags differing in character are of course formed successively where desulphurization takes place.

The final additions are made, as in the ordinary process. The only point to be noticed in regard to these is the economy which can be effected in the case of rare metals by the prevention of loss due to their oxidation while making the additions.

For the application on a large scale of the process just described the furnaces should be placed in line, just abreast to each other. Two fining furnaces are preferably arranged in front of each smelting furnace, each of which will receive the metal alternately, while fining is being completed in the other. A more practical arrangement suggests itself in cases where a large amount of power is available. The charges of all the reducing furnaces could be run off into a single ladle on a bogie traveling along the front of the battery of furnaces. The metal thus collected could be fined direct by bringing the ladle beneath an arrangement of electrodes similar to that described, or it might be teemed into a fining furnace of a capacity sufficient to receive the whole. Two such furnaces would then serve the whole battery of smelting furnaces; for if the latter were tapped every three hours, there would be six hours available for fining, tapping and repairing the hearth and walls.

An electric metallurgical works laid out on this plan, having available a force of 10,000 H. P. on the shaft of the turbines, could produce sixty tons of steel per day, of which fifty tons would be yielded by the smelting furnaces working on 55% ore and ten tons by the smelting of scrap. As far as possible the power should be generated by alternating monophase dynamos subdivided into groups of 1000 H. P. each. Of these eight would supply current to the smelting furnaces, and the other two would be devoted solely to the operation of fining.

*Abstract Proceedings of Iron and Steel Institute.

WHEN agricultural land has been patented no one has the right to enter the tract for the purpose of prospecting, even though there may be sufficient evidence on adjoining land to warrant the belief that there is valuable mineral on the agricultural land. The idea that one may so enter an agricultural patent, and then settle damages on condemnation proceedings, is erroneous.

California Miners' Association.

Beginniug on the 16th inst. and continuing nntil the evening of the 18th, the twelfth annnal convention of the California Miners' Association was in session in San Francisco, Cal. The sessions were attended by a nnmber of delegates from the mining counties.

An address of welcome was made by Governor Pardee in behalf of the commonwealth, and Mayor Schmitz addressed the convention representing the city of San Francisco.

President C. M. Belshaw reviewed the work of the association in past years and suggested certain changes in its operation with a view to making its work more direct and efficient. Among other subjects touched npon Mr. Belshaw suggested that the association volnnteer to act as an arbitrator between employer and miner in the adjustment of labor difficulties.

A number of papers were read by members of the association, including one by Dr. C. T. Dean, secretary of the California Petroleum Miners' Association, in which he stated that in 1900 the consumption of California petrolenm was 4,000,000 barrels; in 1901 it was 8,000,000 barrels, in 1902 it had risen to 13,692,514 barrels, and he anticipated that in 1903 it wonld reach 23,000,000 barrels, aud predicted that 1904 would see it increased to 30,000,000 barrels.

Mark B. Kerr, superintendent of the Jnmper Syndicate at Stent, Tuolumne county, read a paper on conservation of water in the high Sierras for mining uses and subseqnent employment of the same water in the valleys for irrigation.

An address on preservation of forests was made by J. J. Murray of Trinity county, who said that under the existing methods the forests could not be preserved; that the debris was allowed to accumulate year after year, and when a fire did once start it was extinguished only when there was nothing more to burn. Prior to 1848 the Indians burned the debris annnally in a systematic manner, and nntil this was again done the forests would always be in danger from fires.

J. A. Filcher, one of the World's Fair Commissioners, addressed the convention, explaining the purpose of the commission, and urging every miner to assist in making the best possible display. The committee has adopted a novel method to secnre valnable specimens, for which they propose to pay cash, the intrinsic value being determined by specific gravity method or otherwise. When the exhibition is closed these specimens may be sold and the money thus invested recovered. This scheme, it is hoped, will result in securing a rich exhibit, and remove the objection which has heretofore existed on the part of miners to loan rich specimens which were never returned.

During Tuesday's sessions of the convention a number of papers of a practical and technical kind were read. Samuel Shortridge addressed the convention, urging upon the Association persistent and untiring effort to secure a department of mines in the Federal Government, which sentiment was heartily applanded.

Members of the California Debris Commission addressed the convention ou the present status of hydraulic mining in California.

"Compressed Air in Mining" was the snbject of an interesting paper by E. A. Rix.

S. B. Christy of the University of California spoke on "Cyaniding Anriferous Sulphides Direct," giving interesting and valuable data and the resnlt of experiment along this liue.

F. A. Leach, superintendent of the United States Mint in San Francisco, Cal., read a paper on "Modern Mint Methods," in which the varions processes through which bullion is received from the miner passes npon reaching the Mint, to determine its value. Several practical suggestions were made to those depositing bullion, the most important being that they cast their bnllion into bars before bringing it to the Mint, thereby avoiding disappointment in losses.

E. C. Voorhies read a papcr on the "Use of Fuel Oil in Chlorination of Gold Ores," which showed the snperiority of crude petroleum over other kinds of fuel in this branch of metallnrgy.

"The Mother Lode in Amador County" was the title of a paper read by W. H. Storms, in which the structural features of the mines in that county were described.

C. H. Dunton of Placerville read a treatise on "Slate Making," in which he described the Eureka slate quarry in El Dorado county, Cal., and the methods of prodncing a commercial product there.

F. W. Griffin read a paper on "Gold Dredging in California and Elsewhere," dealing with a description of the various types of dredgers and their operation.

H. P. Stow of Forbestown, Butte county, read a paper descriptive of "An Improved Canvas Plant," in which he described his experience in concentratiug snlphides after vanners. It contained much detailed and valuable information on the subject.

On Wednesday, the third day of the convention, the sessions were enlivened by the renewal of the old fight between the miners ou one side, represented by its Association, and the farmers of a certain section of the Sacramento valley, represented by the Anti-Debris Association. It was to rehabilitate hydraulic mining, under certain restrictions prescribed by a board of United States Engineers, that the Miners' Association was first formed. This was accomplished by the passage of what is known as the Caminetti law. Under permits granted by the Debris Commission, hundreds of mines have beeu enabled to operate the past twelve years, despite the continued opposition of the Anti-Debris Association; but for several years past there has been no active opposition. At the convention the fight was renewed with energy and resulted in the passage of a nnmber of resolutions.

A paper was read by J. R. B. Tregloan on "Development of Abandoned Mines" on the Mother Lode. Other papers were read by title, to appear in the pnblished transactions of the association.

The report of the Committee on Resolutions was presented by E. C. Voorhies, as follows:

WHEREAS, Membership of a Californian upon the Rivers and Harbors Committee of tbe House of Representatives can be made of great service to the State of California; tberefore, be it

Resolved, That this convention urge the appointment of one of tbe members of the California delegation on tbe Rivers and Harbors Committee, and tbat our chairman and secretary be instructed to telegraph sucb indorsement to Speaker Cannon and earnestly request that he make such appointment.

WHEREAS, Tbe Committee on Department of Mines and Mining reports that it is of the opinion that it is impracticable at this time to obtain the consent of Congress to appoint a Cabinet officer for such a department, and that instead this Association should urge upon Congress tho necessity of at least creating a special commissioner of mines and mining under supervision of the Secretary of the Interior, of the Treasury, or of Commerce and Industries, as may be considered best; and

Whereas, Not only have the California Miners' Association, but also the Trans-Mississippi Congress, the National Mining Congress and kindred bodies for some years been urging upon Congress the necessity of creating a Department of Mines and Mining with a Cabinet officer at its head; and

Whereas, These efforts have thus far been apparently in vain, although a new Cabinet position has since been created in tbe Department of Commerce and Industries, having in charge many departments formerly under Cabinet officers, but omitting mining; and

Whereas, Different branches of the mining industry of tbe United States are now looked after by different bureaus, under different departments, with different heads; and

Whereas, It is the opinion of this Association that the best interests of the miner would be subserved by having an industry, which has grown in annual product from $369,319,300 in 1880 to $1,086,529,521 in 1901, reprosentod by a Commissioner of Mines and Mining under whatever department Congress may determine; and

Wbereas, It is perfectly woll understood that from 1867 to 1876 there was a Government Commissioner of Mines and Mining whose duty it was to collect statistics, historical and technical matter relating to mining, which office was abolisbed at the end of 1876; but it is recognized tbat at that time the general mining industry was of small importance as compared with the present conditions when its product is worth over $1,000,000,000 yearly; and

Wbereas, Upon the abolition of that office the United States Mint, United States Geological Survey and United States Census took consideration of these matters relating to mining, and have since continued, while the United States Land Office has been in charge of matters connected with tho mineral land locations, minerals, patents and titles.

Wbereas, The mineral industry is now in a position to demand from the Government the recognition due to its yearly increasing pecuniary and industrial importance, and to ask that its affairs be placed in charge of one Federal official to whom all miners may appeal, and who will collect statistics and matters relating to the technology of mining; therefore, be it

Resolved, Tbat tbe California Miners' Association, in convention assembled, ask that Congress appoint a separate and special Commissioner of Mines and Mining, whose work shall be done upon the lines of that of tbe Director of the United States Geological Survey, but to include undor his jurisdiction gold and silver, as well as all otber mineral substances produced in the United States, said commissioner to be under such cabinet officer as Congress may deem best; and

Resolved, That the president and secretary of this association be authorized and instructed to transmit copies of these resolutions and of the report of the committee on department of mines and mining, to the members of the California delegation in Congress, and respectfully ask their aid in the furtherance of the object desired, and request that a suitable bill be introduced to carry out such object in behalf, not only of the miners of California, but of those of tbe whole United States.

WHEREAS, The lapse of time frequently renders it difficult and sometimes impossible to prove with certainty tbe date of a mining location upon wbich a mineral patent has been based, thus giving rise at times to expensive and vexatious litigation, therefore be it

Resolved, That all patents for mineral lands hereafter granted or issued under or by autbority of the United States shall contain a statement of the date of the location of tbe claim or claims upon which tbe granting or issuance of such patent is based, and said statement shall be prima facie evidence of tbe date of such location in both State and Federal courts.

Resolved, That we urgently request our Representatives in Congress to secure appropriations for the purpose of building additional restraining dams and barriers for mining debris upon tbe tributaries of the Sacramento and the San Joaquin rivers, viz: Upon the Bear, American, Cosumnes, Mokelumne, Calaveras rivers and their branches.

Resolved, That the California Miners' Association looks with grave concern upon the differences that arise from time to time between the employer and employed in the mining industry in this State.

Resolved, That this association hereby offers its friendly aid in the settlement of any such differences that may bereafter arise. and to that end be it further

Resolved, Tbat whenever requested so to do by the several interested parties the president of tbis association shall appoint a committee to arbitrate such differences.

WHEREAS, Tbe Mining Bureau is tbe only organization in the State for the accumulation of data, records, maps and geological specimens for the general welfare of the mining industry; therefore be it

Resolved, That we earnestly request our Legislature to place the Mining Bureau upon a proper basis by making a sufficient and permanent appropriation for its support.

WHEREAS, The United States Debris Commission, having congressional authority to determine wbat hydraulic mines in the drainage basins of the Sacramento and San Joaquin rivers may legally conduct that form of mining, having in a written communication to this Association stated that there has been no considerable failure of any of the impounding barriers; but few cases of illegal mining discovered; tbe number of failures of dams comparatively small, and that no large percentage of debris has escaped by reason of failures of impounding works; and

Whereas, This Federal commission in charge of such work bas the best facilities for knowing of the practical workings of the law relating to hydraulic mining; therefore, be it

Resolved, That this Association deprecates the numerous and frequent attempts of the Anti-Debris Association, a private organization, without either Government or State sanction or authority, to interfere with individual mines and miners and obstruct, as far as it lies in its power, the workings of the law permitting hydraulic mining in the section referred to by serving injunctions and otherwise annoying miners who bave received legal licenses from the United States Government to mine by the hydraulic process.

Resolved, That we approve the recommendation of our president witb reference to "wildcat mining schemes," and the association will gladly furnish the public with any such information regarding such schemes that may be in its possession.

WHEREAS, The mining exbibit to be made at the Louisiana Purchase Exposition will to a certain extent advertise the mineral industry of California; therefore, be it

Resolved, That we earnestly request that the mining men throughout the State contribute specimens and samples, througb the State Mineralogist, to be oxhibited.

Resolved, That this association holds itself greatly indebted to tho public press of San Francisco and tbe mining counties for the assistance it has given not only to tbe association, but to tbe mining industry of California during the past year.

Resolved, That this association is under deep obligations to the merchants, manufacturers and business men of San Francisco for their generous financial aid during the past and previous years, and recognize the fact that without this special assistance it would have been unable to accomplisb one-half of what has been done. The association is free to acknowledge this, since the largest proportion of funds received has come from these gentlemen, who are only indirectly interested in the mining industry.

Resolved, Tbat we approve the project presented by El Dorado County Miners' Association for the construction of barriers and restraining works on Weaver creek, in El Dorado county, California, and we urgently request our representatives in Congress and in tbe State Legislature to secure appropriations for the purpose of building the same.

The following resolutions were passed looking to the extending of the business of hydraulic mining as already practiced under restrictions of the Debris Commission:

Resolved, That the California Miners' Association respectfully urges the Congress of the United States to appropriate the sum of $500,000, to be expended under the auspices of the California Debris Commission, for the purpose of constructing impounding dams or other restraining works on the several streams and their respective tributaries constituting the Sacramento and San Joaquin river systems, as outlined in the recommendations contained in executive document No. 267 (Fifty-first Congress, second session) and in executive document No. 98 (Forty-seventh Congress, first session), and that the Senators and Representatives in Congress from the State of California are hereby specially requested to use their best endeavors in securing the aforesaid appropriation.

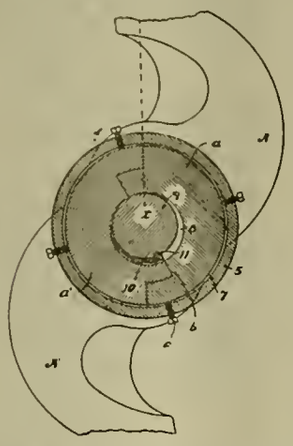
Resolved, That the California Miners' Association respectfully urges the Legislature of the State of California to appropriate the sum of $500,000 to be expended for the purpose of constructing impounding dams or other restraining works on the several streams and their respective tributaries constituting the Sacramento and San Joaquin river systems, as outlined in the recommendation contained in executive document No. 267 (Fifty-first Congress, second session) and in executive document No. 98 (Forty-seventh Congress, first session).

In recent years the officers of the Miners' Association has consisted of president, first, second and third vice-presidents, treasurer and secretary. At this convention the offices of second and third vice-presidents were abolished, and the executive committee, formerly with a large and scattered membership, was replaced by an advisory board of eleven members. The following officers were elected for the ensuing year:

President, C. M. Belshaw of Contra Costa, second term.

Vice-president, H. P. Stowe of Butte.

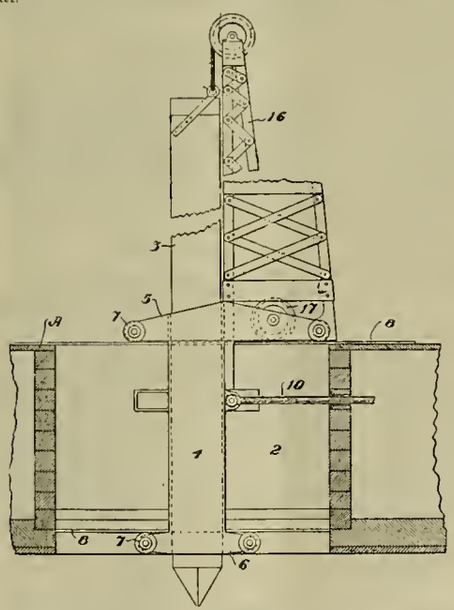
Treasurer, S. J. Hendy of San Francisco, fifth term.



Secretary, E. H. Benjamin of Alameda, sixth term.

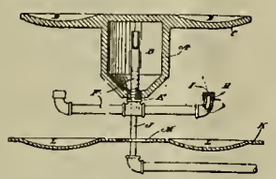
Mining and Metallurgical Patents.

PATENTS ISSUED NOVEMBER 10, 1903.



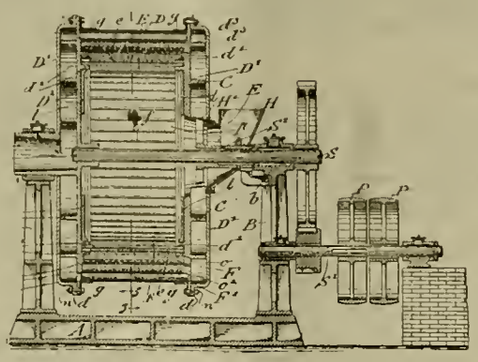
Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

Sectional Cam for Ore Stamps.—No. 743,681; A. P. J. Bossell, Angels Camp, Cal.



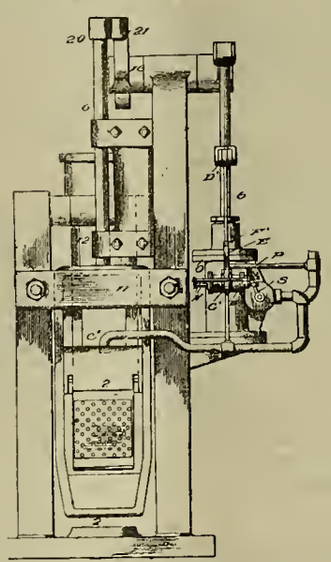
In cam, combination of two separate members having interlocking hub sections divided on lines within ends of cam, each of cam members formed integral with curved tang or segmental flange which overlaps line of division of hub and is adapted to bear upon opposite hub section, each hub section having a curved recess of which the segmental flange forms an outer wall, and projection on one section adapted to fit recess of opposing section, and sections having cam grooves in bearing surfaces, and segmental key slidable in grooves.

Dredger.—No. 743,751; R. A. Perry, Oakland, Cal.



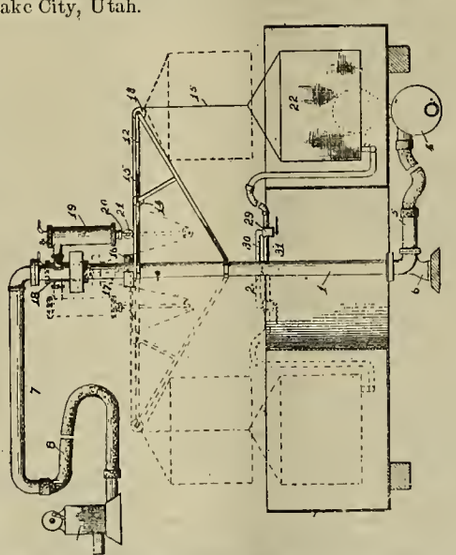
Dredge boat having open vertical longitudinally disposed channel, spud or pile adapted to be driven through channel into mud beneath boat, means by which boat is movable in direction of its length with relation to fixed pile, and device carried upon boat and movable with pile and operating substantially in line therewith, by which pile may be withdrawn from bottom.

Hydrocarbon Burner.—No. 743,976; L. E. Coleman, Santa Ana, Cal.



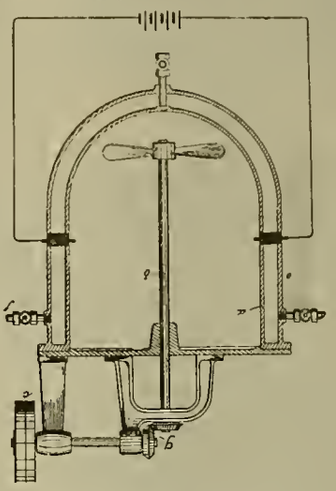
Hydrocarbon burner comprising removable vertical retort chamber; spreader plate affixed to casing of retort chamber at top thereof; vapor pipe commencing within chamber extending from near top of retort chamber out through bottom and extending thence and terminating centrally below spreader plate; burner tip on end of vapor pipe below spreader plate; fuel supply pipe opening into retort chamber; bed plate below vapor pipe having draft opening therethrough disposed to one side of burner tip.

Ball Grinding Mill.—No. 743,791; M. F. Abbe, New York, N. Y.



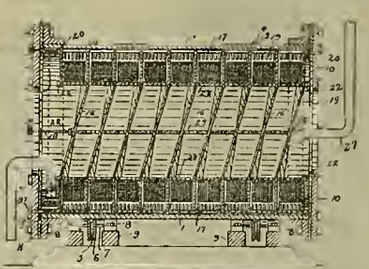
Ball grinding mill, comprising drum composed of cylinder having heads, and provided with heads exterior to and at some distance from cylinder heads, hopper in feed-end heads of cylinder, plurality of transverse steel bars arranged between heads of cylinder concentrical to cylinder, screens between bars and cylinder, openings in feed-end head of cylinder at inner side of screens, spiral conveyer between feed-end cylinder head and exterior head, openings in discharge-end head between outer heads.

Method of Crushing and Stamping Ores.—No. 743,799; J. C. Anderson, Highland Park, Ill.



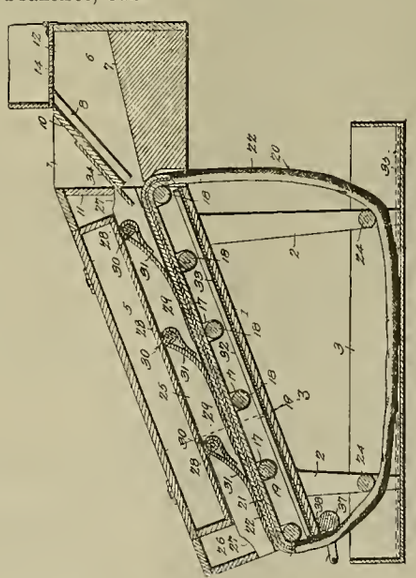
Method of milling ores by lifting die of stamp mill by direct application of suitable column or head of water delivered to point of application of power through pipe or similar closed conduit, and allowing water to escape and permitting die to descend by gravity, and conducting water exhausted into stamp mortar for pulping crushed ore.

Rotary Filter. — No. 743,652; G. Moore, Salt Lake City, Utah.



Filter comprising revolubly mounted standard, filtering means carried thereby, tank containing material to be filtered, arm projecting from standard, devices carried by arm for sustaining filtering medium and for lowering same into and removing same from receptacle, and mechanism for producing first drawing and then blowing action through filtering medium.

Extracting Chromium From Chrome-Iron Ore.—No. 743,668; R. Suchy and H. Specketer, Griesheim-on-the-Main, Germany.



Process of making soluble chrome-iron ore and obtaining chromium compounds by heating ore together with sulphuric acid in excess and an oxidizing agent and separating by filtration precipitated insoluble ferrisulphate from chrome-sulpho acid.

Amaloamator.—No. 743,871; H. Hoeschen, G. Marks and H. Eisele, Omaha, Neb.

Amalgamator comprising rotatable cylinder, internal spiral amalgamating and conveying plate carried by cylinder and rotatable therewith, mixing paddles and collecting blades adjustably held between convolutions of spiral plate, settling chamber formed at one end of cylinder, means for rotating cylinder, means for feeding pulp into cylinder, means for removing exhausted pulp from settling chamber, and means automatically controlling removal.

Ore Separator.—No. 743,413; J. W. E. Allen, San Francisco, Cal.

In ore separator, combination with endless apron, of supporting and clamping means comprising suitably supported recessed strips having rollers mounted therein, and detachable clamping strips disposed above same, edges of portion of apron being held between supporting strips and clamping strips.

Mining Summary.

SPECIALLY COMPILED AND REPORTED FOR THE MINING AND SCIENTIFIC PRESS.

The U. S. Census Bureau on the 13th inst. issued a preliminary report showing that during the calendar year 1902 there were mined in the United States 4211 short tons of emery and corundum, valued at $104,335; 335 tons of garnet, valued at $132,829; 12,439 tons of marl, valued at $12,741, and 6240 tons of infusorial earth, tripoli and pumice, valued at $54,558, exclusive of $1436 in value mined as a by-product of soapstone and talc.

ALASKA.

(Special Correspondence). — The tin-bearing ledges, which have been located as a result of finding stream tin associated with placer gold near Teller, on the Seward peninsula, have been bought by J. H. Hutchinson, of Boise, Idaho, for several years manager of the Trade Dollar mine of Idaho. He was on the ground soon after the discovery and helped to organize development work. He has taken to Boise half a ton of ore sacked for treatment and is preparing to return early in the spring and open the claims with a number of men.

The United States at present imports all the tin used in the country, which last year reached about 70,000,000 pounds, the price ranging near 30 cents per pound. It is understood from A. Collier, of the United States Geological Survey, who has been conducting surveys on Seward peninsula the past season, that the Bureau will issue a special hulletin on this discovery.

Boise, Idaho, Nov. 16.

Slate and Nizina, Copper river's two producing placer districts, yielded $500,000 in gold during the past season, says G. M. Esterly, operating in that section. The past season has demonstrated that Nizina is essentially a hydraulic district.

ARIZONA.

Cochise County.

D. Hart, G. Keenhold and J. Jacohsen are reported to have bought seven claims hetween the Bisbee West and Wolverine mines, near Bishee, for $40,000. The claims include the Southern Belle, Occident, Orient and Old Kentuck. Development will be increased.

Graham County.

A. F. Hoffmann & Co., operating in Garfield gulch, near Clifton, are preparing to build a stamp mill for their gold property. They have a 3-foot vein at the hottom of a 40-foot shaft sunk on the vein.

C. E. Stevens, superintendent of the Stevens mines at Metcalf, reports the steam plant in operation and sinking in the winze progressing. The gasoline plant proved unsatisfactory and steam was substituted. The company is pumping 30,000 gallons of water per day from its mine.

Maricopa County.

(Special Correspondence.) — The Lime Creek C. Co. has men at work in the Cave Creek district.——J. E. Maddox is working on his property in the White Tank mountains taking out ore which he is sending to the mill at Buckeye. The ore is free milling, and yields $30 per ton on the plates.

R. E. Miner is working his group near the Union mines north of Phœnix. Developments have shown an ore body.

A large hody of kaolin has been uncovered on one of C. O. Case's claims east of Wickenhurg. In that section it is not profitahle to ship kaolin on account of high freight rates, and there is no local demand for it.——Wolframite is reported found north of Phœnix.

Phœnix, November 16.

(Special Correspondence).—It is reported the Gold Coin mine, south of Phœnix, will resume work by Dec. 1. —— The discovery of a good grade of muscovite is reported hy a prospector in the Santa Estrella mountains, south and west of Phœnix.

J. D. Houck of Cave Creek says that miners and prospectors are coming in every day for supplies and report finding values hoth in old workings and new properties. —— J. Moore and H. Linville are reopening the Mexican mine in Cave Creek district. —— W. L. McKay is getting out copper ore from his claims near Cave Creek postoffice.

Phœnix, Nov. 16.

(Special Correspondence).—The Pike's Peak G. M. Co. has men at work on its group near Phœnix, says Manager Hewin. ——C. E. Rand has ohtained a controlling interest in a lead property near Wickenburg that will be worked for vanadium and molyhdenum values. —— The stamp mill at Buckeye is crushing high-grade ore from the Black Hawk mine in the White Tank mountains. —— A contract has been let for sinking the shaft on the Governor Brodie bismuth claim to depth of 250 feet. —— Donofrio & Eddy, doing development work on their claims near Frog Tanks, report cutting a ledge of high-grade ore 5 feet in width. They will put in machinery. —— The Angel mine, near Wickenhurg, has eleven men at work, and hy Dec. I thirty men will be employed.

Phœnix, Nov. 17.

Mohave County.

The hoisting plant of the Treasure Hill M. Co. at Treasure Hill, near Cerhat, is in place and sinking the shaft resumed. Delay was caused hy failure to receive timbers for the gallows-frame. When the shaft is down 200 feet crosscuts will he run. It is said six veins outcrop within the two locations.

Pinal County.

(Special Correspondence).—The miners at Superior have struck for higher wages and thirty men are out. The company will ohtain other men in Phœnix to take their places.——G. Emmet has men at work on the Gila Monster group of claims on Mineral creek above Kelvin.

The Troy-Manhattan Co., at Troy, will build a smelter near Riverside on the Gila river as soon as the track of the Phœnix & Eastern Railroad is laid to that point. The track gang is laying track hetween Queen creek and Florence. In ahout two months they expect to he at Riverside.

E. S. Russell and A. L. Arthur have a group adjoining the Superior C. Co. claims, near Florence, which they will work the coming winter.

Florence, November 16.

Santa Cruz County.

The International Cyanide Co., of which A. Hoover is president and manager, will develop its gold prospects 18 miles north of Nogales. It is said assays from the ledge 40 feet wide average $3.50 free gold per ton.

Yavapai County.

(Special Correspondence).—Tbe Grijalva Coarse Gold Co. is increasing development work on its group north of Wickenburg. This property was formerly worked by Mexicans. It is reported they will huild a mill.——J. V. Rohy and J. Rogers are getting out ore from their claims in Buckhorn district. The ore is packed to the smelter at Wickenhurg.

At the Boaz mine men are at work and more will he added. The mill will be put in shape for an extended run.——The Allen stamp mill, near Columhia, will he repaired.

Wickenhurg, Novemher 16.

It is reported H. B. Clifford has bonded the Contention mine in the Bradshaw mountasns, southeast of Prescott, and development work will he increased.

CALIFORNIA.

Fresno County.

The Esperanza Oil Co., at Coalinga, has put in an electric lighting plant to obviate the danger incurred from torches and lamps. The entiro lease will be lighted. Work is progressing on its No. 4 well.

The Oil City Petroleum Co., at Coalinga, has huilt another 1200-harrel storage tank, which gives this company a total storage capacity of 3500 harrels, to take its oil from seven producing wells. Its eighth well is in the oil sand.

Inyo County.

There are twenty men on the payroll of the Cecil R. M. Co., near Ballarat.——At the Ratcliffe mine, in Panamint section, men are at work and the mill is kept running, says the Randsburg Miner.

Superintendent Vahrenkamp is huilding a mill on the property formerly owned hy the Ballarat M. Co., near Ballarat.

At Camp Lyon, near Ballarat, the Golden Argus M. & M. Co. is increasing work on the crosscut to tap the main ledge.——At Tuha canyon, in Panamint mountains, J. P. Flint has men at work, and put his 12-stamp mill in operation this week.

Kern County.

The Sanborn Oil Co., operating in the Devil's Den district, northwest of McKittrick, has machinery on the ground and will drill several additional wells.

Nevada County.

(Special Correspondence).—At Meadow Lake the Cash on the Dump Co., which hought the Freeman and Vineyard mines, has hegun development work on its five claims. In the spring a mill and hoisting works will he huilt. This company is composed of Eastern and Los Angeles men. J. D. Hoff, of San Francisco, is manager and consulting engineer. The Crystal Lake G. M. Co., operating the Hartley property, the Excelsior and Union mines, adjoining the Cash on the Dump mines, has been operating the past year, and last week made a satisfactory cleanup. They have closed down the 10-stamp mill for the winter. During the winter development work will he continued to open up the ore hodies so the mill may he run full time, instead of hut fifteen hours for several months past. The shaft is down 90 feet and showing ore, but will not he worked in, as it is not protected for winter work. Hoisting has been done hy a horse whim, hut water power will he installed next spring. The crosscut from the south tunnel will he driven 60 fect and a drift run on the ledge. This drift will run under middle and north cut at 90 feet helow surface.

The Crystal Lake G. M. Co. has a plant of ten stamps, with one table and two helt concentrators, one 8x10 rock breaker, air compressor and three machine drills—all driven hy water supplied from Meadow lake, through a 14-inch pipe 4800 feet long, delivering under a head of 250 feet. The California Ore Reduction Co. has put up a roaster plant, operated hy water power and using crude oil for fuel. This company has a storage tank at Truckee holding 300 harrels of oil. The oil is hauled in 1000-gallon tank wagons to Meadow Lake—36 miles. The cost of the oil delivered in company's tank at the mine is about ten cents per gallon. Owing to lateness of season and soft roads, no oil has been hauled and the plant will not be operated till spring. It has capacity of seven tons of concentrates per day, and including all expenses is expected to roast at cost of $2.43 per ton. The Excelsior ores run 6% in sulphurets. The ten stamps crush from 35 to 38 tons per day. At Old Man mountain, 3 miles southwest of Meadow Lake, the claims of tbe Girard M. Co. and L. Butts have been bonded, and development work will he done this winter.

Emigrant Gap, Nov. 17.

W. J. Organ of Nevada City, superintendent of the Tilton group of mines on the South Yuba river, near Edwards' crossing, says he will put the mill in repair preparatory to resuming.

The Champion M. Co. at Nevada City is removing the pumps from the Spanish mine.

J. McCaffrey, superintendent of the Polar Star mine, near Nevada City, says he has pulled the pumps out of the mine on orders from the Eastern office. No reasons were given. It is thought the suspension of operations will only he temporary. The track and other equipments in the mine will he allowed to stand.

The work of lowering the water at the Brunswick mine, near Grass Valley, is progressing, says Superintendent Nealon. The water is helow the 1000-foot station. Men are at work putting in the second of the electric pumps. A station has been cut for it at that level.

The Gold Bank mine, near Washington, will not start up until next spring, says T. A. Kohler, half owner.

Placer County.

(Special Correspondence).—The Trinidad mine in Sailor canyon, near the American river, near Emigrant Gap, has taken in winter supplies and will operate ten stamps. The ore is of fair grade hut the conditions are such that mining and milling is heing done at a cost of 88 cents per ton. Ore is mined hy a system similar to that employed some years ago in the Old Spanish mine in Nevada county, wbere ore was stoped, shot down a raise, and delivered to mill by gravity for 67 cents per ton. This property is owned by G. S. Montgomery of Beulah. A. J. Frœhlich is superintendent.

Emigrant Gap, Nov. 17.

San Diego County.

M. Jacques and F. S. Newcomh, operating a group of claims at Banner, including the Eureka, Florence, Lone Jack and Gold Standard, are building a reservoir for water to run a mill. The Gold Standard is an extension of the Golden Chariot and a crosscut tunnel has been driven 360 feet to strike the Golden Chariot contact, says the Julian Miner. There is a spring on the Florence, where the reservoir is heing huilt, which will afford water to run a 20-stamp mill, the fall being 60 feet.

Sierra County.

The stamp mill at the Telegraph mine began operations last week and five stamps are steadily dropping. The other five stamps will he dropping this week. The Telegraph mine is at Fir Cap, 9 miles from Downieville. It is owned by Eastern men and is superintended hy J. W. Finney. The Telegraph was originally a gravel mine, and, while working as such, the ledge was struck.

Siskiyou County.

The Yreka Journal says the snowfall of the past week on the high mountains gives promise of starting a good water supply for the placer miners along the creeks and within reach of ditches. Should there he more storms soon, there may be water enough for hydraulicking also and for ground sluicing.

The Blue Gravel mine has been bought by E. Wallace and his company will work it in conjunction with the race track property at Yreka.

The McCook mill on Humhug creek, north of Yreka, will hegin work this week crushing ore from the Punch Creek mine (the Mono), owned by G. W. Grayson. Development work has heen in progress under presont management for a year. There are 600 tons of ore on the dump that will he milled. Grayson intends to huild a 10-stamp mill. In the face of the tunnel the ledge has width of 11 feet.

Tuolumne County.

At the Blue Bell and Rosella mines, near Carters, under bond to R. Cunningham of Bakersfield, the shaft is down 75 feet, showing a hody of quartz. A steam hoist will he put in.

At the Hampton mine at Tuttletown a tramway 250 feet long has been completed from the mine to the Darrow mill. There are forty tons of ore in the hins ready for crushing as soon as water power can he ohtained. —— The Toledo mine closed down last week.——The Street M. Co. has heen incorporated, with principal place of business in San Francisco, hy J. A. Stroud, R. Kinsman, J. Hartery, L. J. Shumau and W. C. Beatie, to operate the Street mine near Tuttletown.

At the Santa Ysabel mine, near Stent, after a shut down of two years, operations were resumed under the management of E. C. Loftus, and twenty-five men are at work, says the Magnet. An auxiliary steam plant has heen put in and the company can continue operations when water power is not obtainahle. Three shifts are sinking the three-compartment shaft from depth of 200 feet, and other development has heen started.

At the Jumper mine at Stent, Manager Kerr has men grading for an additional twenty stamps. When in place the mill will havo eighty stamps.

Ventura County.

After a shut down of several months, the Sulphur Mountain Oil Co. has resumed operations at Sulphur mountain, north of Ventura. They have begun drilling on No. 2.

COLORADO.

Denver advices say the reported negotiations hetween the operators and the striking miners in the northern Colorado coal district failed, and the men are still out. Because of the lack of coal, owing to the miners' strike, tbe Rocky Mountain Paper Co. at Denver has closed its mills for an indefinite period, throwing out 200 persons.

Boulder County.

The United States G. Corporation bas put in an air compressor plant at the portal of the tunnel, which will be driven ahead. The group of this company in Fourth of July gulch, at the hase of the Contiuental divide, 7 miles above Eldora, is accessihle hy a good wagon road and near the Denver, Northwestern Pacific railroad, heing huilt. The holdings consist of 230 acres of mineral ground containing eleven lode claims and 180 acres of placer ground, the latter heing covered with timher. The plan of development to open up the ore hodies is to drive a crosscut tunnel 1500 feet into Arapahoe mountain. This tunnel will cut the lowest vein at depth of 200 feet and the highest vein at depth of 1000 feet.

Chaffee County.

At the Vivandiere mill, near Salida, the foundations for the buildings are completed and the machinery and framework are on the ground. Another carload of machinery, consisting of a roaster, tables, jigs, etc., arrived last week, says Manager New. The site of the mill is near the Gold Bug mine, half a mile helow the Vivandiere. The object is to accommodate the Gold Bug ore and have the mill easily accessihle from all parts of the district. The capacity will he fifty tons per day to start with.

Clear Creek County.

The Mendota mill, near Silver Plume, is running full time again, and sixty tons of dump material is being handled daily. ——Cavanaugh & Allen have a lease on a block of Vulcan ground and are driving the drift and also stoping on an ore shoot.

Work has been resumed on the West End tunnel at Dumont, which is being driven hy the owners of the Kaverue miue to cut their vein 200 feet helow the prosent workings. The tunnel will be 1600 feet in length, about half the distance having heen already driven hy hand. It is intended to put in an air compressor plant. The mine is equipped with a 10-stamp mill operated hy water power.

M. Riley, of Georgetown, has a hond

and lease on the Edgar, Providence and Chance, also a lease on the Fred Rogers and Government lodes on Democrat mountain, near Georgetown. It is intended to clean up the Rogers for distance of 100 feet and work will be started in sinking the shaft on the Government. Work will be resumed on the Rogers and Edgar, and the shaft sunk at intersection of vein, at which point 4 feet of quartz has been opened, which has given returns averaging 373 ounces in silver to the ton.

A strike was made last week in the Helen-Harold tunnel on Wood mountain, near Georgetown. An 18-inch shoot of quartz gave assays of $65. The tunnel on the Helen-Harold is in 850 feet and has reached depth of 550 feet. They will continue the bore for another 200 feet. A mill will be built ready for operation this spring. The property of the Helen-Harold M. Co. consists of seven claims. Machine drills and a compressor will be put in.

Manager C. S. Desch of the Corry M. Co., near Silver Plume, says arrangements have been made for building a concentrating mill for treating their ore on the ground instead of shipping. Their ores run $7 per ton.

The Santiago group in East Argentine district, near Georgetown, was sold last week to the Hazelton G. M. & M. Co. for $250,000. A cyaniding and concentrating plant will be built in the spring. The Hazelton Co. also owns the Baltimore group. W. Rodgers is manager.

Dolores County.

L. Habermann, lessee of the Wellington group of mines on C. H. C. hill, near Rico, reports opening up a body of high-grade carbonate and is preparing for shipments during the winter. He will put more men to work. —— The Ocean Wave M. Co. continues operations in Horse gulch. The Rico vein is being opened up by the main tunnel.

Fremont County.

Florence reports say by Dec. 1st there will be thirteen strings of tools working in the Florence oil field. Some of these wells are expected to strike oil before that date. Among the new companies operating is the West Lebanon of Indiana. Victor Oil, Gas & Coke Co. of Florence and Victor will drill two wells, the Columbia Crude Oil Co. of Denver and Cripple Creek will drill four, and Lloyd & Co. of Colorado Springs will drill one well.

The Dorcas reduction works, near Florence, will be enlarged. Five leaching tanks will be added, two of which are to be installed without delay. The tanks are to be 30 feet in diameter. It is said the company proposes enlarging the plant from time to time till it will have a monthly capacity of 10,000 tons.

Gilpin County.

The Pittsburg Con. G. M. & M. Co. is again operating the Gold Dirt mine, at Rollinsville, says Superintendent Anderson.

Aurora, Ill., parties are preparing for further development of the property of the Orado G. M. Co. in Eureka district, near Central City. A. Skeels is superintendent. The milling ores run three ounces gold to the cord. The group is west of the Concrete, Gunnell and Grand Army mines.

The Granville G. M. & M. Co. has been incorporated to operate near Central City by B. G. Granville, J. L., W. H. & P. R. Hoefler and W. M. Keenan.

It is reported work will be resumed on the Newfoundland mine on Gunnell hill, near Central City.

A power plant will be built for the Specie Payment tunnel. A large compressor and engine will be put in. A tunnel has been started in Virginia canyon to cut 700 feet below the deepest workings of the Specie Payment. The distance to the shaft is 3000 feet.

The Fairfield mine shaft, near Russell Gulch, is down 576 feet and sinking has been stopped. It is operated under lease and bond by the Fairfield G. M. Co., in which Baltimore, Md., parties are interested. In sinking the last lift of 100 feet the shaft showed a vein with 6 inches of a smelting streak which carried values of $200 per ton. Shipments will be increased. J. C. Williams is superintendent and W. J. Nickerson is manager.

Gunnison County.

The Netted Gem G. M. Co. has been incorporated by R. S. Beymer, M. Denson and R. S. Beall of Rocky Ford and A. and B. Beymer of Bowerman. The company owns the Netted Gem group, west of Bowerman, and will start development. —— The Bessemer M. Co. of Pueblo has been organized to operate in Bowerman district by G. G. Witzke and A. H. H. Baxter of Pueblo. The company owns the Leona group, which it is developing. A 4-foot vein has been opened in the shaft, which shows free gold.——The Piute group of eight claims and a half interest in the Fool's Errand group of seven claims, adjoining the Independent group, were sold last week to the Belzora-Bassick M. & Dev. Co. of Michigan. The company will continue development this winter.

A 5-foot vein of free-milling gold ore assaying $8 per ton has been struck in a crosscut being run from the lower tunnel of the Woods G. M. Co.'s property, consisting of sixteen claims in Pie Plant gulch, near Tin Cup. Also, in the upper tunnel they have 15 feet of free-milling ore. Their 100-ton amalgamating and concentrating mill has been completed and will be started up in the spring.

Hinsdale County.

Superintendent H. Harrington of the Ohio group, near Lake City, says he is putting in a hoisting plant.

E. F. Calvin has a lease on the W. C. Garlock group in Silver Coin gulch, near Lake City.

It is reported the Henson Creek Lead M. Co., near Lake City, will resume operations.

Lake County.

The Yak Tunnel Co., at Leadville, is shipping 3000 tons of ore a month and at the same time increasing development work in all parts of their territory. The connections at the Ibex properties at the tunnel have all been completed, and while the tunnel now extends only to the Ibex No. 4 shaft, it is expected it will later be driven farther into Breece hill.

The Fryer Hill M. Co. at Leadville is operating twelve separate properties, and the output from them all is handled from the El Paso shaft, says the Times. The output is principally sulphide, of which 150 tons daily are shipped to the Murray plant of the A. S. & R. Co. near Salt Lake City, Utah. The siliceous ores from the Jimmie Lee, Cora Belle and Bangkok are being sent to the local plant. The water in the properties has been lowered and only 400 gallons per minute is being raised.

The Arkansas Valley smelter, near Leadville, is running full force and its eight furnaces are handling 1000 tons a day, and this work gives employment to 800 men. The sulphide mill with its sampling equipment is also operating, treating 300 tons a day.

The pumping machinery at the Pride of the West shaft of the Fryer Hill M. Co., at Leadville, is handling fifty gallons of water per minute while the shaft is being sunk. The shaft is down 380 feet. At the ore horizon they will drift for the Progressive shoot. —— Repairs have been made at the Vega shaft house, on the north side of Big Evans gulch, near the Diamond. The shaft will be sunk.

La Plata County.

(Special Correspondonce).—A strike of high-grade ore has been made on the May Day mine, at the entrance to La Plata canyon, and the mine sold to Denver and Durango men for $50,000, one-tenth down and the remainder in two and four months. Sinking will be done. At depth of 35 feet the vein has widened to 2 feet, and the smolter returns are said to give value of $150 per ton on unsorted ore. ——Work on the Southern Boy mine has been stopped, all the men having been put to work on development of the May Day mine.

The Bonnie Girl M. Co. is increasing work on its properties at La Plata, having forty men a mile up stream from the town putting up buildings, making roads, and ditching for a pipe line. A boarding house for 200 men is nearing completion and a large hunk-house commenced. By December 1st they will start building the mill, the first unit of which will be fifty stamps. It will be connected with the mine by a wire-rope tramway, half a mile in length. The ore body is in lime and porphyry—a network of blankets, dikes and fissures. The average value of the rock is $5 per ton.

The Cumberland mine, at the head of the La Plata, is being reopened by Cripple Creek lessees, and it is reported a body of shipping ore has been struck.

La Plata, Nov. 16.

The May Day mine, near La Plata, has been sold to D. G. Miller of Creede, with A. E. Reynolds, C. E. McConnell et al. The men from the Southern Boy mine have been transferred to the May Day and more are being added. Superintendent Beach is grading for a shaft and ore house and other buildings. A whim will be used for hoisting until water is reached.

Las Animas County.

Trinidad reports of the 17th inst. say the exodus of coal miners to other sections since the strike was inaugurated is estimated to aggregate to date 1000 men (one-seventh of the entire working force of Las Animas and Huerfano counties). The cold weather is causing suffering among strikers' families, who are living in tents near the coal camps. All strikers at Hastings have been warned to vacate the company's houses at once.——Officials of the Colorado Fuel & Iron Co. at Pueblo say the coal miners' strike will be solved in their favor by aid from the steel and iron works men, who have been laid off at Pueblo, and who are going to the coal mines.——Two thousand of the workmen in several departments of the steel works have been laid off, as those departments were suspended on account of the cutting off of the coal supply by the strike. A carload of them went to the Walsen mine, near Walsenburg (Huerfano county), and began operation of the coal cutting machines on the 17th inst. General Manager Welborn of the Colorado F. & I. Co. says they have more miners working now than at any time since the strike began and each day adds to the output.

Montezuma County.

(Special Correspondence).—The mines and mill of the Mancos Con. M. Co., at head of East Mancos river, near Mancos, has been shut down on account of labor troubles and the freezing of the water supply. This property is controlled by J. Doyle, discoverer of the famous Portland mine at Victor. The ore body is 2 to 6 feet in thickness and the deepest workings are down 500 feet. A few men will be kept on development work during the winter, but the mill will not be started again before spring.

Mancos, Nov. 15.

Ouray County.

Work on the mill for the Bobtail mine, near Red mountain, is progressing. The mill is of 50-ton capacity and the machinery is being set up.

San Juan County.

Since cutting the Oscoola vein, in the Green Mountain group, near Silverton, the single drill will be supplanted by five machine drills. A cross-compound steam operated air compressor will be put in.

The Buckley mine, in Eureka district, has been bought by B. G. Granville of Central City, and operations have been started under superintendency of J. Loughran. Ore is being broken and shipped to the Eagle mill.

The Benson tunnel on Galena mountain, near Silverton, is in 1500 feet, attaining depth of 1200 feet. It is expected the German Oak vein, 26 feet wide and giving surface values of $10, will be reached within the next 300 feet. At 1100 feet a blind lead 9 feet wide was passed through, which gave returns of $15 per ton.

The Kendrick-Gelder Co. has completed the 5400-foot tram which connects the Henrietta mine with the terminal on the S. & G. Northerly Railroad, near Silverton. The tram will have capacity of 500 tons daily. The mine is under development with fifteen men and electric drills. The 150-ton capacity smelter is ready for operation.

The Highland Mary mill, near Silverton, is producing concentrates at the rate of one car a day, says the Standard. The ore goes four into one, with values mainly in copper and lead.

San Miguel County.

With the Carriboau-Montezuma mill near Ophir temporarily closed, the Silver Bell mill of fifty stamps is the only reduction plant in the county working at present, says the San Miguel Examiner. It is running full capacity and treating 200 tons of ore daily, which yields besides the values saved by amalgamation on the plates an average of two cars of concentrates per day. Manager Buckley is pushing development on the Ida. About 100 men are at work at the Ophir Con.

The electric motor and hoist for the Mayflower group, in Bridal Veil basin, near Telluride, are being set up.

The North Star group of claims on Silver mountain, north of Ophir, has been bought by the owners of the Carbonero group and development will be increased. G. B. Pickett, of Ophir, is manager. The Carbonero ore is sulphide and carbonate of lead, carrying gold and silver. The North Star group is below the Carbonero, and is most advantageously located for operation of both properties. They will work the two groups through the lower level of the North Star, and the tunnel will be driven ahead to intersection of the Carbonero vein at vertical depth of 1500 feet from the surface.

Governor Peabody reports that he has been asked for troops by the mine owners in Telluride district, where a strike of the miners continues, and that he has asked President Roosevelt to send the regulars from Fort Logan, as the State troops are needed in the coal districts. It is understood the mine owners want to start their mines with non-union men.

The mill at the Double Eagle group, near Telluride, of which J. H. Litchfield is manager, is completed, but as water power is to be used and there is a scarcity of water in the basin at this season of the year, it is thought the plant will not be put in operation this winter. The ore is free milling, with some sulphides. Development and stoping will be done during the winter.

Summit County.

At the Victoria mine, near Breckenridge, President Hoover of the company says construction on the mill is progressing. The main mill building will be 50x140 feet and will have twenty stamps with cyanide attachments.

Superintendent Colcord has remodeled the Excelsior concentrating mill near Breckenridge.——The Four Most M. Co., which owns properties on Chief mountain, is developing them with an adit on the Bogy.

M. Anderson has bought the Louise D. and Polly Gilpin claims, near the head of McCullough gulch, near Breckenridge. They show values in lead and gold.

Teller County.

Manager T. Cornish of Stratton's Independence, Ltd., on Battle mountain, near Cripple Creek, has 453 men at work, on two shifts. There is being shipped from the property 225 tons of ore per day, which is giving the usual values of $20 to $25 in gold per ton. All of the ore is being sent to the Black sampler at Goldfield for treatment.

The Ingham cyanide mill, near Cripple Creek, is being taken down, as the dump has been cleaned up.

The "Ella M." M. & M. Co. has been reorganized and is resuming operations on the upper tunnel on the Ella M. claim on eastern slope of Trachyte mountain, near Gillet. The old (or the lower) tunnel has been driven for distance of 208 feet. In this tunnel an ore shoot 6 feet wide was opened up of low-grade values. Tests are being made to determine if it can be successfully treated by cyanide process.

The Mine Owners' Association reports 2500 non-union men employed on their properties in the camp. The Western Federation of Miners claims there are 1600 union men still at work, while there are 300 miners working who have never been bothered as to whether they were union or non-union on properties and cyanide plants on outlying hills in the producing area. One hundred more are at work in the samplers, another 100 as ore haulers, and 100 as coal haulers and drivers of ore supplies for supply houses, and between 100 and 200 more employed by firms allied with the mining interests.

Governor Peabody has decreased the number of troops in Cripple Creek district to 200. The cavalry has all been ordered home.

The Aztec G. M. & M. Co., operating on the Elk claim on northeast slope of Mineral hill, near Cripple Creek, has put in a heavier plant of machinery and is sinking the shaft to the 300-foot point.

All of the samplers of Cripple Creek are working to their capacity. Manager N. Franklin of the Eagle sampler says that he has twenty-three men at work in the sampler, with four men in the office. The ore is coming from mines all over the district.

It is estimated, says the Cripple Creek Times, for the October payrolls there was paid out last week in Cripple Creek camp to miners, teamsters, clerks and others directly connected with the mining industry, $300,000. This is $150,000 less than prior to the strike.

IDAHO.

Boise County.

The Klondike mill on Willow creek, near Idaho City, began crushing last week. The machinery of the hoist is in place. The shaft is down 90 feet.

Idaho County.

Second payment of $30,000 is reported made on the purchase price of $100,000 for the Dundee and Glasgow mining claims on Profile creek, in Big Creek section, Thunder Mountain district, near Roosevelt. The claims were bought by a New York company.

B. J. Mack, manager of the Rankin G. M. Co., near Warren, says the flume to convey water to the mill for power has been completed and is over a mile in length. Work in the mines is progressing. Contracts for driving tunnels have been let to several parties. The sawmill has been shut down for the winter. The mill is expected to be in full operation next week.

Engineer E. S. Hesse has surveyed a road for the Iron Springs M. Co. down Rapid river, to connect with the Meadows-Grangeville road at Pollock, says the Weiser Signal. Work will be commenced on it in the spring. He reports 18 inches of snow last week at the Iron Springs camp.

Kootenai County.

The Wisconsin M. & M. Co., operating in Blacktail district, 10 miles south of Sandpoint, will put in an air compressor and drilling plant. The plant includes a 12x12 air compressor, a four-drill machine and a 50 H. P. boiler. The company has a tunnel driven 400 feet on the Mexico claim and expects to drive the bore 1 mile to develop the Mexico, Re-

bate, Mariposa, Alki Baby, Alice B, Marie, Single Jack, Currency and Broken Hill claims.——The North Dakota M. Co., which owns the Black Jack group, in the same camp, is driving an 800-foot tunnel to develop its group of claims and is in 200 feet.

Owyhee County.

T. F. Walsh of Denver, Colo., has bought the Standard mine, in South Mountain mining district, near Silver City. A company will be organized and start development and shipping ore next spring. South Mountain camp contains bodies of carbonate and galena.

KANSAS.

Allen County.

The plant of the La Harpe Smelting Co., ½ milo east of La Harpe, in Iola district, is in operation with two blocks, says the News-Herald. A third block will be built. W. Lanyon has made plans to put up a four-block plant at Caney. A gas well was recently drilled at that point, in which the pressure was great enough to blow out the string of tools. The United Zinc & Chemical Co. at Iola, and the Cherokee-Lanyon Spelter Co. at Gas have each built additional blocks during the current year. The two-block plant of Hess & Steuck at Chanute is about completed. It is reported the Edgar Zinc Co. proposes an enlargement of its Cherryvale plant.

MICHIGAN.

There are approximately 22,000 shareholders in the twenty-three Lake Superior mining companies reporting to the Michigan Mineral Commissioner, says the News.

Houghton reports to the Mining Record say the favorable weather of early November has been utilized to clear the wharves of refined copper. With the close of lake navigation the copper must be held till spring, or forwarded by all-rail routes, at an average cost of $8 per short ton greator than the mixed lake and rail freight. For several winters past copper has been shipped to the seaboard by rail until a few weeks before opening of navigation in April or May, and owing to small supplies of copper now on hand it is thought all-rail shipments will be begun before the close of the year. Despite the closing down of a number of iron mines in the Lake district and reductions in forces of many of the properties remaining active, the supply of skilled miners does not seem to increase in the copper district. There is no scarcity of common labor, but there is a shortage of experienced miners. The scarcity is not serious, but several hundred more miners could be employed to advantage.

Houghton County.

The No. 2 shaft of the Winona mine at Winona will be sunk to the sixth level during the winter. The bottom of the shaft is reported in copper ore, and the Winona continues to supply medium-grade stamp rock to the single head running thereon at the Atlantic mill.

At the Calumet & Hecla mine, at Calumet, repairs on the Red Jacket shaft are reported progressing. The October production showed a decrease, owing to this shaft being out of commission.

Work of completing No. 5 shaft at the Tamarack mine, near Calumet, is progressing. The capacity of the hoist for the mile haul is 40 tons of rock hoisted for each ton of coal consumed.

No. 2 shaft of the Franklin Junior mine, near Hancock, on the conglomerate is down 150 feet, and raising is in progress from the seventh level. The shaft house is in place. Crosscutting will be done only at the 100-feet stations.

The Isle Royale mine, near Houghton, has resumed opening of new ground at both shafts.

Product for month of October of the Baltic mine, near Painsdale, amounted to 720 tons of copper.

Ontonagon County.

The skip is running to the twentieth level in the main shaft of the Victoria mine at Victoria. The Victoria is the deepest mine in Ontonagon county, and development work continues.

The Michigan mine at Rockland is expected to begin production this week. The extension of the Mineral Range railroad to the shafts has been completed. One stamp will be used, on day shifts only, and this will crush 225 to 250 tons of rock daily, says Prosidont Stanton.

MISSOURI.

Crawford County.

M. Welton of Joplin, manager of the Missouri C. M. Co., which owns a copper mine in Crawford county, near Sullivan (Franklin county), says machinery is on the ground to open up the ground, and operations will begin before Dec. 1. The company has secured title to the lands adjoining Copper mountain, becoming sole owner of 7400 acres lying in Crawford and Washington counties.

Lawrence County.

At Stotts City, Superintendent J. Davis is putting in machinery for his mining plant on the Shipman land.——O'Grady & Rule have repaired the mill at the Illini mine and expect to begin operations this week.

Jasper County.

The Golden Rod (the Yellow Dog) mine, on the Underwriters lease, produced, from Sept. 11 to Oct. 24, 1,000,000 pounds of jack and 400,000 pounds of lead in thirty shifts. Since putting in the heavy pump, the company has had no trouble in handling the large volume of water which the mine makes, says W. R. Caulkins of Carthage, manager.

The mine and mill operators of Joplin district, in order to increase the prices of lead and zinc, which have been falling for some time, shut down their plants and mines during the first week of November. The move included the majority of the producers and had the effect of materially steadying the market. Frequent meetings of the producers have been held, says the Joplin News-Herald, but no further shut down will be made as yet. All properties are in operation at present.

W. Hogue, superintendent of the Olive plant, near Joplin, during the shut down, has put in an electric light plant. The Olive is owned by the Bash-Scogin Co. and is on the I Know ground.

The Alvina M. Co., composed of E. Zelleken, M. Dorfeldt and B. Wurzel, reports having struck zinc in deposits at depth of 112 feet at Tuckahoe.

MONTANA.

Granite County.

G. H. Babcock and D. T. Conkling have a lease and bond on the iron mines on Franklin hill, 2 miles southeast from Philipsburg, and intend shipping two carloads of ore daily to the smelters of Butte and Helena, says the Mail. The mines are owned by F. Hughes and C. Peoples, of Granite. There is a 5-foot ledge of ore which averages 50% iron, and the smelters take it for fluxing purposes. A road has been graded to the mine.

Jefferson County.

C. Baradio, J. Beaulieu and G. Vachor, of Basin, report finding coal croppings on east fork of the Little Blackfoot river, 15 miles from Basin and 2 miles from the smelter under construction by the Cataract C. M. Co., and 5 miles from the right of way of the Basin & Elliston railroad. The course of the veins is north and south. They have located several claims and have started development work. M. Westfall, of Basin, has also made several locations for Butte men.

The McCabe Co. last week started another three-compartment shaft on the Erickson group of their properties at Corbin. This, like others, will be sunk at least 500 feet. They expect to start shafts on their other groups.

Lewis and Clarke County.

The Pittsburg & Montana M. Co., which bought the Christina group of mines and claims near Austin, 15 miles from Helena, has also bought the Fanny Parnell and two other adjoining claims for $16,000. Three other claims were also taken up for surface ground. On the Christina group considerable work has been done and copper-silver ore has been shipped. They will develop and work the groups.

Missoula County.

The Du Quesne M. Co., owned by Pittsburg, Pa., men, is closed down for the winter. The mine carries values in lead, silver and copper.

NEVADA.

Elko County.

The Seigel mines, at Seigel, are shipping steadily to Salt Lake City, Utah. The manganese contained in the ores is said to make the product desirable for fluxing. Shipments are being made via Oasis, Utah, and the Salt Lake route, instead of via Wells and the Southern Pacific, as formerly.

Esmeralda County.

The suit instituted by the Tonopah Con. M. Co. to recover the Buckboard claim, which the Consolidated Co. claimed as part of the McNamara claim, at Tonopah, has been dismissed. This leaves it still in possession of the Tonopah Co.

The Tonopah Independence M. Co. of Liberty has been organized, under South Dakota laws, to operate a group of six claims 4 miles northeast of the Liberty mine and 20 miles from Tonopah. A contact ledge, between lime and porphyry and averaging 6 feet in width, has been traced and surface assays show $10 a ton, equally divided between silver and gold. C. F. Maunder is superintendent.

O'Meara & Lynch of Tonopah are reported to have bonded for $50,000 the Reveille mine, and are shipping via Sodaville.

Eureka County.

(Special Correspondence).—The Welsh-King mines, on Prospect mountain, between the Diamond and Silver Connor mines, is reported to have opened a 1-foot ledge of silver-lead ore, averaging $8 per ton.

A process of treatment on the ground is being sought for the low-grade ores of the camp. The varied character of the ores makes it difficult, but progress is reported. Among these low-grade ores are: A gold-silver-hearing quartz ledge in the Banner, assaying $9; an iron-silver quartz outcropping near the Cloud, assaying 40% iron and 13 ounces silver; scattered bodies of same in Ruby Hill tunnel; a considerable quantity of silver-lead-gold ore in limestone; oxidized iron ores assaying $6, running $2 to $4 gold, $3 to $5 silver and balance lead, are scattered through the mines in Eureka district.

The Alexandria, being worked by A. Laird et al., has made a shipment of lead carbonate carrying gold and silver.

The Avou mine, owned by A. Fraser, near the Silver Connor, has silver-lead ore assaying $6.

Eureka, Nov. 17.

Washoe County.

The Desert King M. Co. at Wedekind, near Reno, continues shipping ore. The dump is cleared up and the rock is hoisted from the 190-foot level and sacked.

NEW MEXICO.

Grant County.

The Clifton C. Co. now controls the Wildcat mine and mill at Santa Rita—the result of settling pending litigation. They will enlarge the 65-ton concentrator to 150 tons capacity. The ground is opened to depth of 300 feet, showing low-grade copper ore.

The St. Louis Gold Gulch M. Co. of Silver City, owning the Lucky Bill claim, also the Dutch Uncle and Carbonate claims at Gold Gulch, will increase development. It was decided to work and sink either on the Easton shaft or put in a double compartment shaft on the Dutch Uncle, says the New Mexican.

At the Missouri mine, 1 mile east of Central, they are unwatering the shaft preliminary to sinking and drifting. This mine was opened a year ago and high-grade ore shipped, but water interfered. It is proposed to sink the shaft at least 300 feet and drive drifts and crosscuts every 50 feet.

Work has been started by W. McAllister, lessee, on the Aztec and Arizona mines at Pinos Altos. The Aztec mine and its mill, north of Silver City, have been idle for ten years. McAllister has cleaned out the shafts and drifts of both mines. Arrangements are being made with the smelter at Silver City by which freight and treatment charges are reduced and shipping will be resumed.

Rio Arriba County.

The Glenwood M. Co., operating at Rinconada, 6 miles above Baranca station, on the Rio Grande Railroad, has completed putting up a Huntington mill, capacity fifty tons a day, with settling tanks for use of cyanide process. The equipment will later be increased.

Taos County.

Work has been resumed on the Elliott mine, in Bromide district, 12 miles west of Tres Piedras, says Superintendent F. A. Elliott.

The Frazer Mountain M. Co., at Irving, is treating seventy-five tons of ore per day and the smelter is turning out 12,000 pounds of copper matte per twenty-four hours, says W. Frazer, manager.

More men are being put to work on the Golden Treasure mine, near Red River, which has been bonded and leased by J. T. Erickson of Pueblo, Colo.——W. F. Doty is developing the Monday mine on Bitter creek, near Red River. He is taking out ore which carries copper and gold.

OREGON.

Baker County.

Development work will be increased on the Fidelity group in Wind creek section, near the Porcupine and Justice groups, near Sumpter. Manager Mohr will continue the crosscut until the vein is cut, then drifts will be run.

Josephine County.

Considerable work is being done on Foots creek, near Grants Pass, by Champlin & Co. They are building a dredger, by which the gravel bed of Foots creek and much of the lower benches and bars will be worked. The company is building a dam across the creek near the river to raise the water of the stream for the required depth for dredging. Machinery for the dredger is on the ground. The Champlin Co. has bought 1200 acres of placer ground. Dredging will also be done this season on the Illinois and other southern Oregon streams.

The Yellow Jacket mine, of Foots Creek district, near Grants Pass, has been bought by G. A. Dyson of Eugene for Orme, Shaffer, Mears & McIntyre. Dyson will continue development of the Yellow Jacket.

The Eureka mine of Soldier Creek district, near Grants Pass, has reverted to its former owner, A. F. Nelson, who is arranging to increase development work. The Eureka is equipped with a 10-stamp mill, steam hoists, air compressor and other machinery. The ledge has a width of 6 feet and carries values in sulphurets and free gold of $15 a ton. It is opened to a depth of 150 feet.

The Monumental quartz mine, near Waldo, has been bonded by the Waldo S. & M. Co. and will be developed. The Monumental is a base proposition, the quartz carrying arsenical pyrites. The ledge of the Monumental is said to be 50 feet in width. It is being developed by an inclined shaft, from which drifts and crosscuts are run on the vein. The ore will require a concentrator.

Jackson County.

The Bill Nye M. Co., operating on Gall's creek, 3 miles south of Gold Hill, will increase work the coming season. They have a 5-stamp mill and hoist on the ground, which will be placed in position, says Superintendent D. R. Andrus. The company has an 80-foot shaft, besides tunnel and drift work. The ore is free milling.

SOUTH DAKOTA.

Lawrence County.

The Golden Crest mill, in Two Bit gulch, near Deadwood, is in full operation after being enlarged. It is treating forty-eight tons per day. The ore shows average of $18 per ton and an extraction of 85% has been obtained. Five stamps were added, bringing total to ten.

The Reliance G. M. Co. is working steadily its group on Annie creek, near Terry, developing its ground and excavating for the mill. Two tunnels are being driven, one being in 400 feet and the other 320 feet. They are connected for ventilation. R. Fitzgerald is mine superintendent.

TENNESSEE.

Knox County.

It is reported the Roseberry Zinc Co. has decided to shut down its mill at Mascot because of its inability to dress the ore properly. The mill is of the Joplin type, but is said not to be adapted to the refractory Mascot ore, as the zinc ore of the Joplin, Mo., district is more easily concentrated.

UTAH.

Beaver County.

From the Cactus group of mines, near Frisco, there will be forwarded to the furnaces of the American S. & R. Co. ores to the value of $10,000,000, says S. Newhouse, owner. The ore carries copper, gold and silver values. The contract provides that the delivery of Cactus ores shall begin as soon as the furnaces of the copper plant projected by the American Co. at Murray are completed. The Cactus will also supply the furnaces with 100 tons daily of concentrates from the mill. Newhouse will build a concentrator which will have a capacity for reducing 1500 tons of ore daily.

The initial shipment of copper matte from the Majestic Co.'s smelter at Milford showed value of $125 a ton, says Manager Alexander. The shipment was of twenty tons.

Grand County.

At Castleton the Finley G. & C. M. & M. Co. is resuming mining operations to continue through the winter, says C. A. Finley, manager. The Finley Co. is of Colorado Springs, Colo., men, with C. A. Fitch, president. It owns three claims at the foot of Horse mountain.

A merger has been formed in Salt Lake City whereby the Dirigo-La Sal and International companies were united in the Dirigo-La Sal, operating in Beaver basin and Deep creek, near Basin. D. H. McCann, manager, has let a contract for running a tunnel on the Beaver basin group. Next season they will begin operations on both the Deep creek and Beaver basin properties and at the same time prepare for building reduction works on Deep creek.

Machinery for the Inter-State cyanide mill in Gold basin, near Basin, is on the ground, says J. H. Clark, manager.

The list of working properties this winter in Basin district in the La Sal mountains will include the Grouse Mountain, Skylark, Iowa and Monarch, Findley, Dirigo-La Sal, Inter-State, and possibly the Mineral Mountain Tunnel and Colorado properties. A company, the Midland Belle, has been organized.

Carbon County.

It is reported the coal miners at Castle Gate have gone out on a strike in sympathy with the miners in Colorado, and it is thought the strike will spread to all the principal coal mines in Utah. The Utah Fuel Co., controlling most of the Utah mines, is under contract to supply the Southern Pacific Railroad with not less than 1000 tons of coal a day. This contract has been running as high as 3000 tons, besides the coal shipped to the coast for commercial purposes. At present about one-third of the miners at Sunnyside are out.

Iron County.

The Colorado Fuel & Iron Co. has increased its number of men at work in its iron mines, near Cedar City, to 100. Work is being projected all along the iron zone on the company's holdings, a distance of 11 miles. This work consists in sinking shafts to determine extent of the iron deposits. Six of these shafts are being driven. As the ore is taken out tests are made of its quality and character and a record kept. All the shafts, while experimental, are so driven that they can be used when the actual taking out of ore in quantity is reached.——Manager Milner of Salt Lake City says he has men at work on his properties, which adjoin those of the Colorado Co.

W. H. Wobber of Colorado Springs, Colo., manager of the Interstate M. & R. Co., says he will begin development work on their Good Hope group, seven claims and a fraction, near Stateline. It is ¾ of a mile from the Johnny and Ophir properties. He is backed by Pennsylvania and Milwaukee, Wis., men, with L. B. Wolf of Lewisburg, Pa., president.

Salt Lake County.

The Maxwell group, near Bingham, is connected by pipe line with the Yampa mine compressor and machine drilling has superseded hand work.

The Boston Con. mine at Bingham will be equipped with electricity. An electric mine locomotive will be used and the underground workings will be lighted with incandescent lamps.

WASHINGTON.

Ferry County.

(Special Correspondence). — Republic smelters are overcrowded. Work is to be resumed on the Chico, Lone Pine and Surprise. Tests are being made on Quilp, Lone Pine-Surprise and Mountain Lion ores with a new cyanide method. Total October shipments were 4640 tons.

The Bolchor has a large body of solid ore—an iron sulphide carrying copper and gold—the class of ore necessary to use with the ores of Republic to make a proper flux.

Republic, Nov. 16.

The Six Eagles tunnel, near Republic, is in 1620 feet and is being driven at rate of 5 feet per day. The face is in sandstone and considerable water is coming in. It is expected the ledge will be struck at depth of 800 feet. There are twelve men working at the mine. —— There are twenty-one men at work on the Ruby mine, blocking out ore to stope when the Golden Zone mill starts up. There are 1200 running feet of workings in the mine. The north drift on the lower tunnel is in 300 feet and the south drift is in 325 feet. The Golden Zone mill will be ready by Nov. 26.——At the Similkameen falls the tunnel is completed, and will be ready to turn the water in and run the impact wheel before the rest of the machinery is set up.

Okanogan County.

F. C. Lavigne of Spokane, superintendent of the Black Bear stamp mill, near Loomis, leased to the Pinnacle G. M. Co., says he increased the speed and lessened the drop of the stamps. The result has been that the plant has handled 50% more ore daily than formerly and has saved 90% of the values. The first clean-up since resuming was made last week, after a short run, proving satisfactory.

Controlling interest in the Wild Jack mining claim has been bought by E. Boling of Spokane, and its name changed to Cornucopia. Boling has bought an interest in the Chloride and Cleopatra mines also. He says development work will be increased. The ores carry copper, gold and silver. There are 10 feet of quartz, and 2½ of it is shipping ore. The mines are 6 miles from Riverside, and the ore will be hauled to Riverside at $2 a ton. There it will be sent down by boat to Brewster, where it will be transferred to the steamer and shipped to Wenatchee, and from there by rail to Everett or Tacoma.

Snohomish County.

D. Guggenheim, chairman of the board of directors of the American S. & R. Co., says they expect to reopen the smelter at Everett.

Stevens County.

Work has been resumed on the Kemp-Kemar C. M. Co. group, near Loon Lake, and shipments are expected to begin by Dec. 1st. The mines are 6 miles from Loon Lake. The ore runs 15% in copper.

Superintendent J. J. Moynahan of the Conquest Con. M. Co., operating near Nowport, says a hoisting plant was put in the past summer and development is being increased. He has twenty men at work and the shaft is down 135 feet.

WYOMING.

Carbon County.

The North American C. Co.'s smelting and converting works at Grand Encampment resumed operations on the 15th inst. after a temporary shut down. The blister copper being turned out for the Eastern refineries carries $20 to $30 in gold per ton, which is sufficient to pay charges from smelter to market. The aerial tramway between the smelter and the Ferris-Haggerty mine has not been in steady operation because storms damaged the towers, but these have been repaired and a steady run is expected.

FOREIGN.

AFRICA.

Transvaal.

London advices of the 12th inst. state that within ninety days a bill will be passed and arrangements will have been completed for introduction of Asiatic labor into the South African gold mines. There are now employed in those mines 65,000 men, whereas there is need of at least 200,000.

AUSTRALIA.

Queensland.

At the Mount Morgan G. M. Co. at Mount Morgan a steam shovel will be used to remove the overburden and is expected to lessen the cost, as well as lessen the time required to remove it.

Western Australia.

The official report of the Department of Mines for the year 1902 shows the total mineral output valued at £8,094,617, being an increase of 9% as compared with the value for 1901. The value of the output of minerals other than gold represents 1.8% of the total mineral production. Western Australia's gold output was 53¾% of the total amount produced by all of Australia. The land leased for gold mining was 32,570 acres; men engaged in gold mining, 20,475; population of State, 214,805; gold output, £7,947,662, being 1,871,037 ounces fine, exceeding that of 1901 by 167,620 ounces. The increased output is general throughout the districts. In the East Coolgardie field, especially, the mines on the Golden Mile are being proved by deep sinking and diamond drilling.—— The output of black tin for the year was £39,783, the two producing districts being Greenbushes and Pilbarra. —— As compared with 1901, production of copper ore was less by 7698 tons. The decrease was due mainly to suspension at the smelters at the Anaconda mine, in Mt. Margaret field.——The only coal-producing field was the Collie, its output being 140,884 tons, about 23,000 tons in excess of 1901. Coal prospects are being exploited near Mingenew, in Irwin River district. A diamond drill is in operation.——There were 22,424 ounces fine of silver, of value of £1581, produced as a by-product. —— Small quantities of cobalt, plumbago and silver-lead ore were obtained, but no precious stones, during the year.——Tables giving the average number of men employed at the mines during the year show the number has increased by 1070 on the gold mines, while less are employed on all other mines, bringing the total down to 315 more than in 1901. The number of alluvial workers has shown a steady falling off for several years past. The total number of men killed was 39, as against 45 in 1901, and injured 132, as against 130, all the mining accidents occurring in the gold fields.——Of State batteries, the report says: In all £117,600 have been expended in their erection, equipment and necessary water supply during six years. During the year 1902 there were 39,517 tons of stone treated by the batteries, yielding 57,255 ounces.

BRITISH COLUMBIA.

Boundary District.

Ore shipments from the Boundary district for the month of October amounted to 73,256 tons, as against 61,388 tons for September and 69,968 tons in August. Shipments for the year to November 1st aggregated 532,383 tons.

Cariboo District.

Surveys are completed at the Con. Cariboo hydraulic mine at Bullion for extension of the company's water system. Estimates of the cost of tapping these water reserves are being made by Manager J. B. Hobson. It is reported that Morehead lake is 2 feet higher than it was last spring when the water was turned on in the pits.

At Eight-mile lake the Thistle gold mine is reported to have made its final clean-up for the season, yielding a total of $50,000. The property is owned by P. Sutherland & Co. It has been worked three seasons.

East Kootenay District.

The Chu-Chee-Woo, a Chinese company, working placer holdings on Wild Horse creek, north of the Nip & Tuck, near Fort Steele, has finished work for this season.——Owing to lack of water, most of the companies on Wild Horse creek had started to clean up for the season, but recent rains increased the water supply to such an extent that mining operations have partially been resumed.——The Gold River M. & P. Co. is cutting a right of way for a flume 16 feet wide and 5 feet deep, 2 miles in length, to convey water of Bull river to the auriferous ground near Fort Steele. Giants, flumes, sluice boxes, etc., will be put in next spring.

Rossland District.

At the White Boar mine, near Rossland, development in the deep levels has been carried ahead steadily, and ore is being hoisted from the 1000-foot level. The spur from the main line of the Red Mountain road was completed last week. The hoisting machinery is being set up at the headworks.

Ore shipments from Rossland camp for month of October aggregated 38,151 tons, as compared with 39,651 tons for September and 36,010 tons for August. Shipments for the year to November 1st reached 330,574 tons.

Vancouver Island.

The foreign coal shipments from the mines at Ladysmith for the month of October reached a total of 22,795 tons.

The Western Fuel Co. has struck in the southern end of No. 1 mine at Nanaimo a seam of 10 feet of workable coal, giving that part of the workings new prospects. At the new slope at Departure Bay the pumps are controlling the water situation. The foreign shipments of the Western Fuel Co. for month of October aggregated 14,344 tons of coal.

The Government has decided that the Chinese must get out of the coal mines. Premier McBride says an attempt will be made to stop the coal companies employing Chinese underground, they being considered unsafe workmen there. The former action was balked by the Dunsmuir company taking the matter through the Canadian courts and getting a decision in its favor with the judicial committee in London. Since then a new law has been passed to deal with the matter. J. Dunsmuir, owner of the mines, says this will be fought in the same way. Action will be started this week. Inspector Morgan has summoned the superintendent of the mines at Cumberland, and the company will be condemned to pay a fine, as the employment of Chinese is not denied. An appeal will be taken, and the matter will go to the Supreme Court. From there it will go to Ottawa, and eventually it is expected to go to Downing street, London.

Yale District.

J. Redman of Kamloops says the Boulder Creek M. Co. is operating a number of mining propositions in Copper mountain, Similkameen and Aspen Grove sections. The Nickel Plate and Cousin Jack claims carry large ore bodies of low-grade copper ore. The Nickel Plate Co. is building plants for treatment of the ore. Machinery for a cyanide plant and a 40-stamp mill is on the ground.

COLOMBIA.

(Special Correspondence).—At the Espiritu Santo mine at Cana, on the Isthmus of Panama, the ground has been opened up to depth of 600 feet. The ore body has been stoped out from the 500-foot level to the surface and filled. The ore shoot is getting narrower and longer with depth, but maintains its values. The ore contains considerable sulphides, which are low grade. Manager Proctor is sinking a new incline shaft, which is expected to cut the ore body at depth of 1500 feet. This shaft is in the foot wall, to one side of the ore body, and is going down at nearly the same angle as the lode.

The 20-stamp mill is in steady operation. It is equipped with Frue vanners. The cyanide plant handles the concentrates. Water power is used, running five impact wheels and one turbine, which, in addition to the mill and hoist, operate a sawmill, machine shop and electric light plant. The tailings are impounded; 90% of the values in the ore are recovered by amalgamation.

Cana, Nov. 1.

CUBA.

Havana reports several hundred men thrown out of work by the closing of the iron mines in Santiago province. These mines were formerly owned jointly by the Pennsylvania Iron Co. and the Bethlehem Iron Co., but now owned by the latter.

CANADA.

Ontario.

The lode at the Sultana mine, in Lake of the Woods district, near Wabigoon, trace of which had been lost, has been recovered and development work increased. The mill will be operated.

CHINA.

Manchuria.

Vladivostok reports a joint stock company being organized there with a capital of $3,000,000 to operate the tin mines of Manchuria, the promoters hoping to break the Anglo-American monopoly.

MEXICO.

Chihuahua.

E. A. Horner of Chihuahua, who has an option on the Santo Domingo placers on Conchos river, reports the Mexican Gold Fields Co. organized under Arizona laws to take over the property. Horner says he expects to begin operations by Jan. 1.

The Encinillas M. Co., Ltd., has completed its smelter at Santa Rosalia, on the line of the Central railway, consisting of a 50-ton matte furnace and a 50-ton lead furnace. The plant is expected to blow in this week. The foundations for a 20-ton stack furnace have been laid.

The Industrial M. Co., of Bascurito, is preparing to irrigate 600,000 acres of land. A canal is being built and a dam across the Sinaloa river, to secure water supply. Hydraulic machinery will be put in to operate the placer mines of the company along the river.

Hidalgo.

La Union reduction works at Pachuca reports having on hand $100,000 worth of ores and has made a contract with the San Rafael y Anexas group, which includes the Soledad and Sorpresa mines, for all their ores.

Lower California.

It is reported the Ybarra G. M. Co. of San Francisco, Cal., has sold its group of mines at Calmalli, near Santa Domingo, to a company of London men for $100,000.

Personal.

W. D. CAMERON of New York is in San Francisco, Cal.

W. W. OCHS of Salt Lake City, Utah, is in the East.

GEO. SANDERS has returned from New York to Wickenburg, Ariz.

H. E. PICKET of Placerville, Cal., is in San Francisco on mining business.

PHILIP ARGALL has returned to Denver, Colo., from a trip to Montana.

F. E. SHAW of Butte, Mont., is in San Francisco, Cal., on mining business.

W. A. ROBERTS is in San Francisco, Cal., from mines in Grants Pass, Or.

E. C. LIMBACH is located at Gilt Edge, Mont., where he has charge of a mill.

C. A. YOUNG, interested in Nome, Alaska, mines, is in San Francisco, Cal.

G. CLARK of Minas Prietas, Sonora, Mex., is superintendent of the Lapiz mine.

P. WHITE has resigned as superintendent of the Broken Hill M. Co. at Ymir, B. C.

A. H. TUTTLE is secretary and manager of the Broken Hill M. Co., at Ymir, B. C.

B. L. JONES is manager of the Josephine mine at Cusihuariachic, Chihuahua, Mexico.

T. CLARK, interested in El Dorado Co. mines, is in San Francisco from Placerville, Cal.

L. R. MCINTOSH has resigned as superintendent of the Jubilee M. Co. at Carl Junction, Mo.

A. W. KEDDIE of Oroville, Cal., interested in Butte county mines, is in San Fraucisco, Cal.

F. F. THOMAS, E. M., manager of the Gwin mine, Calaveras Co., Cal., is in San Francisco, Cal.

C. F. MAUNDER is superintendent of the Tonopah Independence M. Co., near Tonopah, Nev.

H. P. STOW of the Gold Bank mine, Forhestown, Butte Co., Cal., is in San Francisco, Cal.

H. W. TURNER returned to San Francisco, Cal., from mine examinations in Orogon, and has gone to Calaveras county, Cal., to examine a gold mine.

E. C. VOORHIES of the Pioneer Reduc-

tion works at Sutter Creek, Cal., is in San Francisco, Cal.

J. HANLON has returned to the Crown Point mine, near Phœnix, Ariz., from a visit to Europe.

F. H. LATHROP of Salt Lake City, Utah, has gone to Tonopah, Nev., to locate permanently.

T. E. SCHWARZ, Denver, Colo., is in Brookline, Mass., called there by the death of his father.

A. B. GOULD of Placerville, Cal., interested in El Dorado county mines, is in San Francisco, Cal.

J. M. SHERRARD, manager of the Taylor Iron & Steel Co., Highbridge, N. J., is in San Francisco, Cal.

MANAGING DIRECTOR A. F. HOLDEN of the United States M. Co. is in the East from Salt Lake City, Utah.

C. H. DUNTON of Placerville, Cal., superintendent of the Eureka Slate Co. at Kelsey, is in San Francisco, Cal.

W. LOGAN is superintendent of field work for the Western Union Oil Co., operating near Santa Barbara, Cal.

H. CONDER is in temporary charge of the Crowl Creek copper mine, Shuttleton, near Cobar, New South Wales.

W. C. CAPEN has assumed the management of the West Coast Rubber Co., 102 First street, San Francisco, Cal.

C. E. BUNKER, superintendent of the Sultan mine at Hillside, Ariz., is in Chicago, Ill., on company business.

B. N. LEHMAN of Salt Lake City, Utah, of the Yankee Con. Co., left last week for Juneau, Alaska, on mining business.

H. Z. OSBORNE of Los Angeles, Cal., president of the Dorleska mine, Trinity county, Cal., is in San Francisco, Cal.

H. ANDREWS, operating in Bear gulch, near Jardine, Park county, Mont., is at the mines from Salt Lake City, Utah.

JOHN ROSS, JR., superintendent of the Wildman-Mahoney mine, Sutter Creek, Cal., is examining mines at Grants Pass, Or.

J. D. WOOD of Salt Lake City, Utah, of the Daly-West M. Co. and the Daly-Judge M. Co., is in San Francisco, Cal.

W. F. FREMERSDORF, metallurgical engineer and chemist, late of Vancouver, B. C., has established an office in San Diego, Cal.

R. A. PARKER, E. M., has entirely recovered his health and has office headquarters at 217 Boston Building, Denver, Colo.

W. E. POMEROY, general superintendent of the Yaqui C. Co., returned to Campo Santo Nino last week from New York.

M. WELTON of Joplin, Mo., is manager of the Missouri C. M. Co., operating in Crawford Co., Mo., near Sullivan, Franklin Co.

W. THOMPSON, general manager of the Rossland-Kootenay M. Co., returned to Rossland, B. C., last week from a trip to Mexico.

J. E. BAMBERGER of Salt Lake City, Utah, principal owner of the Daly-West mine at Park City, Utah, is in San Francisco, Cal.

FRANK DAVIS, manager of the Yaqui River S. & R. Co., returned last week to Toledo, Sonora, Mex., from San Francisco, Cal.

J. H. HUTCHINSON of Boise, Idaho, is in Boise after a trip to the tiu mines on Seward Peninsula, Alaska, in which he is interested.

M. H. CAVANAUGH, formerly of Webb City, Mo., is manager of the Northwestern Zinc Corporation's properties at Galena, Mo.

C. C. DERBY, manager of the mines of the Mariposa Estate Co. in Mariposa county, is in San Francisco from Mt. Bullion, Cal.

W. RODGERS of Georgetown, Colo., is manager of the Hazelton G. M. & M. Co., operating in East Argentine district, Clear Creek Co., Colo.

J. B. TREGLOAN, superintendent of the South Spring Hill mine, south of Amador City, Cal., is in San Francisco, Cal., on mining business.

P. B. AIKEN of San Francisco, Cal., president of the Amador Climax G. M. Co., is at their mines near Pine Grove, Amador Co., Cal.

W. G. AMENT, manager of the Golden Drift M. Co., near Grants Pass, Or., returned there last week from a trip East on company business.

A. B. LEWIS, manager of the Royal, Imperial and other Utah properties, returned to Salt Lake City, Utah, last week from an extended trip East.

E. S. KESKEYS, for the past four years connected with the Ishpeming M. Co. at Carl Junction, Mo., is superintendent of the Juhilee M. Co. at the same place.

W. L. WATTS, E. M., of Los Angeles, Cal., is in San Francisco, Cal. He leaves shortly for Texas and Mexico, where he will make oil and mine examinations.

J. H. HAMMOND, consulting engineer for the Guggenheim Exploration Co., and J. W. Brock, president of the Montana M. Co., are in San Francisco, Cal., from Denver, Colo.

J. W. BENNY, who has been in charge of the company's smelter for the past two years, is general manager of the Shannon C. Co. at Clifton, Ariz., vice H. S. Anderson, resigned.

JOHN SPARREY of Portland, Or., has been appointed superintendent of the coal mines of the Portland Coal & Dev. Co., near North Yamhill, Or., vice W. Steadman, resigned.

C. B. LAKENAN of Grass Valley, Cal., has resigned as superintendent of the Coe mine and has gone to Arizona as superintendent of the Mohave G. M. Co. mines, near Needles, Cal.

H. L. CORNISH has resigned as superintendent of the La Grange D. & M. Co., at La Grange, Cal., and is in Berkeley, Cal. He will go to Durango, Mexico, about December 1st.

JAS. CONSTABLE, now at Seattle, Wash., has just finished an engagement with the Coronation M. Co., in the development of a silver-lead property in southeastern Alaska.

WM. STEADMAN, who has been superintendent and manager of the coal mines near North Yamhill, Or., for the past two and one-half years, has resigned, on account of age and poor health.

H. S. ANDERSON, general manager of the Shanuon C. Co. at Clifton, Ariz., for the past two years, has resigned to devote his time to his private business and will make El Paso, Tex., his hoadquarters.

W. H. WEBBER of Colorado Springs, Colo., recently superintendent of the Rambler M. & S. Co. of Wyoming, is manager of the Good Hope group of the Interstate M. & R. Co., at Stateline, Utah.

Z. F. RAWSON, vice-president of the Santa Ana M. & M. Co., has resigned the superintendency of the Lapiz mine, near Nogales, Ariz., and will devote his time to the Santa Ana properties near Sahuaripa, Sonora, Mex.

W. S. MANN has resigned as mill superintendent of the Nobles G. M. Co., near Descanso, San Diego Co., Cal., to take a similar position with the Ventanas M. Co., operating cyanide plants at Villa Corona and San Cayetana, Durango, Mex.

C. E. ALLEN has been appoiuted general superintendent of all the mines of the United States M. Co. in Utah. Heretofore he had charge of only the Centennial-Eureka, in Tintic district, but will now have the Bingham properties as well.

THE following officers have been elected for the ensuing year by the California State Miners' Association: Chas. M. Belshaw of Antioch, Cal., re-elected, president; H. P. Stow of Forbestown, vice-president; S. J. Hendy of San Francisco, treasurer, re-elected: E. H. Benjamin of San Francisco, secretary, re-elected.

ROBERT McF. DOBLE, consulting engineer, has returned to San Francisco, Cal., after an absence of several months in Mexico, having completed the installation of the hydro-electric power plant and transmission of the Guanajuato Power & Electric Co. The transmission is from the Duero river to the city of Guanajuato, a distance of 101 miles, at 60,000 volts. The line is constructed of No. 1 B. & S. hard drawn 19-strand copper cable, supported by porcelain insulators, iron pins, steel cross-arms and steel towers, there being usually only twelve towers per mile. The uormal span is 440 feet, although in some cases spans of over 1300 feet are used.

Obituary.

J. A. MATTHEWS, a pioneer miner of Montana, died at Phillipsburg, Mont., on the 6th inst., the result of heart trouble. Deceased was a native of Watertown, N. Y., 66 years of age. During the Civil war he served with the army of the Potomac. Early in the '70s he went to Montana and engaged in placer mining at Yam Hill, Pioneer and Henderson Gulch.

D. J. BURNETT, a pioneer miner, and son of the late P. H. Burnett, first Governor of California, died on the 17th inst. at San Francisco, Cal., due to age and general debility. Deceased went to Oregon in 1843, and six years later moved to California. He engaged in mining and mercantile business at different times. He leaves a widow, four sons and two daughters. Deceased was a native of Tennessee, 74 years of age.

Commercial Paragraphs.

THE S. S. Machinery Co., Sixth and Market streets, Denver, Colo., are moving their place of business to Twenty-fifth and Larimer streets, where they will have larger and more commodious quarters.

C. M. FUELLER, mining engineer, 1752 California street, Denver, Colo., is designing a large mill for D. G. Cahoon, manager of the Dexter M. & D. Co. of Atlantic City, Wyoming, and also expects to take the contract for designing the Hazelton mill at Georgetown, Colo. Mr. Fueller states he is having a great deal of experimental or testing work to do at present. He has a fully equipped plant for testing ores up to carload lots.

THE National Wood Pipe Co. of Los Angeles, Cal., has just completed the construction of eight lines of 48-inch diameter, and one line of 18-inch diameter wood stave pipes, to be used as pen stocks for the Columbia River Improvement Co., near Tacoma, Wash., the staves for this pipe being made from Washington Douglass fir. This company reports now building two parallel lines of 36-inch diameter redwood stave pipes for pen stocks for the American River Electric Co., near Placerville, Cal., all of the above lines being built under the Wheeler patent for continuous stave pipe. The company also reports building several miles of 4, 8 and 10-inch Woodward patent machine banded redwood water pipe for the city of Oceanside, Cal., and that the work has been tested and accepted by the city of Oceanside. The pipe was made for a maximum pressure of 200 feet.

THE Wellman-Seaver-Morgan Co. have closed a coutract with the John Cockerill Co., of Seraing, Belgium, whereby they acquire from the Cockerill Co. the exclusive right to manufacture and sell in the United States the Cockerill type of gas engine. These engines they state to have been in successful use throughout Europe for a longer time than any other design of large unit gas engines; they further state that the horse power of this type in satisfactory and successful operation in Europe is larger than all other types of gas engines combined. By virtue of this contract with Messrs. Cockerill & Co. they obtain the exclusive right to manufacture and sell, and also acquire all of the drawings, plans and other information of the Cockerill Co., as well as the benefit of their experience in the manufacture and use of these engines. An especially valuable feature of the connection is the fact that the Cockerill Co. have their own blast furnace, steel works and rolling mills in connection with their engine building shop, making it possible for them to test every new type and modifications of the engines they build, in actual work, before sending them out to their customers. The Wellman-Seaver-Morgan Co. state that these engines are suitable for any of the uses for which large power units are required, such as blowing engines for blast furnaces and steel works purposes, electric power plant for both alternating and direct current, rolling mill work, and in fact all places requiring heavy, severe and continued service. With the gas engines, the Wellman-Seaver-Morgan Co. state that they are prepared to furnish complete installation of the necessary accessories, such as cleaning, purifying and regulating apparatus, that their Cleveland and Akron works are admirably adapted for the manufacture of this class of work, as regards large and powerful tools, cranes, etc., especially their Webster, Camp & Lane Division at Akron, which for many years has been engaged in building high-grade Corliss and other steam engines.

Catalogues Received.

High-grade turbines are the subject of a handsome trade treatise issued in English, Italian and Norwegian by the Trump Manufacturing Co., Springfield, Ohio.

"The Hot-Blast Stove and Its Application to Copper and Pyritic Smelting," is the latest contribution made by the Colorado Iron Works Co. of Denver, Colo., to modern metallurgy. It does not claim to be anything more than a collection or compilation of papers, articles and abstracts from letters to customers, written at various times, on smelting practice and equipments, but is none the less valuable in its present shape.

Latest Market Reports.

SAN FRANCISCO, November 20, 1903.

METALS.

SILVER.—Per oz., Troy: London, 27½d (standard ounce, 925 fine); New York, bar silver, 58⅜c, refined (1000 fine); San Francisco, 58⅜c; Mexican dollars, 46@47½c San Francisco, 44⅜c New York.

During the past week silver has been unsettled, though showing an upward tendency, being nearly 2 cents higher now than in last week's quotations.

COPPER.—New York: Standard, $13.00; Lake, 1 to 3 casks, $13.00; Electrolytic, 1 to 3 casks, $13.00; Casting, 1 to 3 casks, $13.00; San Francisco: $15.00. Mill copper plates, $17.00; bars, 18@24c. London: £55 15d spot per ton.

Copper shows a slight falling off in price from last week's quotations. Following are the figures of German consumption of foreign copper for the months January-September, 1903, compared with the same period of 1902-1901, in tons:

	1903.	1902.	1901.
Imports	63,527	62,091	48,755
Exports	7,797	6,718	7,233
Consumption	55,730	55,373	41,522

LEAD.—New York, $4.25; Salt Lake City, $3.50; St. Louis, $4.00; San Francisco, $4.50, carload lots; 4⅜c 1000 to 4000 lbs.; pipe 6½, sheet 7, bar 5⅜c; pig, $4.75. London: £11 11s 3d ₱ long ton.

SPELTER.—New York, $5.75; St. Louis, $5.10; London, £21 ₱ ton; San Francisco, ton lots, 6⅜c; 100-lb. lots, 7c.

TIN.—New York, pig, $25.10 @ 25.50; San Francisco, ton lots, 27c; 500 lbs., 28c; 200 lbs., 28c; less, 28½c; bar tin, ₱ lb., 30@32c. London, £116 7s 6d.

PLATINUM. — San Francisco, crude, $18.00 ₱ oz.: New York, ingot, $19.00 ₱ Troy oz. Platinum ware, 75 @ 80c ₱ gram.

QUICKSILVER. — New York, $46.00@47.00, large lots; London, £8 7s 6d; San Francisco, local, $43.50@44 ₱ flask of 76½ lbs.; Denver, $49.50. Export, $42.50@43.00.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 35c; Eclipse, 37½c.

SOLDER. — Half-and-half, 100-lb. lots, 18.00c; San Francisco, Plumbers', 100-lb. lots, 15.25c.

ZINC.—Metallic, chemically pure, ₱ lb., 50c; dust, ₱ lb., 10c; sulphate, ₱ lb., .04c.

NICKEL.—New York, 50@60c ₱ lb.; ton lots, 40@47c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30@34c.

ANTIMONY. — New York, Cookson's, 7½c; Hallott's, 6⅜c; San Francisco, 1000-lb. lots, 8c; 300@500-lbs., 8½c; 100-lb. lots, 10½c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, $15.85 @16.10; gray forge, $13.50; San Francisco, bar, 3c ₱ lb., 3½c in small quantities.

STEEL. — Bessemer billets, Pittsburg, $23.00@25.00; open hearth billets, $23.00 @26.00; San Francisco, bar, 7c to 12c ₱ lb.

LIME.—Santa Cruz, $1.60 country, $1.75 city ₱ bbl.

CEMENT.—Imported, $2.50@2.75 ₱ bbl.: California carload lots, $2.25 f. o. b. at works; small lots, $2.50 ₱ bbl. in sacks, 4 sacks to bbl.

GENERAL SUPPLIES.

OILS.—Linseed, boiled, bbl., 49c; cs., 54c; raw, bbl., 47c; cs., 52c; Lucol oil boiled, bbl., 44c; cs., 49c; raw, bbl., 42c; cs., 47c. Kerosene—Pearl, per gal., 22c; Astral, 22c; Star, 22c: Extra Star, 26c; Eocene, 25c; Elaino, 28c; Water White, in bulk, 15½c; Mineral Seal, iron bbls., 19c; woodon bbls., 21½c; cs., 25c; Mineral Sperm, cs., 26½c.; Deodorized Stove Gasoline, bulk, 17c; do., cs., 23½c; 86° Gasoline, bulk, 21c; do., cs., 27½c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 13c; do., in cs., 19½c; Lard Oil, E W. S., bbl., 85c; cs., 90c; Neats-foot Oil, pure, bbl., 75c; cs., 80c; Sperm, crude, 50@60c; Natural White, 70c; Bleached, do., 75c; Whale Oil, cs., 50@55c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per ℔., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2.00 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Triple tape, $3.60 per 1000 feet; double tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11c ₱ set; 14 oz., 40s., 10c.

COAL. — San Francisco, coast, yard prices: Wellington, $8.00; Seattle, $6.50; Coos Bay, $5.50; Southfield, $8.00. Cargo lots, Eastern and foreign: Wallsend, $7.50; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8.00; Cumberland, $13.00; Cannel, $8.50; Welsh Anthracite, $13.00; Rock Springs, $8.50, long ton; Colorado Anthracite, $14.00. Coke, $10.50 per ton in bulk, $13.00 in sacks; Sunnyside, $8.50, long ton.

CHEMICALS. — Cyanide of potassium, 98%–99%, jobbing, 23@24c ₱ ℔.; carloads, 23@23½c; in tins, 30c; soda ash, $2.00 ₱ 100 ℔s.; hyposulphite of soda, 3@3½c per ℔.; caustic soda, in drums, 3@3½c ₱ ℔.; Cal. s. soda, bbls., $1.20@1.40 ₱ 100 ℔s.; sks., $1.05; chlorate of potash, 12@13c; nitrate of potash, bbls., 10c; caustic potash, 10c in 40-℔. tins; roll sulphur, 2½@2¾c; powdered sulphur, 2@3c; flour sulphur, French, 3½@3¾c; alum, $2.00@2.25; California refined, 1¾@2c; sulphide of iron, 8c ₱ ℔.; copper sulphate, 5½@5¾c; chloride of lime, spot, $2.50@2.75; sulphuric acid, in carboys, 66% B, 1¾@2c ₱ ℔.; nitric acid, carboys, 8c ₱ ℔.

BONE ASH.—Extra No. 1, 5@6c ₱ ℔. No. 1, 4@5c.

WHITE LEAD.—Per ℔., in kegs: 500 ℔s. and over at one purchase, per ℔., 6½c; less than 500 ℔s., per ℔., 7c; in 25-℔. tin pails, ½c ₱ ℔. above keg price; in 1 and 5-℔ tin cans, 100 ℔s. per case, ½c. per ℔. above keg price. Dry Lead—In bbls., 1 ton and over, 6½c; do. in kegs, 7c.

RED LEAD.—500 ℔s. and over at one purchase, ₱ ℔., 6½c; less than 500 ℔s., 7c.

LITHARGE.—Pure, in 25-℔. bags, 8@9c ₱ ℔.

BORAX.—Concentrated, 6@7c ₱ ℔; powdered, 8@10c; fused, 20@25c; crystal, 7c; calcined, 25c.

MANGANESE.—Pure, ₱ ℔., 60c.

SODIUM.—Metal, ₱ ℔., $1.00.

BISMUTH.—Subnitrate, ₱ ℔., $1.75.

MERCURY.—Bichloride, ₱ ℔., 90c.

MOLYBDENUM.—$2.00 ₱ ℔.

CHROMIUM.—90% and over, ₱ ℔., $1.00.

PHOSPHORUS.—American, ₱ ℔., 75c.

SILVER.—Chloride, ₱ oz., 90c@$1.00; nitrate, 55c.

ALUMINUM.—No. 1., 99%, small lots, 37c ₱ ℔.; 100 ℔s., 35c; 1000 ℔s, 34c; ton lots and over, 33c, Pittsburg. No. 2, 90%, small lots, 34c; ton lots and over, 31c, Pittsburg.

URANIUM.—Oxide, ₱ ℔., $3.50.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific Coast inventors:

FOR THE WEEK ENDING NOVEMBER 10, 1903.

743,413.—ORE SEPARATOR—J. W. E. Allen, S. F.
743,673.—BENCH STOP—H. W. Baltz, Wyandotte, Cal.
743,807.—TOOL BOX—J. Begg, Ventura, Cal.
743,681.—SECTIONAL CAM—A. P. J. Bossell, Angels Camp, Cal.
743,817.—DENTAL BRIDGEWORK—F. A. Brewer Sr. & Jr., Watsonville, Cal.
743,821.—BOTTLE WASHER—W. E. Brown, Los Angeles, Cal.
743,690.—SAFETY PIN—Casper & Gerder, Sacramento, Cal.
743,973.—BALING PRESS—Coad & Biddle, Dallas, Or.
743,976.—OIL BURNER—L. E. Coleman, Santa Ana, Cal.
743,666.—ATOMIZER—A. S. Dixon, Los Angeles, Cal.
743,667.—ATOMIZER—A. S. Dixon, Los Angeles, Cal.
743,698.—CULTIVATOR—H. Downer, Grant's Pass, Or.
743,840.—SNATCH BLOCK—F. M. Eby, Cottage Grove, Or.
743,848.—BAG HOLDER—J. W. Fiddes, Tacoma, Wash.
743,979.—HYDRAULIC ELEVATOR—B. Flood, Los Angeles, Cal.
743,705.—PISTON AND PACKING—C. P. Fogh, Wadsworth, Nev.
743,490.—COMPASSES—J. W. Griffith, S. F.
743,981.—LAND MARKER—J. E. Hagen, Santa Monica, Cal.
743,864.—LOCOMOTIVE PILOT—E. R. Halesworth, San Bernardino, Cal.
743,639.—DRILL—L. A. Hardison, Santa Paula, Cal.
743,735.—CAN OPENER—H. B. Landis, Trail, B. C.
743,535.—CULTIVATOR—J. H. Martin, Riverside, Cal.
743,905.—ROOFING TILE—A. H. Memmler, Los Angeles, Cal.
743,742.—FISH CUTTING MACHINE—W. Munn, S. F.
743,916.—AIR BRAKE—H. F. Ong, Wendling, Or.
743,751.—DREDGER—R. A. Perry, Oakland, Cal.
743,752.—SEPARATOR—W. G. Read, Davisville, Cal.
743,940.—OIL BURNER—H. L. Sherwood, Oakland, Cal.
743,769.—HEATER—Tabrett & Lewin, S. F.
743,744.—WINDLASS—J. O. Toole, Butler, Nev.
743,777.—OIL BURNER—Tucker & Grundell, S. F.
743,596.—MECHANICAL MOVEMENT—L. R. Tulloch, Angels Camp, Cal.
743,783.—RAIL JOINT—R. J. Weken, Everett, Wash.
743,965.—SNATCH BLOCK—D. E. Welsh, Cottage Grove, Or.
743,787.—VALVE—G. G. Wickson, S. F.
743,609.—PAPER HOLDER—C. O. Young, Rialto, Cal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SECTIONAL CAMS FOR ORE STAMPS.—No. 743,681. Nov. 10, 1903. A. P. J. Bossell, Angels Camp, Cal. This invention relates to improvements in cams for lifting stamps in quartz and like mills. Its object is to provide a cam which can be quickly put on and taken off of a shaft without disturbing the other cams on the shaft or without the necessity of dismantling nearly the entire battery, as is so often the case in mills where the ordinary solid one-piece cams are used; also to provide a simple means of securely locking the cam on the shaft without weakening any of the parts.

SEPARATORS.—No, 743,752. Nov. 10, 1903. W. G. Read, Davisville, Cal. The object of this invention is to separate valuable and worthless products and to produce such separation without the use of screens or an air blast. It may be used to separate nuts or the pits of nuts from the shells or debris which may be mixed therewith, grain and chaff, mining products, and any material which may be separated in a similar manner. It consists of surfaces inclined and grooved in the direction of the length and made convex or declining from an apex to the edges transversely of the length, means for feeding the material to be separated upon the central line of grooves, means for imparting a shaking motion to a plurality of these surfaces over which the material is designed to pass, and means for conveying away the separated products.

DREDGER.—No. 743,751. Nov. 10, 1903. R. A. Perry, Oakland, Cal. This invention relates to an apparatus for dredging material from beneath the water or under conditions in which material can be elevated and transported. It consists in a means for advancing and fixing the apparatus at intervals so that the excavating device can be made to work over a certain stated space, and a mechanism for raising the advancing spud and transferring it from the rear to the front of the channel in which it operates. In conjunction with this an independent working spud may be employed about which the dredge is turnable while at work.

CAN OPENER.—No. 743,735. Nov. 10, 1903. H. B. Landis, Trail, Canada. This invention consists of a bracket or standard with means for permanently attaching to a table, a plate connected therewith having holding pins adapted to enter the top of a can, a ratchet bar slidable through guides in the upper part of the standard having a point adapted to enter the can centrally between the holding pins, a pawl adapted to engage the teeth in the ratchet bar to hold it and the plate in the proper relation with the cans of different heights and a handle bar swiveled to turn about the lower part of the ratchet bar, said handle bar carrying a knife adjustable upon it, so as to cut out the section of the top of the can by turning the handle around its fixed center.

PISTON ROD PACKING.—No. 743,705. Nov. 10, 1903. C. P. Fogh, Wadsworth, Nev. This invention relates to an improved metallic packing for piston rods and the like. Its object is to provide a simple, durable self-adjusting packing by which a tight joint can always be maintained. The special feature is that of the ball joint at each end of the packing ring; two inclosing cups with conical inner bearing surfaces corresponding to the tapers of the ring exerting a pressure on the packing more nearly at right angles to the axis of the piston rod to hold the packing tighter to the rod, and moreover the ring always has a full bearing on the rod.

SAFETY PIN.—No. 743,690. Nov. 10, 1903. J. W. Casper and Wm. Gerder, Sacramento, Cal. This invention relates to an attachment for safety pins which enables the user to easily disengage the pin from the inclosing tip into which it is forced by the elasticity of the parts. It consists in forming the enclosing tip into which the point of the safety pin is forced by elasticity with an open slot in the part against which the pin normally rests and in conjunction therewith of a hinged or pivoted plate, which is normally interposed to prevent the pin from passing out from said slot. By withdrawing the plate a little the slot is left open and the point of the pin will be forced through it and released.

SITUATIONS WANTED.

A COMPETENT MILLMAN OF 10 YEARS' EXperience would like to take charge of a mill in any part of the country, understanding cyaniding thoroughly. Wife would like to take charge of boarding house at same place. Address W. G., care of Mining and Scientific Press.

A YOUNG MAN, 5½ YEARS WITH PRESENT company, 3 years in charge of mill and placer works, graduate assayer, good millman, wants change of location where his ability to do things and performing them will lead to advancement. Can handle men successfully. Can leave in 30 or 60 days. Address "Mine Manager," this office.

AN ASSAYER AND CHEMIST WITH TWELVE years' experience in mining, milling, smelting and cyanide work desires a position. Best of references. Address Box 379, Ceutral City, Colo.

EXPERIENCED MILLMAN WISHES POSItion. Address Box 202, Enterprise, Cal.

MECHANICAL ENGINEER, TECHNICAL graduate, desires responsible position with gold dredging company. Ten years' experience as manager, constructing and consulting engineer gold dredges. Special experience saving fine gold. Can design and build complete plants. Will take position opening new ground or with going company. Address "Dredging," care of Mining and Scientific Press.

MINING ENGINEER AND METALLURGIST, with sixteen years of practical experience as superintendent, manager and consulting engineer of mines and mills, desires position on or after Janunry 1st. Speaks Spanish fluently. Address P. O. Box 77, Durango, Mex.

MINING ENGINEER OF GOOD STANDING, with twelvo years' experience in mines and mills, wants position as expert. School of Mines grnduate. Address V. X., this office.

POSITION WANTED BY NEW YORK ELECtrical engineer with Pacific Coast company. Experienced in construction work and selling. A position where he can work into the selling end preferred. References from company with which he is now connected. Address G. P., this office.

PRACTICAL EXPERIENCE IN METAL MINing, installing and operating steam boilers, engines and mining machinery, together with a thorough course in mining engineering at the Scranton schools, enables me to be thoroughly competent to take hold of a new property and develop it by the latest scientific mode of mining to a paying basis. Can furnish A1 reference. Open for engagement after January 1st, 1904. THEO. T. SWIFT, Muskegon, Mich. Lock Box 113.

SOBER YOUNG MAN DESIRES POSITION AS Mill Man. Has had six years' practical experience in amalgamating and concentrating, and a fair knowledge of the operation of engines. Will give best of references upon application. Address C. L. B., care this office.

SUPERINTENDENT, COMPETENT ASSAYER, Chemist and Surveyor. Special experience in development work; free or base ores; millman. Equipment complete. Address "Seattle," this office.

SUPERINTENDENT WANTS POSITION WITH substantial company. Practical miner, millman, assayer and cyanide expert. Address Supt., this office.

WANTED BY AN EXPERIENCED MINING Engineer and Manager, a position as mine manager in gold, silver or copper proposition, with a first-class corporation. Have had 35 years' experience in U. S. and Mexico; prefer Mexico. Speak Spanish, German, French and English. Am well acquainted with Mexico, and am employed now. Desire a change between November and January 1st, 1904. Salary expected not less than $5000 per annum. Can furnish the best of reference. Address "Mine Manager," care of Mining and Scientific Press, San Francisco, Cal.

WANTED—POSITION BY AN EXPERIENCED Analytical Chemist, Assayer and Millman. References furnished. Address H. T. S., this office.

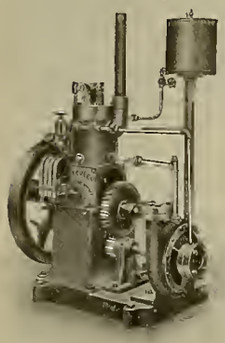
THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by hydraulic process from Omega Placer Mining Co., in Omega Placer Mine, near Washington, Nevada County, Cal., draining into Scotchman's Creek, which reaches Yuba River; from W. H. Murchie, in Murchie Mine, near Nevada City, Nevada County, Cal., draining into Deer Creek, which reaches Yuba River; and from W. I. Wadleigh, in Badger Mine and Liberty Hill Mine, near Dutch Flat, Nevada County, Cal., draining into Stump Canyon, which reaches Bear River, gives notice that a meeting will be held at Room 96 Flood Building, San Francisco, Cal., Dec. 7, 1903, at 1:30 P. M.



AIR LOCOMOTIVE.

Light Locomotives

INDUSTRIAL LOCOMOTIVE.

STEAM AND COMPRESSED AIR. COMPRESSED AIR FOR UNDERGROUND OR Hazardous Surface Haulage — Most Economical. Dependable, Safe and Satisfactory. Illustrated Catalogue on application if mine owner or official.
ADDRESS, MENTIONING THIS PAPER.
H. K. PORTER COMPANY, N. W. CORNER WOOD & SIXTH, **PITTSBURG, PA.**

A Self-Contained Cyanide Pump and Engine.

Capacity 75 to 150 Gallons per Minute.

YOU GET—
A first-class Gasoline Engine.
A 2-inch Centrifugal Pump.
A Heavy Iron Base for Engine and Pump.
Cut Driving Gears.
Fuel Tank and all connections.
Sparking Dynamo and Coils.
Oilers and Wrenches.

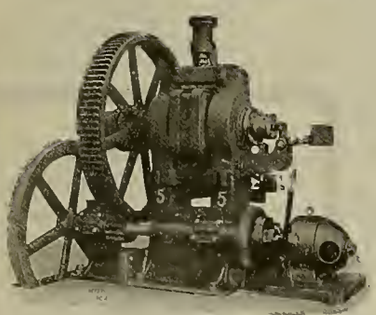
Attach Suction and Discharge Pipes—That's all.
Engine Automatic.

We build Stationary and Hoisting Engines up to 500 Horse Power.

HERCULES GAS ENGINE WORKS,
SAN FRANCISCO.

GENERAL ELECTRIC COMPANY'S

Electrical Mining Apparatus



Does away with long steam piping, and of leaking compressed air joints. It saves the miner from the high temperatures due to steam piping, it preserves the mine timbers through the absence of moisture, and costs far less for repairs and renewals than any other system of mine operation.

General Office: Schenectady, N. Y.

San Francisco Office: Claus Spreckels Bldg. Denver Office: Kittredge Building.
Salt Lake City Office: 25 East First South Street.
Los Angeles, Cal.: Douglas Building. Portland, Ore.: Worcester Building.

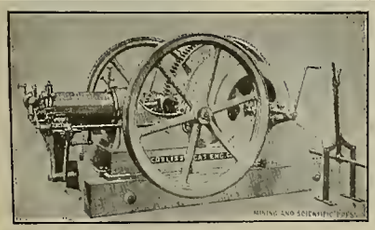
Crocker-Wheeler Company,

AMPERE, N. J.

Motors

for all sorts of industrial applications.

We carry a large stock in our San Francisco office, Fremont and Howard Sts.



HAND TRAVELING CRANES.

Any Length of Span.
Capacity to 40 Tons.
Bulletin No 5T on Request.

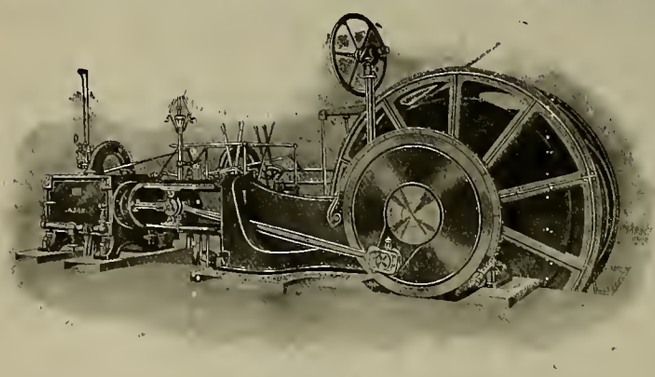
Main Office,
262 OREGON ST.,
MILWAUKEE, WIS.

PAWLING & HARNISCHFEGER.

MINING HOIST.

LATEST IMPROVED.

Operated with Gasoline, Distillate or Crude Oil direct, without Generator, making it the cheapest and most efficient hoisting outfit on the market. Built all sizes.



Also, Pumping and Irrigation Plants.

Write for information.

Corliss Gas Engine Co. Inc.

(Successors to ORIENTAL GAS ENGINE CO.)
223-225 FOLSOM ST., SAN FRANCISCO, CAL.

DIRECT-ACTING WINDING ENGINES OF THE LATEST AND MOST IMPROVED DESIGNS.

BUILT BY

WEBSTER, CAMP & LANE DIVISION,

THE WELLMAN-SEAVER-MORGAN COMPANY, 1400 New England Bldg., Cleveland, Ohio.

Improved Gold Dredge

DESIGNED AND MANUFACTURED BY

THE BUCYRUS COMPANY, SOUTH MILWAUKEE, WISCONSIN.

The Western Engineering & Construction Company,

PACIFIC COAST REPRESENTATIVES, 408-414 RIALTO BUILDING, SAN FRANCISCO, CAL.

THE MARION STEAM SHOVEL CO.,

No. 644 W. Center Street, MARION, OHIO, U. S. A.

Steam Shovels, Traction Dredges, Dipper and Clam-Shell Dredges,

Suitable for all kinds of **Excavating Work,** also **Digging Ditches, Leveeing, Canal Construction, etc.,** making a specialty of

PLACER MINING MACHINES,

separate or self-contained, either as a **dry land excavator** or **floating dredge.**

We make our own Steel and Grey Iron Castings also our own Chain.

GEO. W. BARNHART, Western Manager,
No. 4 Sutter St., SAN FRANCISCO, CAL.

Our Catalogue No. 1 describes **WATER WELL MACHINES** of many sizes, both traction and non-traction, for wells 50 to 1000 feet deep, and gives full illustrated instructions for operating.

Catalogue No. 2 describes **MINERAL PROSPECTING MACHINES** for exploring for Iron, Lead, Zinc, Coal and all minerals. Several sizes, both traction and non-traction. Also **PLACER GOLD TESTING MACHINES** for assaying Alluvial Deposits, Lake and River Beds to bedrock. Can be used on boat.

Also Sectionalized Machines and Boilers for easy transportation to difficult places. They make 6 and 8-inch holes through anything and bring to the surface everything found. Full instructions for operating.

Catalogue No. 3 describes **OIL WELL MACHINERY** for wells 1000 feet to 2500 feet deep. Several sizes, with full equipment and instructions for operating.

Our Machines are the sum of all excellence, in use all over the world. Top quality, bottom prices. Catalogues FREE.

WHO BUILDS THE BEST MINE PUMP?

PRESCOTT

FRED. M. PRESCOTT STEAM PUMP CO., MILWAUKEE, WIS.

MINING AND SCIENTIFIC PRESS.

Whole No. 2262.—VOLUME LXXXVII. Number 22. SAN FRANCISCO, CAL., SATURDAY, NOVEMBER 28, 1903. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents

The Mines of Santa Eulalia, Mexico.

The Santa Eulalia lead-silver mines are in the mining district of that name 17 miles southeast of Chihuahua. They were discovered in 1703, and have for many years been a great producer of lead and silver. It is said that during eighty-six years succeeding its discovery royalties were paid the crown on an output aggregating $112,000,000. The mines were worked by the primitive native methods until within the past twenty years. All the machinery in the district has been introduced within this time. The yearly tonnage is stated to exceed that of former times. It is connected with the main line of railroad by a narrow gauge road. The reduction works to which most of the ore is taken is situated about 3 miles from Chihuahua. The principal mines are operated by Americans. The country rock is largely limestone with dacite (a quartz bearing andesite). Underlying these is granite. The ores are principally carbonate of lead with galena at the center of the larger masses. Rich pockets of silver chloride, and occasionally embolite (chloro-bromide of silver), with some silver sulphide are found. The ore occurs as shoots and irregular masses in lunestone. The Santo Domingo mine (see illustration) is the most noted property in the district. The ore in this mine occurs as a replacement of limestone by the metasomatic process common in this kind of ore deposit. The limits of the ore deposits are not always sharply defined, sometimes passing by insensible degrees into non-metalliferous limestone.

THE American Mining Congress, the last session of which was held during September in the Black Hills of South Dakota, has caused to be introdueed in Congress a bill to establish mining experiment stations in each of the mining States and Territories of the United States, for the purpose of aiding in the development of the mineral industry, the bureau to be under the direetion of the Secretary of the Treasury. The bill provides for the appointment at each station of a geologist at a salary of $3000 per annum, and a chemist at $2000 per annum, and the sum of $5000 to be appropriated for the equipment of each station. It further provides that it shall be the duty of such geologist and ehemist to receive for assay or analysis all rock, cement, clay or other miueral-bearing substanee that may be brought to them by any citizen of the United States, and make a proper classification or assay of eaeh sample for the purpose of ascertaining the exact amount of gold, silver, cinnabar, etc., which eaeh sample eontains, and to furnish to each depositor of such sample, at nomiual charge, a full assay or analysis of samples, ete. While the idea of experiment stations is one worthy of eonsideration and may prove of decided benefit to the mining industry, thc plan outlined in the bill is clearly an invasion of the field now oecupied by the numerous assayers and ehemists throughout the eountry, and would result in driving some of them ont of their profession. A busiuess of the charaeter indieated in the bill would quiekly require the serviees of uumerous assayers under the nominal charge arrangement, for samples for assay and analysis would arirve by the thousands, and the geologist and ehemist would soon find themselves unable to meet the demand. The idea of solely qualitative analysis by State or government institutions has no objectionable features, but has much to recommend it, and if conduеted along those lines might aeeomplish much good for the mining industry.

Asiatic Labor for the Rand.

The report of the commissioner appointed by the Chamber of Mines of Johannesburg, South Afriea, to investigate the conditions under which Chinese labor might be employed on the Rand; the possibility of obtaining such labor and its adaptability as supplemeutary to Kaffir labor now employed there, has been made by H. R. Skinner, commissioner. In his report Mr. Skinner reviews the introduction of Chinese labor iuto the United States and the eauses whieh led to legislative action to limit Chinese immigration and ultimately to their exclusion. He states that when the Chinese first eame to America they were welcomed, as at that time there was a scareity of labor, and that they were found really useful in performing a great deal of work for whieh a sufficient number of American or other white laborers were unobtainable. But the Chinese eame in such numbers and entered so vigorously into competition with white labor that they beeame obnoxious and legislation to preveut their further immigration resulted. The commissioner reports essentially the same condition for Canada. He proposes a set of eouditions, suggested by experience of Amerieans, under which Chinese might be safely admitted to the Transvaal, as follows: "Term of serviee; elass of work he will be permitted to engage in; hours of labor; that he can under no circumstances or in any form engage in trade; that he cannot own land or vested property; compulsory return to China upon the expiration of his term of service, unless he eleets to apply for a renewal of his indenture."

The commissioner states that it is due to the nouability of the United States to enforce conditions of such a uature that lead to the opposition to Chiuese in Ameriea. The prineipal eounts agaiust the Chinese both in the United States and Canada are stated to be non-assimilation of the Chiuese to Western ideas and customs, the hoarding spirit of the Chinese; their preferenee to trade with their own people, and the successful eompetition of Chinese with white labor, due to the fact that Chinese are willing to work longer hours than white men, and the low standard of living among the Chinese, whieh permits them to live in comfort at a very low cost.

The eommissioner's report contaius much other interesting data, as the result of his inquiring into labor conditions as related to Chiuese on the Paeific eoast.

For several years past labor has been scaree on the Rand, the mines being unable to secure a full complement since before the Boer war. In their extremity they have looked to India and China and the interior of Africa, and even a species of enforced employment, akin to slavery, has been suggested, but the latter was rejected as impossible. India was found unable or unwilling to furnish the large number of men desired, and China has already earned a reputation for sending out a elass of labor which had ultimately beeome objeetionable. In view of this fact, the eommission was appointed which investigated with the above result.

If Chinese are ever employed on the Rand under the terms suggested by Mr. Skinner, it is difficult to see how they eau ever become a menace to South Africa commercially, socially or otherwise, for the Chinese beeomes merely a laborer without opportunity to exercise any personal preference, or being in any manner able to change his condition. His numbers may be limited. The length of his stay is predetermined. His occupation is fixed. He has no rights and no privileges, except to return to his native land at the termination of his term of service. In fact, he beeomes a mere machine, or is placed on the same plane as an animal. In South Africa these eonditions are possible to impose, but not so in Ameriea, where human beings are reeognized as sueh. If Chinese ean be iuduced to accept these terms and at the same time the rate of wages which will be offered, it may bc expeeted that any deficiency of labor in the mines of the Rand will be supplied by the Chinese empire.

THE dastardly assassination of the superintendent and foreman of the Vindieator mine at Independenee, Colo., on the 21st instant, is one of the most diabolical of sueh numerous crimes. That there is even a very small pereentage of union miners who would counteuance such a fiendish plot to avenge any real or fancied wrongs no fair minded person is willing to believe, but the commission of sueh crimes as the destruetion of the Bunker Hill & Sullivan mill at Wardner, Idaho, four years ago, and the assassination at that time of several men who were objectionable to the union; the cowardly murder of Manager Collins last winter, at the Smuggler Union mine near Telluride, Colo., and now this latest atrocity merit universal eondemnation. This is the latest of a list of crimes only somewhat less in degree that have been committed by men of this stamp, and those who elaim to control the miners' union should heartily try to make it impossible for such things to oecur. The name of the Western Federation of Miners is fast becoming a synonym for brutal assassination. Its watchword appears to be "Rule or Ruin." Two horrible crimes and a large number of lesser ones have already blackened the name of the State of Colorado, and it is time that the people of that commonwealth put an end to an organization capable of planning and executing such damnable murders as that at Independenee.

ONE of the notable features of the increasing output of the Cripple Creek, Colo., district is the leasing system. This method of working the mines of that district has always been prominent in the operation of that camp ; but it is stated that it is expeeted that a larger number of men will be employed under this system during the next few months than ever before. It is recognized as a most economical method of operating a mine. The leasers are not always individuals, but usually eousist of a number of men legally assoeiated as a eompany or eorporation, formed for this specific purpose. There are still large bloeks of undeveloped ground iu the district, mostly owned by the larger companies, aud on these blocks a great number of men will find employment. The leases arc based on a fair and equable basis, aud many leasers have made a fortune in this way.

THE improvement of oil and gas engines has done much to advance the development of the mining industry in the desert regions of the great Southwest. Many veins in these arid seetions have a high grade of ore, but these ores are not always easily treated. Electricity has not, as yet, been extensively applied in that part of the eountry, probably for the reason that the mines are seattered over a large area, often many miles apart, and although electricity is applicable to the operation of these mines, it is, generally speaking, impracticable at present from a commercial standpoint.

THE copper mines of Lake Superior are shipping out every available pound of copper from their storehouses in order to take advantage of the lower freight rates obtaining by the Great Lakes during the open season When the shores are frozen on the approaeh of winter the eopper output must be shipped by the all-rail route, at greater expense, hence the present activity in shipping out all metal on hand before the coming of winter.

EACH year sees steel entering more widely into mine construction work. A few years ago a steel head frame was looked upon by many as an experiment which might possess some unknown element of uncertainty and danger. The successful eonstruction and continued use of steel head frames, as well as of buildings, has made them not only popular, bnt their superiority is recognized.

DURING the summer Judge Sloan of Yavapai county, Arizona, issued a temporary injunction against the loeal members of the Western Federation of Miners, restraining them from interfering with the operation of the mines owned or eontrolled by the Mine Operators' Association of Yavapai county. This injunction on appeal has now been made permanent.

GOVERNOR WELLS of Utah has found it necessary to send troops to Castle Gate coal mines, where the striking coal miners have been using threats and intimidating miners who wished to eontinue work. These men had no particular grievanee, but struck out of sympathy with the Colorado miners who are on strike.

CONCENTRATES.

THE deepest oil well in California is reported to be 2846 feet in depth, the next deepest being 2810 feet.

✤✤✤✤

THE cam, in form similar to that in use in the stamp mill, was employed as early as 1550 to operate a multiple bellows in the manufacture of iron.

✤✤✤✤

BY geomorphology is meant the genitic study or tracing of the origin of the topographic forms of any age or region, through the combined processes of degradation, or erosion, and deposition.

✤✤✤✤

THE first silver sent from Mexico to Spain after the conquest of Cortez is reported to have been taken from the mines of Tasco, in the State of Guerrero, in 1552, in which year the ore deposits were discovered by the Spaniards.

✤✤✤✤

THE mineral powder from Delta, Colorado, is evidently the result of precipitation of iron from water containing it in solution, by sulphuretted hydrogen, and the oily appearance of the water is probably due to the sulphuretted hydrogen.

✤✤✤✤

THE relation of horse power to the number of revolutions of an engine, as adopted by the British Admiralty, ranges from 350 H. P., at 125 revolutions, through a greater power with a lesser number of revolutions, to 6000 H. P. at sixty-five revolutions.

✤✤✤✤

AT Lundy, in Mono county, Cal., the Crystal Lake M. Co. have the suggested method of plowing up a bed of tailings that are being cyanided. A quantity of hay is scattered over the tailings dump and a drove of forty hogs are turned loose to root for a living, which they do, loosening the compact sands and permitting them to dry.

✤✤✤✤

IN crosscutting through hard rock, where zones of soft, seamy rock are encountered, it is cheaper to timber this part of the crosscut at once, for later the soft ground is almost certain to cave unless supported. In the endeavor to economize, this precaution is sometimes neglected and a cave occurs, which increases the expense of timbering.

✤✤✤✤

THE workings of dry mines may be filled with dry tailings with safety, but such an expedient in a wet mine might prove both expensive and disastrous, as if any opportunity occurred the tailings would run like quicksands and give no end of trouble. At the Morenci and Shannon mines, near Clifton, Arizona, tailings are being dumped into the mines to fill old stopes.

✤✤✤✤

THERE are few mines where crosscutting is not advisable, if not necessary. Experience has taught that failure to crosscut has frequently resulted in a mine superintendent leaving the discovery of a rich shoot of ore to his successor, who did crosscut systematically. Occasionally a cave in mine workings will expose ore, the existence of which was unsuspected, but which would have been found by crosscutting.

✤✤✤✤

ANY desired design may be etched on polished steel by covering the metal with a coating of wax, first warming the steel. When cold, sketch in the wax the design or inscription, allowing the point of the instrument to penetrate entirely through the sheet of wax to the metal surface beneath. Then apply nitric acid and allow it to remain in contact with the steel for a short time, then wash the acid out with warm water and remove the wax with a cloth, and the design will be found etched on the surface of the metal.

✤✤✤✤

THERE is an established ratio between the size of wire rope and the sheaves over which it passes. A ½-inch rope should not be run on a sheave or drum less than 4 feet diameter; a ¾-inch rope should not be run on a smaller sheave than 5½ feet diameter; an inch rope on a 7-foot diameter sheave, and a rope 1½ inch diameter should not be run over a sheave or drum having less than 12 feet diameter. Winding ropes over sheaves or drums of smaller diameter than that suited to them, results in breaking of the wires and the unstranding of the rope, which makes renewal of the rope more frequent than would otherwise be necessary.

✤✤✤✤

THE peripheral speed of wheels of varying size keyed to the same shaft, if revolved, is proportional to their several diameters. If a straight track has three rails, the center one being 4 inches higher than the outside rails, and the outside wheels are 2 feet in diameter, the center wheel being 16 inches in diameter, with each rotation the 24-inch wheels will move forward 75.3984+ inches, and the peripheral movement of the 16-inch wheel during the same revolution is 50.2656+ inches; so that with each revolution of the axle the central wheel will be dragged forward 25.1328+ inches. Raising the central rail above the outer rails will make no difference.

✤✤✤✤

AUGITE is aluminous pyroxene. It frequently is found altered in part, or completely, to the variety of hornblende known as uralite. Augite is greenish to brownish black, to black. The uralite resulting from its alteration is grass green and usually fibrous. It is commonly observed in many igneous basic rocks such as diabase. The uralite by further alteration passes over to chlorite. Original hornblende also alters to chlorite. Chlorite schist may be the result of the alteration of either diabase or diorite. Chlorite schist is often siliceous and gold bearing, constituting large masses or zones of pay rock. It graduates into talc schist, argillaceous mica schist and slaty serpentino.

✤✤✤✤

SHAFT BOXES to carry a sheave on a vertical post gallows frame may be of the "bracket" type or may be flat. In either case the boxes should be let into the post at least 1 inch by cutting a dap in the faces of the upright timbers holding the shaft. The boxes may be secured with lag screws, or, if preferred, with bolts passing entirely through the posts; the latter is not necessary. The sheave may run freely on the shaft, or the shaft may be made to extend beyond the boxes and give free play, to equalize the direction of pull, if the hoisting reel be near the gallows frame. If the distance from the sheave to the reel be 60 feet the angle made by the rope crossing from one side to the other of the reel is unimportant in small hoisting plants.

✤✤✤✤

DRY CRUSHING and roasting of telluride ores, prior to cyaniding, is practiced at some of the mines of Western Australia. The telluride ores of the Black Hills are cyanided direct, being crushed wet. Recently at one mill in that State the practice of crushing ore in cyanide solution has been discontinued, for the reason that coarse free gold had appeared in the ore, and copper amalgamating plates have been placed below the batteries, the ore being cyanided after amalgamation. Little success has attended efforts to amalgamate ores where the cyanide solution is used in the battery, as the cyanide renders the plates hard and almost as brittle as glass, and, being rendered non-absorbent, they catch little gold. A little cyanide on the plates is beneficial; too much is worse than none at all.

✤✤✤✤

WHEN air is compressed in a cylinder in a single operation to 100 pounds pressure a high temperature results, and for this reason the cylinders of air compressors are jacketed and a current of cold water is kept in circulation through the space between the jacket and the cylinder. Sometimes this temperature exceeds 400° F., and under such conditions it is difficult to properly lubricate the interior of the cylinders. The oil fed into the cylinder is blown into the pipe line and eventually reaches the mine through the exhaust of the machine drills. Occasionally the oil, and organic substances taken into the compressor through the intake valves, catch fire from the high heat generated in the cylinder. This is known as "flaming of air compressors." The danger of this is diminished by compressing air in two stages, by compounding in two cylinders. This results in securing high pressure with much lower temperature.

✤✤✤✤

WULFENITE and vanadinite are rare lead ores, but are occasionally found in Arizona and New Mexico. Wulfenite is lead molybdate, containing molyhdenum trioxide 39.3% and load oxide 60.7%. Calcium sometimes replaces the lead. This mineral is found in square tabular crystals, sometimes massive, and either coarse or fine. Its hardness is 2.75 to 3, but it is very brittle. Color yellow, orange yellow, honey yellow, greenish, grayish white, sometimes bright red, streak white. Vanadinite is a vanadate of lead, and also contains chlorine; vanadium pentoxide 19.4, lead protoxide 78.7; chlorine 2.5, or lead vanadate 90.2 and lead chloride 9.8. Phosphorus is also often present, also sometimes arsenic, both replacing vanadium; in color resembles wulfenite. The attempt is to be made to work some of the Arizona mines containing these minerals to obtain the rare molyhdenum and vanadium contained in them. In former years large quantities of these minerals were sent to the lead smelters together with carbonate lead ores.

✤✤✤✤

TO DETERMINE the horse power of a steam engine, the following formula is employed: Indicated horse power (I. H. P.) $= \frac{PLan}{33,000}$, in which P means effective pressure in pounds per square inch; L is the length of stroke in feet; a the area of piston in square inches (for accuracy one-half of the sectional area of the piston rod must be subtracted if it pass through one head, or the whole area if it pass through both heads); n equals the number of strokes per minute (two for each revolution of the flywhool). Example: Cylinder 8 inches diameter, stroke 11 inches, working pressure 140 pounds per square inch, 200 revolutions per minute = 400 strokes per minute; 8 inches diameter = area 50.265 square inches; 11-inch stroke × 400 strokes = 366.6 feet; 140 × 50.265 × 366.6 = 78.1 H. P. For two cylinders this is 78.1 × 2 = 156.2 H. P. This is only approximate, no allowance being made for friction, condensation, or other causes of loss of power. There is often considerable difference between theoretical indicated horse power and actual horse power developed by an engine.

✤✤✤✤

IN drifting in running ground where "breast boards" are necessary, it is generally advisable to work from the top downward. The overhead lagging and those on the side nearest the top, should be driven as far forward as possible, extending beyond the ends of the side lagging and the face of the drift. The top board may then be taken out and a quantity of the loose ground removed, the board replaced and driven forward as far as possible. In succession each board is thus removed and replaced until the bottom is reached, when the operation is repeated, recommencing at the top. In ground not too bad to permit it, this process may be carried on from the bottom upward, the board next the bottom being first removed and enough ground taken out to permit it to be advanced several inches. The ground is then cut out from behind the second board from the bottom without removing it, the board being advanced by driving up the side lagging. In this manner the work proceeds from the bottom upward; but, as previously stated, if the ground be very bad, the work had better be commenced at the top, or a run may occur which would cause much loss of time in catching up.

✤✤✤✤

IT is impossible to figure the horse power of a boiler, having the superficial area of heating surface only. A boiler horse power was formerly determined by the amount of water evaporated per hour, in units of 34½ pounds, from 212° F. Two boilers of the same size and identical in make may be rated at 100 H. P. each. The one with good fuel and forced draught may develop 200 H. P.; the other, with poor fuel, inexperienced firing, poor draft, etc., may not develop 75 H. P. The American Society of Mechanical Engineers appointed committees in 1885 and 1899 to make tests of steam boiler capacity, and these committees reported as favoring what is known as the centennial standard, viz.: "The commercial horse power of a boiler shall be the evaporation of 30 pounds of water per hour from a feed water temperature of 100° F. into steam at 70 pounds gauge pressure, which shall be considered equivalent to 34½ units of evaporation. In order to derive the greatest amount of power from a boiler of any size, all the conditions under which it must operate should be at their best. This includes quality of fuel, arrangements for draught, proper firing, heated feed water, large relative heating surface. The heating surface per horse power is usually placed at 11.5 square feet, the grate surface per horse power at ⅓ square feet, ratio of heating to grate surface 34.5. The heating surface should be such that there should be at least 1 square foot for every 3 pounds of water to be evaporated at 212° F. per hour, and still more liberal allowance should be made if its efficiency is reduced in any way, as through incrustation, or by accumulation of soot, or through a tendency of the heated gases to select passages of least resistance and to blow through them at such high velocity that a great amount of its effect is lost. If the surfaces are clean and the heated gases pass over them uniformly, there is little to be gained by increasing the heating surface beyond 1 square foot to each 3 pounds of water evaporated per hour.

✤✤✤✤

POCKETS of gold occur under a great variety of conditions in mines. Often they are found in large and well-defined veins, frequently they occur in the walls of such veins, and again in seams. In nearly every instance where pockets of gold have been found, careful investigation has shown that the pockets occur in a vein or seam at a point where at least one other vein or seam, and often two others, intersect the main vein or seam. Cases have been noted where pockets occur along a line of fault which had dislocated a gold-bearing vein. In some pocket mines the bunches of gold occur with noticeable regularity within a well-defined zone or area along the fissure carrying them, forming what may be termed a shoot, beyond the limits of which pockets are not found. When a mine of this character has been extensively developed, a working map, showing the various cuttings with the stopes where pockets were found, has the same appearance as the stope map of a mine where the gold is evenly distributed and no pockets occur. Pockets of gold are also found in dikes or zones of slaty or schistose rocks, within well-defined walls. In such cases there is usually a series of transverse fissures, crossing from wall to wall—in the dikes due possibly to shrinkage, and in the slates to stretching of the rock. In these transverse fissures, which usually lie in a plane approaching the horizontal, is found crystallized quartz, calcite, iron sulphide and other minerals, with pockets of gold distributed along these "floors" of quartz. Usually in such fissures the gold is found near one of the walls. Where the zone is slate or schist, it is often found that there are seams or veins of quartz running with the slates or schists and approximately coinciding with them in strike and dip. Across this zone, cutting both slates or schists and the veins paralleling them, are a second series of flat, or nearly flat, seams usually containing quartz, and at the intersections of these pockets form, either along the line of intersection or "bunched" at the point of a crossing of a third seam, called the "gold seam." These gold seams usually contain a pulverulent, earthy mineral, which consists largely of black oxide of manganese and iron oxide. Quartz in veinlets and granules is also present. Miners follow the seam persistently in the expectation of cutting veins and crossings where gold may be expected to occur, and are not often disappointed when in a pocket region. The slates and schists in pocket mines are usually heavily impregnated with pyrite. In some mines arsenical pyrite is a good sign of the proximity of a pocket of gold, though far from an infallible index. In other mines, where a dike accompanies the pocket-bearing seams or veins, the appearance of light green scales of iron silicate with the softening of the dike rock is considered a good sign, as this condition is frequently observed when pockets are found in mines of this description.

The Ybarra Mines of Lower California.*

Written for the MINING AND SCIENTIFIC PRESS.

Lower California has been attributed to a southern contiuuation of the Sierra Nevada uplift; and the Gulf of California is likened to the Great Basin.† That the peninsula about the 28th parallel differs in structure from the coast is evident. About Guaymas, on the Mexican mainland, are evidences of much local volcanic action. On one island in the harbor, shalcs and conglomerates are cut up by dykes and mixed with lava flows, at the entrance to the harbor, cliffs 500 feet high are composed entirely of light-colored lava beds, showing flow lines that bend sharply up and down, and twist about remarkably; amygdaloidal in structure, full of gas holes from the smallest pumice to the large caves that form the refuge of flocks of birds; while north of the harbor, along the Sonora coast, faults aud non-conformities occur at short intervals. About Guaymas the evidences are for much local disturbance.

Directly opposite, however, along the coast of the peninsula, from Santa Rosalia northward, the structure appears massive and extensive. The hills in the rear appear as large bodies of igneous rock, in places coarse grained, granitic, showing few structural lines. From the gulf shore, to one-third the way up the hillsides there are long shelf-like beds of lava that can be traced for at least 100 miles along the coast, distinctly contrasted with the hills at whose feet they lie. These beds dip toward the gulf; and in the canyous it can be seen that the surface of the shore takes its form from the position of these occurring on the Mexican mainland, help to show that the peninsula and mainland are of separate origin.* The predominance of these tombstone-like forms, the silence and absence of animal life, the broken up surface, the hot shadeless sun, result in an impression on the observer far different from the deep shaded magnificence of the Sierras.

Economically, the dryness of the climate is likewise the most important feature. On the side of its benefits are deposits of salts of industrial value that depend on dryuess for their origin. There are large beds of pure salt (Na Cl) at San Domingo, on the Pacific coast; of gypsum near San Francisquito bay, on the Gulf coast; and of kaolin, for porcelain, farther south; none of which, however, have been worked. On the side of disadvantages, are the great cost of getting water for operations, and the nearly related cost of transporting supplies. At the Boleo copper mine, at Santa Rosalia, the water has to be piped 20 miles. At the Ybarra gold mine, at Calmalli, the supply is from a single well, which supplies a 20-stamp mill, and all the camp, and also Campo Alemano, 10 miles south, where it is brought on burros and sold for 25 cents (Mexican) a keg of about twenty gallons.

Mining at the Ybarra gold mine has been carried on intermittently since 1891, with a force of about 150 Mexicans. The headquarters are at the town of Calmalli (owned by the company), in about the middle of the peninsula, where the company receives its supplies from San Domingo, on the Pacific coast.

The ore deposit resembles those of the Mother Lode of California. The quartz occurs in a talc schist, in a zone of crushing parallel with the cleavage. This zone averages 4 feet wide, reaching occasionally 7 or 8. The quartz lies in it mixed with thin layers of the schist, sometimes showing a foot, or several feet, of clear quartz; at other places, perhaps close by, changing to ribbou rock. This mixture of quartz and schist runs $12 a ton; but the cost of working up to the present has made that a low-grade ore. The work has been carried on chiefly by taking out frequent kidneys running $30 to $50, which have supplied a 20-stamp mill. The chief mine (the Otilia) is dowu 600 feet.

A feature that was to be expected from the extensive weathering is a considerable surface enrichment. In a stretch of several miles, where the vein crops on the surface, "Gambozinos" have dug it out, finding it pay in panning. Frequent shallow trenches and ditches thus remain to show the rush to the camp in the early days.

Open Cut San Francisco Mine, Ybarra Mines, Lower California.

Vertical Shaft Otilia Mine, Ybarra Mines, Lower California.

beds, aud not from erosion. The beds weather back iu successive layers parallel with the shore, looking at first sight like river terraces, probably similar to the "recession of cliffs" described by Powell, in the region of the Colorado canyon.‡ The general appearance is strougly for coutinuity of structure north aud south in the line of the peninsula.

The surface appearance, or topography, across the peninsula at the 28th parallel, however, despite auy similarity of geological structure, does uot at all resemble the Sierras. Two things govern the topography of Lower Californuia and make it different from that to the north, namely, the lowuess of the uplift, and, more important, the dryness of the climate. The former results in one hill after another, with rounded top, all at about the same height, seldom over 5000 feet, in monotonous frequency. The latter results in making it a desert.

The traveler, crossing the peuinsula from San Francisquito bay west to Calmalli, finds at the start a road cleared through the cactus years ago by Spanish missionaries. He takes with him all the water he will use, aud buries several kegs in advance for his burros. The cleared road does not go far, however, and the most of the trail runs through the loose, hot sand of arroyos. These arroyos, beside the loose sand, are filled with huge boulders, that make poor footiug for the animals, and render the trail indistinct. On all sides, weatbered rock appears in place on a great scale, whole hillsides of mere boulders similar to those that have already falleu into the arroyos. Weathering has goue on at an exteusive rate, while, owing to the scarcity of water, erosion has not followed to remove the disintegrated matter, which remains mostly in place. Cacti find a hold here and there among the rocks, helping by their roots to break them up.

In the wider of these dry valleys, where there is more room, cacti thickly cover the sandy floor, and the trail winds iu and out among them, much as in the sagebrush of Nevada. Some of these cacti (notably the Cedreos) are of strange appearance, and, not

Recovery of Tin From Tin Scrap.

Interesting details relative to the recovery of tin from tin-scrap was recently published in the "Zeitschrift fur Elektrochemie." In Germany, several works have been built and operated for carrying out this procedure, the largest beiug that of Goldschmidt, at Essen, where 50 to 60 tons of tin scrap are reported to be treated per day. The difficulty of obtaining an adequate supply of raw material has hiudered the dcvelopmeut of other works. The processes used for recovering the tin are based upon the use of the scrap as anode material, in a bath containing sodium chorlide and hydrate, or in one containing hydrochloric acid. The advantage of the former is that less iron goes into solution, but against this there is the lower efficiency of the process and the more spongy nature of the deposit obtained at the cathode. The failure to produce directly metallic tin is one of the chief difficulties in the operatiou of both processes, for considerable losses occur in smelting and refining the spongy deposit obtained at the cathode. Under certain conditions metallic tin can be obtained in the electrolytic bath. aud Pfanhauser has stated his opinion that the avoidance of formation of sponge is simply a question of maintaining the concentration of the tin salt solution in the neighborhood of the cathode. This condition would appear to be difficult to attain in the works treating tin-scrap on an industrial scale, and the problem of producing metallic tin at the cathode is complicated further by the slow but gradual increase of impurities in the electrolyte. A new works for the treatment of tin-scrap has recently been built at Pfaffstatten, uear Vienna, and an electrolytic process for recovering tin from slags is also reported to be in operation at Tostedt, in Germany.

Tin in Alaska.

Written for the MINING AND SCIENTIFIC PRESS by ROBT. M. BELL.

There has been much talk of tin in Alaska for the last two or three years, and the reports of Alfred Brooks of the U. S. Geological Survey, who conducted a thorough reconnaissance of Seward peninsula in 1900, and of Arthur Collier, who followed him in the same field in 1901 and 1902, had prepared the country to expect some valuable discoveries of tin in that region. And that expectation, it now seems certain, is not to be disappointed. The discovery has been made, and although the development as yet covers but the work of a single season, enough has been done to demonstrate beyond a reasonable doubt that a very large and valuable deposit of tin stone has been discovered at last in United States territory.

Seward peninsula is a body of land—something over 20,000 square miles in area—which lies between Bering sea and the Arctic ocean, and is washed by Bering strait on the west. The name Seward peninsula is only found on the most recent maps, but its position has become identified in the public mind by the wonderful discoveries of placer gold at Nome four years ago.

Since 1899 placer gold has been found in nearly all the streams of that richly mineralized peninsula, and almost uniformly the placer miners in the west eud of the peniusula have been finding stream tin in greater or less quantities iu their rockers and sluice boxes after shoveling in the gold-bearing gravel. Alfred Brooks was the first to identify the heavy mineral which the miners had been picking out of their riffles and throwing away, as the tin ore, cassiterite ($Sn O_2$), which, when pure, carries 78% of metallic tin. In some streams there was a great deal of this, and as soon as Brooks discovered its real character a special bulletin was issued describing it and warning the miners of the region to be ou the lookout wherever they found placer tin rich in the streams, for ledges of ore in place in the near vicinity. But till this year no ledges were found, though as much as forty tons of placer tiu was collected in a few streams in one vicinity in a single season.

In July, 1903, a party of prospectors set out from the town of Teller on Port Clarence to cross overland to the north side of the peninsula. They followed up Lost river, which empties into Port Clarence, 20 miles west of Teller, and bad gone only 5 miles from the coast when thcy discovered and located a tin ledge, which at present promises to be the most important mineral discovery yet made iu Alaska. The ledge is described as a granitic dike 100 feet wide, cutting through the lower Silurian limestone (called in the Uuited States geological reports of the region the Port Clareuce limestone), which forms the surface of all that section of the peuinsula and attains a thickness of 2000 feet. The ledge has been stripped the whole width and is found to carry good values in tin throughout, while some of it is said to be rich. Tin has been found in North Carolina, South Dakota aud California, but uot yet developed in importan quantities, and the Government reports show that

no commercial tin was produced in this country in 1902.

This discovery promises to change the story soon, lying as it does close to the coast and cheap transportation by boat.

The character of the ore and the extent of the ledge are not uncertain, for they have been investigated by Arthur Collier, who announced the tiu discovery to be bona fide.

Chlorine Smelting.*

Discussion of paper by JAMES SWINBURNE.

In view of manifest interest in the paper of James Swinburne on "Chloriue Smelting With Electrolysis," read before the Faraday Society of London, which was published in full in the MINING AND SCIENTIFIC PRESS in the issues of August 8 and 15, 1903, the following diseussion of the paper by O. J. Steinhart is of equal interest:

PRESENT PROCESSES.—I think Mr. Swiuburne's remarks, classed under the heading of "Present Processes," have a good deal of truth in them, as some of the cumbersome methods, although the outcome of the experience of generations, in some cases still are rather crude. On the other hand, it must not be forgotten that it is not only the carbon which causes the trouble in obtaining pure metals, but also the presence of fractional pereentages of other foreign bodies and metals. Will Mr. Swinburne fare much better by his proposed plan of obtaining the various metals? I think he will find that some of the metals produced will have to undergo further treatment to render them fit for use iu the arts.

CHLORINE PROCESS.—With regard to the remarks made under the head of "Chlorine Processes," I do not quite see how Mr. Swinburne can altogether avoid desilverization of the rich bullion obtained. Anyhow, the lead would have to be cupelled to separate it from the silver, and the resultant litharge either sold as such, or reduced to metallic lead.

I am uot quite clear in what way Mr. Swinburne proposes the substitution. Does he contemplate, for instance, the substitution of lead by zinc from the suspended chlorides in water, or in the fused condition? I assume it to be the latter.

With regard to the elimiuatiou of iron and manganese, this, I think, judging from past experieuce I have had, will be rather a troublesome step in the operation, but by no means insurmountable, provided proper oxidation of these elements is provided for.

While dealing with this part of the process, it may be interesting to recall some recent experiments by Borchers on the subject:

"Zinciferous galena, and also the middlings resulting from the mechauical dressing of such ores, and which cannot be further dealt with by chemical or electro-magnetic methods, are among the products which the author proposes to treat by means of electrolytic chlorine in revolving drums at a temperature of 30–40° C. Chlorides of the metal present are formed, with the elimination of free sulphur. These chlorides are leached systematically by means of water, and after removing the free sulphur from the remaining sludge by fusion with steam under pressure, the residue consists of an easily smelted 40% zincy product, carrying most of the silver. The mixed solution of chlorides of zinc and lead are boiled down and completely dehydrated, and finally submitted to electrolysis without previous separation. The ziuc and lead thus obtained will separate into two layers if kept fused, analogous to the ordinary desilverization by means of ziuc (Parke's process). The electrolysis of the mixed chlorides is particularly advautageous, as ordinary iron vessels can be employed, which cannot be done in the case of $ZnCl_2$ only. The following are products obtained: Sulphur, chlorination residue of argentiferous ziuc blende, silver, lead and zinc."

You see that he confirms Messrs. Swinburne and Ashcroft in their reaction. The reaction seems to go equally as well in the "dry" as in the "wet."

I have myself, in conjunction with Mr. Vogel and others, for several years made extensive large scale experiments with the view of commercially electrolyzing $ZnCl_2$. I can only confirm, from my own experience, that given an anhydrous $ZnCl_2$ as free as possible from oxygen, there is uo difficulty in producing zinc and chloriue. The yields of chlorine we have, however, obtained in no case exceeded 95%, as compared with the zinc, even with the greatest care, and as the recovery of chlorine, so to speak, forms the stepping stone in Messrs. Swinburne and Ashcroft's process, this item, consisting of a loss of 5% of chlorine, must needs be a very serious item in the cyclic operations contemplated by the inventors. However, no doubt Messrs. Swinburne and Ashcroft have carefully gone into this matter and satisfied themselves on this point.

SMELTING LEAD-ZINC BLUESTONE.—I presume Mr. Swinburne meaus by bluestone the mixed lead-zinc sulphides, although I believe this term is generally applied to a similar class of ore originally found at Anglesea.

COST OF PROCESS, ETC. — As to the cost of the process, I think, on the whole, that Mr. Swinburne's prognostications as to the cost are correct, although some of the various items must, under the circumstances, be more or less guesswork.

For instance, in the estimate given for the 100,000 tons, £15,000 are allowed for loss of metals and chlorine. Now, roughly speaking, 30,000 tons of chlorine will pass to the process, and allowing a loss of about 3%, this would amount to nearly 1000 tons of chlorine. I do not know what it costs Messrs. Swinburne and Ashcroft to produce chlorine, but putting it at £6 to £8 per ton, this aloue would form a considerable item, not to count the absolutely unavoidable losses on, say, £700,000 of metals produced; £15,000 will certainly nothing like cover all this.

I should also like to know, with reference to this point, if Mr. Swinburne has satisfied himself that ores aud slimes can be obtained at the low rates he uentions, as some of us well remember how another promising process came to grief, owing to the want of rich enough ore at a reasonable figure.

With regard to the treatmeut of some of the other metals, such as antimouy, arsenic, nickel, etc., I think Mr. Swinburne has set himself a task which will take years to work out in its various branches.

Taking the paper and processes as a whole, I think great credit is due to the persevering and untiring work of Messrs. Swinburne aud Ashcroft, and it is only right that inventors who have left the beateu track of other metallurgists and chemists, and shown such originality in their new methods, should meet with every success.

R. S. Hutton said he would like to know whether the process could be applied to treat mixed nickel and copper sulphides. Nearly all the Sudbury nickel ores that were treated in America had to be desulphurized, and there was an enormous loss of sulphur. At the same time America imported large quantities of sulphur, much of which was roasted in order to yield sulphurous anhydride, e. g., for sulphuric acid and paper pulp manufacture. The application of such a process as Mr. Swinburne's should effect great economies in these directions. It should be particularly valuable in coujunction with Browne's method of nickel refining, by electrolysis of the chloride solutious, the preseut practice being to couvert the roasted ores into chlorides and thus lose all the sulphur.

Mr. Swinburne, in his reply, informed Dr. Steinhart that on account of there being a slight vacuum maintained throughout the system the loss of chlorine was very small; if there were leakage at any point, the tendency would be for air to leak in, not for chlorine to escape. In any case—and a certain loss of chlorine had always to be provided for—chlorine could be obtained quite cheap by the treatment of calcium chloride with zinc sulphate for example. Dr. Steiuhart's £6 a ton is for free chlorine; we would not buy free chlorine. The loss of metals was likewise practically negligible; the gangue left behind was always perfectly clean. There was indeed no point in the cycle of operations where such losses could occur. As regards the prices of the ores given in the paper these were based on estimates obtained from America, and were well within the right side of the margin. In fact they could be had at very much lower figures. Professor Thomson's suggestious to stop the process half way was, he thought, quite practical, and negotiations with a large alkali works were now being made to give effect to that idea. In reply to Dr. Perkins, the electrodes lasted if the zinc chlorides were perfectly anhydrous. There were two methods of effecting this—Dr. Steinhart's, and having recourse to a preliminary electrolysis with cheap carbons. The latter was the method employed in the present process. Answering Mr. Huttou, Mr. Swinburne said he had no experience with nickel ores, but they would doubtless behave in much the same way as the others. A question had been asked as to the purity of the metallic products; the metals obtained were perfectly pure, and needed no further treatment for refining. As regards the cost of water, which might be an important item in inaccessible districts, this was small. All the salts dealt with in the intermediate stages of the process were easily soluble.

*Trans. Faraday Society.

An Important Uplift Under the Great Plains.

In investigating the geological structure of the central great plains regiou, N. H. Darton of the United States Geological Survey has discovered an uplift, or arch, in the earth's crust, which may have great economic importance. Owing to the thick covering of clays and sands iu the plains, the structure of the underlying rocks is difficult to ascertain, but, from a careful survey of exposures in western Kansas, the Republican valley in Nebraska, and the southwestern corner of South Dakota, and a consideration of much new evidence afforded by well borings iu the last few years, Mr. Darton has demonstrated the existence of a narrow arch of considerable magnitude, extending from the vicinity of Lenora, Kans., through Norton county, across Furnace, Frontier, Lincoln aud other counties in Nebraska to the White river, where this river crosses the Nebraska-South Dakota State line.

This uplift is probably due to a slight shrinkage of the earth's crust, and an extensive series of cretaceous and underlying rocks are involved. As oil and gas are often associated with uplifts of this character, the one above uoted will undoubtedly attract the attention of those who are seeking for these products. Two deep wells, now in progress at Jennings and Kanona, Kans., lie slightly west of the line of uplift, so that they will not fully test its capabilities.

A report now in preparation on the geology of the great plains by Mr. Darton will be issued by the Geological Survey in the course of a few months, and describe more fully the geological structure aud resources in the region.

Measurement of High Temperature.

Demaud for a practical apparatus with which high temperature cau be measured is large, but, till lately, science could uot wholly meet this demand, measuremeut of high temperatures being limited to that degree which served as a standard in testiug, the nearest beiug the radiation of glowing bodies for the determination of their temperature. In February, 1900, a description of a new method for measuring high temperatures was published, based on a law first theoretically deducted and afterwards proven by experimeuts, showing how the same value for the temperatures for the electric arc light could be more easily obtained with the possibility of measuring up to 4000° C. and above.

On this subject H. Wauuer says: "The law established by all these experiments permits for at least a certain group of glowing bodies, measurement up to the highest temperatures. Wheu a compact body is heated, the rays emanating from same may be observed by the human eye; the body's color will chauge with the rising temperature from dark red to light red, to yellow aud to bright white, which colors—orange, yellow, etc.—are addcd until the rays meaus that at first mainly red rays are observed to which at the higher temperature the other spectrum appear white. In analyzing the rays by a prism it is found that with the rise of temperature some single color, for instance, red, suffers a rise iu the intensity which can be measured progressively with a specially constructed photometer. By knowing the law which combines mathematically the acting factors, the temperature, the proper light intensity of a single color, and its wave length make it possible to measure unlimited high temperatures by the photometric measurement of the light intensity of a certain color. * * * The entire procedure is so simple that it can be readily learned by any foreman or intelligent workman within a short time. The whole apparatus is 30 c. m. long (12 inches), built like a telescope, and can be easily handled without a support. It does not matter how great the distance is from which the measuremeuts are taken, if only the field of vision is properly illuminated by the light emanating from the body to be examined.

"The sources of errors with this new method rest solely with the exactness of the measurement, and by the quality of radiation as compared with the theoretically (so-called) 'black body.' As far as the first cause of error is concerned it can be ueglected, for various parties who have been asked to take measurements using this apparatus for the first time have obtained correspondiug correct results. The nearest to the theoretical black bodies are the insides of closed furnaces, as muffle furnaces, etc., the glow of which are observed through small openings, which, however, must not be covered by glass or mica during the measurement. The measured temperature is equal to within a few degrees of the real one.

"By actual experiments I obtaiued for blast furnace slag 1321° C., for outpouring irou 1384° C., for slag pouring from the converter 1700° C. The temperature of the converter gases seemed to remain below 1500° C. However, the radiation of the flame causes a rise of temperature as decarburation, etc., progresses; the falling of the temperature during scrap addition cau be measured progressively, while the absolute temperatures could not be obtained on account of the constant changeable transparency of the flame. The temperature of flowing steel can only be measured by looking direct upon the same.

"The advantages of this new apparatus, whose sole agents for the United States of America are Eimer & Amend, New York, consist in its reliability, because its indicatious are based on a law of nature determined scientifically correct, and not on an empirical one, accuracy, exceeding handiness (it may be used with or without support), portability, and its quick adjustment (consuming, according to experience, but a few seconds). The instrument may be adjusted at the start to any desired temperature, thus showing exactly when the same is reached. Another special advantage of the apparatus is that it can be trained upon any visible part of the furuace in order to compare the temperature in different places in the furnace. It is invaluable to iron and steel furnace men, in fact, to all, wherever high temperatures are to be measured."

Survey of Diamond Drill Bores.*

Written by W. R. BAWDEN.

The theory, so long stoutly defended, that it was impossible for a diamond drill to bore in auy other direction than a straight line, has long since been disproved, the clinostats invented by E. F. MacGeorge having been the most important factor in conclusively showing that serious deviations are possible iu the path of a hole bored by the medium of the diamond drill.

Although Mr. MacGeorge's instrument is well kuown, it is exceedingly difficult to procure and eveu more difficult to make, and after several fruitless efforts to do first the one and theu the other, the urgency of the situatiou rendered it necessary to look about for some other means of attaining the desired eud, viz., the survey of diamoud drill bore some 500 feet long having a supposed dip of 18½° from the horizoutal aud a diameter of $1\frac{3}{8}\frac{4}{4}$ of an inch.

It is uot necessary to detail the initial difficulties and somewhat heavy expenses entailed in designing a survey iustrumeut suitable for working in so confined a space as a diamoud drill bore, but suffice it to say that in no instance was it easy and in some cases impossible (without protracted delay for importation) to secnre suitable material as regards quality and dimeusions.

The difficulty iu procuring good workmauship in glass blowing aud also of securing true cyliuders of glass 6 inches loug by 1¼ inch in diameter is somewhat surprising, as also is the great loss due to breakages in cutting up loug glass tubes into short leugths.

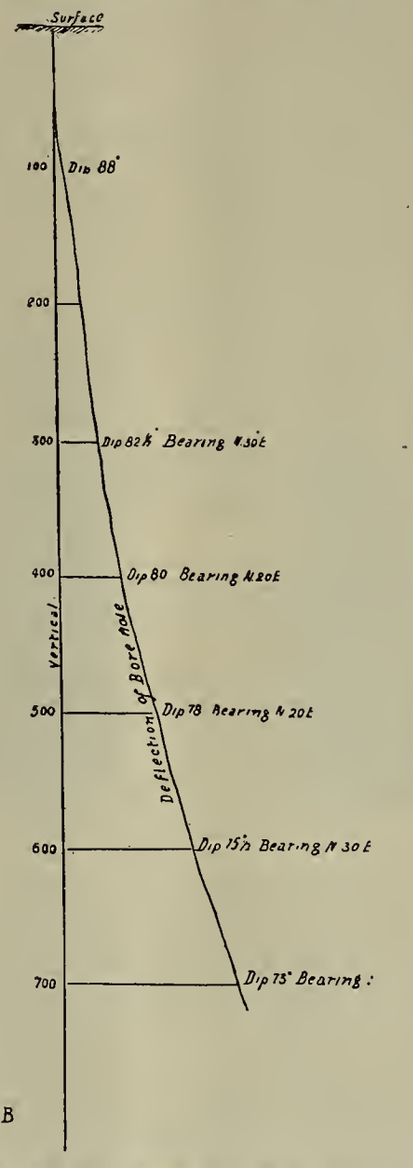
THE CLINOSTAT.—The clinostat with which the hole was eventually surveyed is more suitable for a horizontal hole than a perpendicular one, the degree of efficiency being decreased in proportion as it nears the perpendicular, bnt, by modifying, but still maintaining the main priuciple on which the clinostat is constructed, namely the Gimbal or universal joint motion, the instrumeut could be made as effective for the survey of a perpendicular as a horizontal hole.

The method of use of the clinostat is as follows:

The refraction meter is filled with liquid gelatine and allowed to cool, say at an angle of 15°.

The lines are then viewed through the solidified gelatiue and recorded by the reading instrument with the result that considerable refraction is observed.

When the meter is placed in the reading instrument, aud the graduation viewed through air, each of the degrees in the meter reads correctly with the degrees marked ou the vertical arc of the readiug instrument, but wheu they are viewed throngh the medium of gelatine or other more or less dense substance, the errors due to refraction are immediately apparent aud casily corrected. The difference at zero or horizontal positiou is very slight, but from that point the error increases as the angle of the refractiou meter is increased.



LOCAL DATA.—The diagram gives the course of a hole drilled on the Central Boulder gold mine, and showing the amount of deflectiou in a hole which was intended to be a perpendicular oue. The survey was made by a representative of Bewick, Moreing & Co. I uuderstand the dip and bearing were taken every 100 feet, and, as will be observed from the accompanying sketch, the deflection to the east commences near the surface, and continues irregularly but at an ever increasing rate down to a depth of 700 feet, where an obstruction was encountered rendering further survey impossible without having resort to special and expensive means for clearing the obstruction. The deviation at 700 feet amounted to 92 feet to the eastward.

This is a very serious difference, aud illustrates the uccessity of surveying before driving or sinking toward the point which the diamond drill was supposed to have reached, as it is quite within the rauge of possibilities that a deep hole with such a deflectiou might altogether pass out of the property in which it was started.

Information regarding the deflection of a perpendicular hole is supplied by G. M. Roberts, manager of the Associated Northern Blocks. The method employed in testiug the accuracy of the drilling operations was perhaps unique in itself, as it illustrated a case where, although the diamond drill bore swerved from its origiual course to a serious degree, the surveyor was enabled to tracc its course without the assistance of a diamond drill snrvey apparatus. The drill hole having beeu cut at one spot, a portion of the hole was exposed in order to make it possible to observe the augle of dip and direction by means of a theodolite. This gave data for striking the hole at a second place, where fresh observations had to be taken, as it was proved that the deviatiou continued to rapidly increase.

Thus from point to point the hole was traced and cut, until it had been interscctcd in no less than five places. The deflectiou in this instance was about 50 feet, and when it is considered that this deflection might have occurred toward any point of the compass, the problem that presents itself to a mine manager ou the completiou of a drilling operation is rather a puzzling one.

The results obtaiued from drilling operatious on the Great Boulder mine have, generally speakiug, beeu of a satisfactory nature, and by R. Hamilton I have been shown a number of instances iu which the far end of diamond drill bores, although deflected to a certain exteut, were easily picked up in driving and crosscutting. The majority of the drill holes drilled by the Great Boulder have been comparatively short, or have been more or less horizontal, rendering surveying practically unnecessary. Where it has been possible to prove the correctness of the drill holes by subsequent operations, it has beeu found that they have been fairly correct, but so far the opportunity has not occurred of proving! holes that were more thau 300 feet long, except in oue instance, where a level driven at the bottoun of a 600-foot hole proved a greater amouut of deflection than had hitherto been experieuced, the direction of the deflection (the total amount of which has not yet been ascertained) being opposite to that generally found ou the fields.

Bore Hole Central Boulder Mine, Western Australia.

At the Hannan's Star Gold Mines, Ltd., the difficulty in picking up the extremity of the diamoud drill hole which passed through a valuable lode, caused a good deal of anxiety and expense in exploring ground through which it was supposed the drill had passed.

A glance at the plan showing the supposed positiou of the bore hole, and the position given by the clinostat survey, will illustrate the importauce of either boring a hole straight or adopting some means of snrveying it.

The position of the lode cut by the diamond drill and plotted in accordance with the clinostat survey brings it in parallel with the lode where it had been explored in other parts of the mine, whereas the assumed or direct line theory throws the position altogether out of line.

The survey indicated the distance of the end of the bore hole from its supposed position to be about 150 feet iu a northerly direction, and that the deflection started from the collar of the hole. The initial error as regards azimuth may possibly have been due to a slight twisting of the machine when the necessary pressnre for drilling was put on. The hole, which started at about 18½° dip from the horizontal, gradually lost its depression and eventually became flatter until it attained a horizontal position, from which it rose about 1¼°.

CAUSES OF DEFLECTION.—The causes which go towards forcing the diamond drill rods ont of the course in which they are originally lined up are so numerous that one feels inclined to doubt if it is possible to drill a hole to a great distauce in a perfectly straight line. The force exerted at the top end of the rods acting against the resistauce at the bottom end would naturally bend the drill rods, causing them to bear hard on one side or other of the hole, thereby influencing and alteriug the angle of the crown.

The following notes, for which I am indebted to C. J. Winston, manager of the Goldfields Diamond Drilling Co., should be of much interest to those who have had experience of the vagaries of diamond drill holes on these fields, as he points out how faults may, to a great extent, be guarded against.

Mr. Winston, whose ideas are the result of long practical experience and close observation, writes as follows:

The causes of bore holes going out of trne courses are numerous. The principal are—

First—Soft formations and neglect to extend casiug.

Second—Boring a large hole and following core barrel with small rods.

Third—Giving the diamonds too much clearance beyond the metal size of bit.

Fourth—Working a wornout core barrel too long.

A word or two concerning each of these will help to explain why these causes affect a bore hole; also, in discnssing each case, past failures can be avoided, and means to ensure practical accuracy be pointed out clearly, so that every mine manager can see for himself where failures are liable to occur and can insist that proper precautions are taken before it is too late.

First Cause—In case of soft material being bored, if precautions are not taken in time the hole will enlarge by the action of the rod, and this will make the hole take an entirely new course. This is especially so if soft ground is eucountered between two hard faces of rock that stand at an angle to the direction of the bore hole.

As an illustration, take two walls 10 feet apart and having very soft ground between them. Wheu the diamond bit strikes the lower wall it is very certain to slide off and follow down the hard wall, and it is difficult to estimate where it eventually would go.

The remedy for this is to extend the casing until it rests on the lower wall. Then the bit has an iron tube to hold it straight and very little deflection will occur. The same tendency to slide off would be experienced with the casing as with the bit, but this is overcome to a great extent by having a loug string of casing that is a fairly close fit to the borc hole, and the hard upper wall will hold the casing straight and the loug length above the hard wall will guide the lower end through the soft part lying between the two walls.

The wider the hard walls are apart the longer line of casiug it is necessary to use to eusure the lower end not sliding down when it strikes the lower wall.

If this matter is properly attended to and intelligently handled, there need be little danger of any deflection of the bore from the true course when it euters the lower wall. If the holc be neglected at this point, error is certain to result—iu fact, rods have been known to break off at the point where the bore changed its course, aud they could never be picked up again and the hole had to be abandoned.

Second Cause: Having small rods following a large core barrel.

This is an error that has often caused holes to throw off their course by reason of allowing too much opportunity for the top end of core barrel to get too far below the center line of bit.

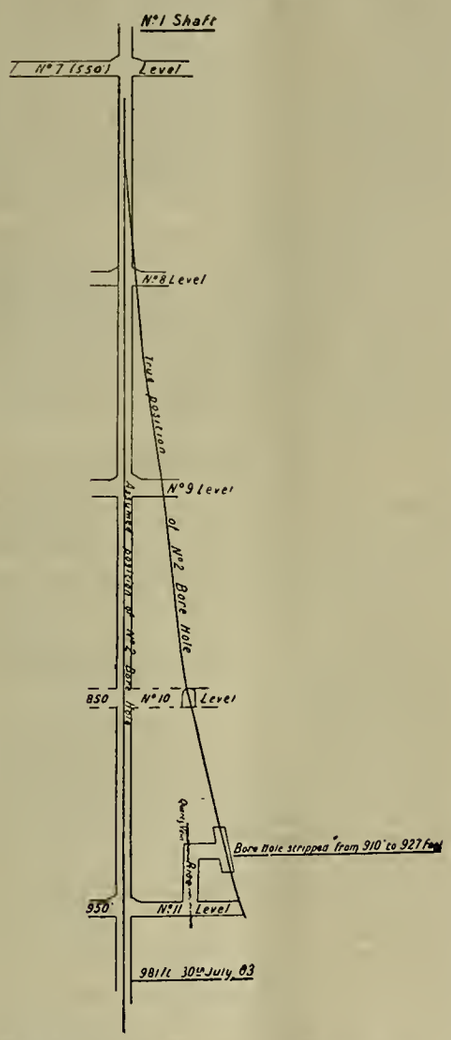
The remedy for this is to use rods as near the size of the hole as is practicable.

The proportions of drill rods to holes is to have the drill rods three-sixteenths of an inch less in diameter thau the hole, and the core barrel (which is 10 feet loug) only one-sixteenth of an inch smaller in diameter than the hole to be drilled. This gives bnt little chance for the hole to go off the true course, whereas with much larger difference between size of bore and core barrel and rods, the bore could not go straight, especially on angle holes, as the top end of core barrel would coustantly be out of ceuter and would throw the bit steadily up, and, once started, the tendency to creep up would gradually increase.

Since so many angle holes have been required dnring the last few years, this feature has been carefully noted, and practical drillers have found that old methods must be revised and the sizes between holes and rods be reduced considerably, otherwise the hole would gradually rise from the true course.

The investigations on the deflection of angle holes brought close study to vertical holes, with the effect of soou exploding the whole theory that, because a hole was started vertical, it would continue exactly vertical because the law of gravitation would ensure its doing so. We find that even in vertical holes the top end of the core barrel constantly lies to one side of the bore hole, aud we have practically the same defect as on angle holes, but with the difference that in vertical holes the core barrel will not necessarily

*Abstract Monthly Report Chamber of Mines, Western Australia August, 1903.



lie on one particular side of bore hole, but often changes from side to side, while in the case of angle holes it is constantly on the lower side, which throws the bottom end upwards. Vertical holes have often proved wavy, especially where large core barrels and small rods were used, the bore having gone off the true course and then thrown back again.

Another puzzling feature about all bore holes is that only one side of the top end of core barrel will wear. This is true of vertical as well as angle holes.

One remedy for this is to constautly change the rod immediately on top of core barrel; but, as this does not entirely remedy the wear, new rod couplings the exact size of core barrel are often used, being changed when the wear on core barrel becomes more than is deemed safe.

Third Cause: Setting diamonds with too great a clearance and cutting too large hole, and, in so doing, establishing the same defect as is experienced in using small rods in a large hole.

The writer has known drill men on the Rand in South Africa that made a practice of starting holes with as near a quarter of an inch clearance over

Bore Hole Associated Northern Mine, Western Australia.

metal size of bit as they could, and greatly reducing the size of each new bit as it was lowered to the bottom. This was with the idea that no reaming would be required when the diamonds in the previous bits lost their clearance, as the rock wore them down.

The correct way, and that which is practiced by up-to-date mill men, is to start the hole with as little clearance as possible and keep the same size the entire length of bore. This makes it necessary to ream new bits down from the point where previous bit began to loose its clearauce. This latter method is the better, as the hole is certain to go practically straight; but with excessive clearance it can not go straight.

Fourth Cause: Using a worn out core barrel too long.

This is another feature to be guarded against, as, when a core barrel is allowed to wear too thin at top end, the same results are obtained as by using small rods in a large hole.

This danger has proved to be great where holes have been tested, especially horizontal ones, and it was seen that when the core barrel was new the hole went straight, but, as it became worn, the hole began to strike an upward course.

The remedy for this is not to let the top end of barrel get worn very much before it is remedied by a new coupling, and before too late a new core barrel.

By a great deal of experiment it has been proved that horizontal holes can be bored straight, even where conditions of formation were all in favor of deflection.

On the Mount Lyell mine in Tasmania a bore was put out to strike a drive several hundred feet away and the data gained therefrom is of interest. This hole went true, as it not only struck the drive at the point expected, but a candle held at one end could be plainly seen at the other end.

This gave data for the proper clearance to give the diamond, and proved that the core barrel and rods used were of the proper proportions to give satisfactory results.

Another proof that they are the correct proportions is that in the Kalgoorlie field several tests have been made on angle holes. These tests were carried out on several different holes where soft ground was encountered below the casing where the ground was worn out by the action of the drill rods as the hole deepened and became much larger than the original hole. The operators plugged the holes below these soft places and poured and stamped cement into the holes until they were filled up, and after the cement had set it was bored out with diamonds, making core the whole distance, in fact, drilling a new hole through that part of the hole, and re-entering the old hole without any trouble whatever.

In several instances a length of over a hundred feet has been cemeuted in this way, and in each case the old hole struck without any trouble. This proves that holes can be bored straight if proper tools are used and careful and intelligent methods are employed, and it is also of equal importance that no neglect on the part of the meu, who should be especially trained for diamoud drill work, be allowed.

The most up-to-date machiues, tools aud methods are useless if carelessly used by unskilled and ignorant operators.

The practice of surveying bore holes with the methods lately introduced is valuable to both mine manager and drill operator; to the mine manager, it proves to his satisfaction whether the bore has been allowed to deflect, aud, if so, to what extent; and to the drill operator, it is valuable in helpiug him to perfect his methods. and indicating at what poiuts of wear he must make renewals. By frequeut exchanges of ideas aud experience betweeu mauagers, surveyors and drill operators, many points can be discussed and clearly demonstrated, and understood by all who are interested in the development and welfare of the mining industry.

Distribution of the Publications of the U. S. Geological Survey.

That people iu geueral do not take advautage of their opportunities is a truth as veuerable as society itself. A particular application of it is seen in the fact that many who would be benefited by a study of the publications of the United States Geological Survey do not apparently realize the privileges to which they are eutitled. The Government is at great expense to maintain scientific bureaus the chief ends of which are to increase the sum of humau knowledge aud to inform the people of the United States of the practical results of the investigations made. Every means is taken to give the public the widest possible benefit of the discoveries aud inventions of science. Large sums of money are annually expended in printing maps, folios, papers, bulletins, mouographs and scientific reports of one kind and another, the great majority of which are intended for geucral and gratuitous distribution.

Many of the publications of the Survey are of special iuterest to inhabitants of particular localities and should have a wide circulation in the areas they conceru. To further this end it seems advisable to call the attention of librarians throughout the country to a congressional act approved March 3, 1903, which provides that "the Director of the Geological Survey shall hereafter distribute to public libraries that have not already received them such copies of sale publications as may remain on hand at the expiration of five years after the date of delivery to the Survey document room, except a reserve which shall not exceed 200 copies."

This concerus only the sale publications of the Survey. The great number of pamphlets and reports intended for free distribution may be procured at any time by mere application to the Director of the U. S. Geological Survey, Washington, D. C. The sale publications are of three classes only—topographic maps, geologic folios and monographs.

The topographic maps are sold at the rate of 5 cents a sheet of staudard size. For 100 or more in one order, whether of the same sheet or of different sheets, the price is 2 cents a sheet for the standard size. Special maps and those of larger size are sold at proportionate rates and on the same conditions of discount. Prepayment is required and may be made by money order payable to the order of the Director of the U. S. Geological Survey, or in cash—the exact amount. Checks and postage stamps can not be accepted.

Geologic folios are usually 25 cents apiece, although ten of those issued have, on account of specially elaborate map work, sold for 50 cents. Only one—the geologic folio that treats of Yellowstone Park—sells for 75 cents. These folios should be of interest to miners, prospectors and land owners, and especially to teachers of geography or geology, and it is expected that there will be a growing demand for their use in schools.

Monographs range in price from 80 cents to $11, the average price being $2. The edition of one of the most elaborate—a $10 volume—has been exhausted. It was the work of Capt. C. E. Dutton and was entitled "The Tertiary History of the Grand Canyon of the Colorado." The subject naturally permitted great elaboratiou and great perfection of detail in the way of illustration, and these features brought up the price of the monograph.

Full circulars, descriptive of the publications and maps of the Geological Survey, can be obtained on application to the Director, at Washington, D. C.

Cyaniding Low Grade Slimes.*

Written by S. H. Pearce.

In a paper on work done in other fields of such importance and magnitude as that at the Homestake, one naturally makes comparisons with the work done on the Rand, especially as it is claimed that such work is on a higher plane than our own, and from that standpoiut this paper contains certain points that are worth consideration and discussion.

The first matter is that of finer crushing and larger plate area, where it is difficult to make a comparison; first, on account of the difference of weight of stamp, character of screen and height of discharge, and, secondly, by reasou of the very different class of ore under treatment. It is hard to believe that it would at present be commercially profitable to crush finer than the 1200 mesh used on some of the mines here (where 65% is obtained in the mill) on account of the loss in stamp duty, and the matter of quadrupliug our present plate area would be hardly justified in view of the fact that the bottom of our plates appear to be practically useless, and seem to show that further area is unnecessary. It is a fact, however, that it is quite usual to find amalgam in the launders below the traps and also in our spitzlutten concentrates, so that the matter is hardly finally settled, and observation on that point would be useful. The testimony of the effect of the temperature of the mill water is welcome in view of the difference of opinion here, and it might be noted that more water is used there than is our practice, which might perhaps account for the beneficial use of the extra plate area.

Mr. Merrill makes a great point of being able to produce, or rather, eliminate an unknown percentage of the pulp crushed as slimes unprofitable to treat. Any improved method of separating unleachable slimes from leachable sands is welcome indeed, but the method used there appears to uced more elevation of mill pulp in the first instance and produces results that do uot show any great improvement on those obtained here as regards the relative value of eliminated slimes to that of the leachable product. Those at the Homestake are given at $1.65 for sands and au average of 95 cents for slimes, or a ratio of 1 to 1.737, whereas the ratio on the Rand will be at least from 1 to 2 and up to 1 to 3, and this would either show that the old-fashioned German spitzkasten aud spitzlutten, as they are termed, are as good as Mr. Merrill's "coue system," or that he has an exceptionally difficult ore to treat by classification. It is probably fairer to suppose the latter is the case, as in the earlier stages of direct treatment on the Rand the spitzlutten were adopted which are now discarded for spitzkasten—the additional water being found to be unnecessary, as the further separatiou of the slimes is now effected in the filling tank. It is probable that our system of having a return spitzkasten for any overflow sauds as a safety valve is an important factor iu this matter of classification. In reference to Mr. Merrill's want of knowledge that slimes have been treated at a cost of less than that of those produced on the Homestake, viz., 95 cents, it might be pointed out that the average of the slimes costs for the Rand mines subsidiary companies for the first quarter of 1903 was 2s 8d, or 64 cents, and as the circumstances there are such that he is able to effect such a reductiou in cyauiding costs as those given, it is possible that even that grade might be a payable proposition, especially as the site there, being of a nature to allow of sluicing out treated sands, the slimes plant could be arrauged so that very little power would be necessary, gravitation being substituted.

Auother point which might be noted is the addition of lime, which it is stated that, if made to the mill direct, acts deleteriously to amalgamation, and also that it is advantageous to have the lime enter the vats in unslaked granules. This latter, in view of the wet crushing of the lime, would poiut to the character of the lime used as being of a very different nature to that obtained here. How can undissolved lime have any effect? CaO is an active agent in any lime. This might

* Journal Chemical, Metallurgical and Mining Society, S. A.

account for its different behavior in regard to amalgamation, although it might be noted that in more than one case upon starting up slimes plants here the mill plates have apparently deteriorated for a short period, and although this matter was not properly investigated at the time, it was probably due to accumulations in the mill water (through constant reusage for a long period), being precipitated out by the lime and causing the plates to appear coated, but that such was not detrimental to amalgamation was demonstrated by there being no appreciation of the value of the mill tailings whatever and the usual amount of amalgam being obtained. The use of lime in the mill undoubtedly has a tendency to harden the amalgam, and for that reason it is advisable to discard the use of "inside" plates, as any amalgam forming on them is soon scoured off, and in that "hard" condition is not so easily caught on the outside plates, and it is, perhaps, in this way that the Homestake mills fail to obtain equal results. Perhaps, indeed, the want of lime in the mill water (there being present only the small amount in the overflow of the cones coming back to the mill) might be another reason for so large a plate area being advisable.

In regard to the size of the lime granules having any effect upon the decomposition of cyanide we have no data here, but it seems hardly probable. The lime is usually passed through either the battery screen, or, where added subsequently in addition, is crushed to 900 or 1600 mesh. It has been noted, however, in several instances here, that even with this fine mesh, that where the lime is added to the pulp before separating out the sands there is a tendency for the undissolved particles of lime to remain in the sand treatment tanks, and with long contact with solutions are dissolved and increase the alkalinity of solutions to the detriment of precipitation.

The Butters & Mein type of distributor is in many cases discarded for the large vats in use here, but in the absence of return spitzkasten their use is justified.

The details of precipitation by zinc dust are very interesting, and it might be noted that the pumping of the full quantity of solution used through the filter press is overcome by a system of enrichment by successive use before precipitation. This is a system hardly to be recommended on these fields as likely to give more profitable results. Another point is that apparently large water washes are finally given to the charge as against our system of maintaining the treatment throughout with solution, and it would be interesting to know how the surplus solution so obtained is disposed of, and it is a pity that further details are not given, such as the method of sampling the charges, whereby such close results of actual and theoretical extractions are obtained.

The details given of the process of precipitation by means of zinc dust or fume are extremely interesting, being entirely new to the practice here, and although the system would have the drawback in our case of necessitating an enormous amount of pumping through filter presses, as well as the erection of further sump accommodation for precipitations, it appears a matter worthy of experiment, possessing, as it appears to do, the great advantage of a very high efficiency, and, further, what would appeal to many managers, a complete cleanup at any stated interval, nothing being left on zinc shavings, which constitutes a frequent source of disappointment by causing a temporary shortfall. The matter of pumping is not a very serious one, as it could be made to save the cost of excavation for sumps where solutions gravitate from the precipitation boxes, and would save the "lift" when pumping on to treatment tanks, which is a frequent source of annoyance by reason of losing the priming of the centrifugal pumps used. The matter of using solutions for a second leaching without precipitation is the principle adopted in our slimes treatment, and for the same purpose, i. e., of saving in the matter of box capacity, and, in view of a possible adoption of the fume precipitation, it could be carried out here to a certain extent, though hardly, I think, to the extent practiced on the Homestake.

It is interesting to note that lead furnaces are not used, but that the precipitates are slagged direct on the cupel after being treated with two acids, viz., hydrochloric and sulphuric. This acid treatment would be imperative in such a case, and one would almost think that the product would be sufficiently pure to melt direct. It is very probable, however, that the cost of such acid treatment would not be profitable here, where locally made H_2SO_4 costs 4d per pound and HCl over 1s; and, moreover, coal is cheap, so that it would appear that it would be better in our case to adopt the intermediate smelting in a lead furnace, especially as in either case it seems profitable to subsequently run the slags through a blast furnace. Our experience in this matter is, however, small, and the last word has yet to be said.

THE former plan of membership of 81 of the executive committee of the California Miners' Association was changed at last week's convention of that body to a more compact form of representation. The executive committee for the ensuing year consists of the following: J. H. Neff, W. C. Ralston, E. C. Voorhies, C. G. Yale, C. H. Dunton, H. Z. Osborne, J. Bermingham, Jr. The four elective officers of the Association, with the above, constitute the executive committee.

Method of Estimating Gold in Working Cyanide Solutions.*

Written by JAMES MOIR.

As is well known, the determination of gold in cyanide solutions by evaporation and fire assay, although possessing considerable accuracy, is an extremely cumbrous and lengthy process, especially when very weak solutions are dealt with. In consequence of this fact, control of the zinc precipitation of gold is rendered difficult, for the reason that the assay of the liquor from the foot of the zinc boxes is frequently not obtainable before the next day, by which time the solutions may have become seriously deranged, for example, gold-bearing solution may have been used for leaching.

Several processes have been introduced to ameliorate this condition of affairs; of these only the methods standing in the names of Mr. Crosse and of Professor Christy have met with technical success. These are precipitation processes and lessen the time required by eliminating the evaporation necessary; nevertheless, they still require a couple of hours to complete.

When my attention was first called to the necessity for a quick method of detecting traces of gold in the state of auro-cyanide I saw that not only the evaporation but also the fire assay must be cut out if the time required was to be materially reduced. The only alternative was a colorimetric method, and this we have ready to hand in the purple of Cassius test. This test, however, does not detect gold in presence of cyanide, probably because the auro-cyanogen iron has no tendency to dissociate into gold and cyanogen. The problem is just the same as that of detecting iron in potassium ferro-cyanide, which cannot be done by any direct test for iron. A second problem was that of making the purple of Cassius test sufficiently sensitive to detect one or two grains of gold per ton of solution. The test applied to gold trichloride fails to detect gold in a solution more dilute than one part in a million (14 grains per ton) and no other test is appreciably more sensitive. Finally, there were two more conditions which any such test must satisfy, viz.: (1) the free cyanide must be destroyed, or else the gold would redissolve; (2) all the impurities, such as zinc ferro-cyanide, must be kept in solution, else gold will be lost by being mechanically entangled in such flocculent precipitates. The latter condition was the stumbling block of my earlier efforts. I soon found that boiling the cyanide solution with aqua regia and precipitating the gold with zinc or aluminum satisfied all the other conditions, yet the zinc ferro-cyanide, which remained unaffected, retained the metallic gold so firmly that it was impossible to dissolve it in aqua regia, and, consequently, incorrect results were obtained with working solutions, although perfectly satisfactory results were obtainable with artificial auro-cyanide solutions. After some months of experimenting, during which I tried all ordinary reducing agents, and even such unusual ones as hydroxylamine, hydrazine and phosphorous acid, I gradually evolved the new process which I now recommend, and which takes less than twenty minutes to complete. The principle of this process is to precipitate the gold by means of the strongest available galvanic couple in a medium which destroys the cyanides and keeps the ferro-cyanides and other common impurities in solution. The metallic gold is then dissolved in aqua regia and tested for with stannous chloride in the usual way. The different intensities of color obtained are sufficiently distinct from one another to enable an estimation of the gold, within a few grains, to be made by comparison with a graduated color wedge or a set of standard colors, and after a little experience one can dispense with these and estimate within less than 0.2 dwt. by eye alone. The process is as follows:

100 c.c. of the cyanide solution is poured into an evaporating basin (of not more than 300 c.c. capacity), treated with one to two grams of sodium peroxide, and boiled for two minutes to destroy the cyanide. The quantity of peroxide and length of time of boiling is varied according to the amount of free cyanide present. Next, two drops of lead acetate solution (10%) are added, whereon a brown spot of PbO_2 forms and redissolves, showing whether enough Na_2O_2 has been employed. Next, the flame is removed and a small quantity (about 0.1 gram) of aluminum powder is added and the mixture vigorously stirred until hydrogen ceases to come off. If the aluminum is pure the liquid will not require to be heated. What happens is that metallic lead is first precipitated and the aluminum-lead couple electrolyzes the auro-cyanide, so that finally we have a black precipitate consisting of lead and gold, while the liquor no longer contains cyanide. The mixture is filtered through a small paper and the dish rinsed out into it. This is very easy with so alkaline a solution. The filtrate is rejected. Next 10 c.c. of aqua regia is warmed until it turns yellow and poured into the paper, and the filtrate is collected in a test-tube, boiled and poured through the paper again. This is repeated until the filter paper is perfectly clean, whereon it is washed out with a small quantity of water. The yellow filtrate is then treated with strong stannous chloride solution, added drop by drop until the yellow color has faded. If the original cyanide solution contained over .5 dwt. of gold the purplish blue shade appears at once, but if only a few grains of gold per ton were present the mixture must stand a few seconds. After half a minute the full intensity is attained and the comparison with the standards is made. For exact work the solution is poured into a cylinder exactly 1 inch in internal diameter and made up to a definite volume, say, 15 c.c. with water, before making this comparison. The purple solution fades through oxidation on keeping, and therefore, cannot be used for a standard. I, therefore, use a permanent imitation of the shade, made by adding copper sulphate solution to cobalt nitrate solution until the exact tint is obtained; the mixture is diluted for use and standardized by the results of the foregoing process applied to cyanide solutions of known gold-content.

For the range between .5 and 2 dwt. per ton the most convenient standard is an "indigo-prism" or triangular bottle, which, when filled with the above colored fluid, affords a gradually varying thickness of liquid, and can be graduated empirically once for all, so as to read directly in dwt. per ton. This is held horizontally and moved across the cylinder at the level of the gold-containing liquid until its color is matched, when the value is read off. Some practice in matching colors is required in order to read .1 dwt., but without practice one can read .2 dwt. Of course, it is more satisfactory to keep a set of standard tubes (15 c.c. in tubes of constant diameter) differing in value by, say, three grains, but this takes a longer time to prepare.

For quantities under ten grains per ton it is best to look down the tubes and make the comparison exactly as in "Nesslerizing." The lower limit is about two grains per ton, but if one starts with a larger quantity of the original cyanide solution than 100 c.c. the sensitiveness is proportionately increased, as the gold is still concentrated into the final 15 c.c. Thus, if 500 c.c. be taken, the limit is about 0.4 grain per ton (one part in 35,000,000). This should be easily sufficient to detect the gold in that low-grade proposition, the sea.

It should be noted that the differences of intensity are less marked for the darker solutions; anything over 3 dwt. per ton gives a nearly opaque solution. Therefore, if the solution to be tested is known to be strong, only 50 or even 25 c.c. should be taken for the experiment, diluting to 100 c.c. and multiplying the result by two or four respectively.

As a check against the occurrence of incomplete precipitation of the gold, it is advisable to test the filtrate from the lead with $FeSO_4$ and HCl for cyanide, which should be absent in a successful experiment. (Of course, if the original solution contains ferro-cyanides, the test is not applicable, except by comparison.)

The best mixture for the aqua regia is 100 c.c. conc. nitric acid, 300 c.c. conc. hydro-chloric acid and 400 c.c. water. This mixture keeps well and does not evolve chlorine until heated. Stannous chloride is best dissolved in dilute hydro-chloric acid; the trace of stannic salt usually present is advantageous, but the solution must be filtered until absolutely clear.

The best stout filter paper must be used, in order to resist the powerful re-agents used; the sheets are usually best.

The chemistry of the process is simple: The cyanide is hydrolyzed and oxidized to ammonia and carbon dioxide by the sodium peroxide—

$$KCN + Na_2O_2 + 2H_2O = Na_2CO_3 + NH_3 + KOH.$$

Part of the peroxide is decomposed into oxygen and caustic soda, which, with the aluminum-lead couple, gives nascent hydrogen, which reduces the auro-cyanide to gold.

$$Al + 6NaOH + 3KAuCy_2 = Al(ONa)_3 + 3KCN + 3NaCN + Au + 3H_2O.$$

The fate of the lead compounds is expressed in the following equations:

(1) $PbA_2 + Na_2O_4 = PbO_2 + 2NaA.$
(2) $PbO_2 + Na_2O_2 . Na_2PbO_3 + O.$
(3) $Na_2PbO_3 + 4H = Pb + 2NaOH + H_2O.$
(4) $Pb + Cl_2 = PbCl_2.$

For the benefit of those who can not at present obtain sodium peroxide, I have introduced a modification. A solution is made of 30% NaOH and .1% litharge; 10 c.c. of this is boiled with 100 c.c. of cyanide solution for five minutes, then the aluminum is added and the rest of the process is the same. In this case the cyanide is destroyed by nascent hydrogen and by hydrolysis, and rather more time is needed.

(1) $3KCN + 4Al + 9NaOH + 3H_2O = 3Al(ONa)_3 + 3CH_3NH_2 + Al(OK)_3.$
(2) $KCN + 2H_2O = NH_3 + HCO_2K.$

I have, in fact, succeeded in isolating methylamine from the products of this reaction.

Finally, I consider that the process is quite as accurate as a fire assay done on 100 c.c.; for the latter would be accurate only to three grains with a balance

*Journal Chemical, Metallurgical and Mining Society, S. A.

sensitive to $\frac{1}{10}$ mg., and, considering that the time required is so short, I am hopeful that the process will prove to be a real advance on previous work, and will conduce to fuller efficiency in our extraction processes.

California Gold Product.

The California State Mining Bureau has issued an elaborate table of California's gold product by years from 1848 to 1902, inclusive, from the compilations of various authorities during the years. The most complete and continuous is that furnished by C. G. Yale, statistician, and which is as follows:

Year.		Year.	
1848	$245,301	1876	15,610,723
1849	10,151,360	1877	10,501,268
1850	41,273,106	1878	18,839,141
1851	75,938,232	1879	19,620,654
1852	81,294,700	1880	20,030,761
1853	67,013,487	1881	19,223,155
1854	69,433,931	1882	17,146,416
1855	55,485,395	1883	24,310,873
1856	57,509,411	1884	13,600,000
1857	43,628,172	1885	12,661,044
1858	46,591,140	1886	14,716,506
1859	45,846,569	1887	13,588,614
1860	44,005,163	1888	12,750,000
1861	41,881,995	1889	11,312,013
1862	28,851,668	1890	12,309,793
1863	23,501,736	1891	12,728,869
1864	24,071,423	1892	12,571,900
1865	17,930,858	1893	12,422,811
1866	17,123,867	1894	13,923,281
1867	18,265,452	1895	15,334,317
1868	17,555,867	1896	17,181,562
1869	18,229,044	1897	15,871,401
1870	17,458,133	1898	15,906,478
1871	17,477,885	1899	15,336,031
1872	15,182,191	1900	15,863,355
1873	15,019,210	1901	16,989,044
1874	17,264,836	1902	16,910,320
1875	16,876,009		
		Totals	$1,379,275,408

Silver contained in gold has been parted and is not included in the tables.

This complete table to date is compiled from estimates of L. A. Garnett and the United States Mint Director's reports, these being considered by the compiler the most correct and complete of any extended continuous statements. The compiler, as statistician of the United States Mint at San Francisco, personally reported these figures to the Director of the Mint, from 1893 to date. Mr. Garnett's figures are for fiscal, and those of the Mint for calendar years. To account for the omission of the final six months of 1883 in Mr. Garnett's table, half of the total of that year's full figures of the Mint are added to his statement of the year, which will account for the apparently excessive product of 1883 as given. On consultation with Mr. Garnett, it was agreed that this was the only feasible method of reconciling the difference of fiscal and calendar years, in combining the two tables.

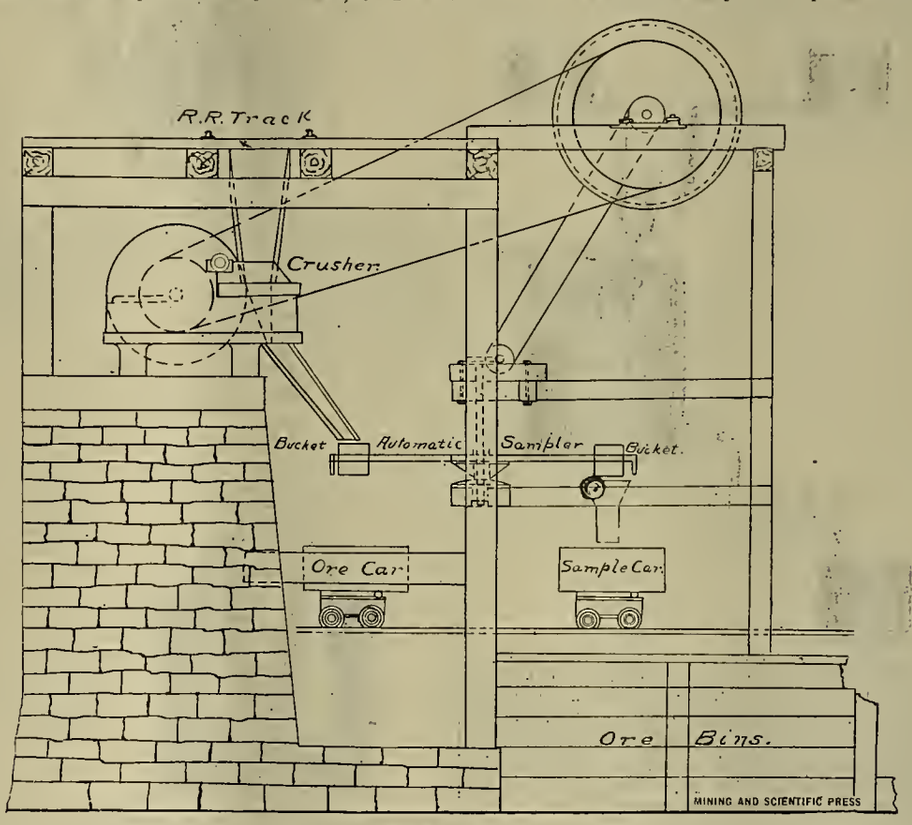
Sampling Custom Ores.

To the Editor:—On the subject of "Sampling of Custom Ores," I will briefly give my experience and methods of sampling herewith; and a sketch of an automatic sampler designed by the author and manufactured by the Colorado Iron Works Co., Denver, Colorado.

In many custom samplers, whether independent or in connection with a smelter, it is best to have every department simple and with as little mystery as possible so that the shipper will have his ore in plain sight all through—from the time it is weighed until he receives a portion of the pulp sealed with the sample works' seal. I have heard of cases where shippers also put their seal on the umpire sample before it is set aside. In this way he can make a perfect check on the assays of the purchaser and, if he is not satisfied with the methods of sampling, make his complaint before the sample is completed. Strange as it may seem, it is very seldom that a shipper will find fault in any way, but usually praises the method of sampling until he gets his returns, and then if they fall short of his expectations, he often complains. This cannot be said of regular and experienced shippers; and the same methods of sampling are always followed for every shipper.

We follow here the same methods of hand sampling usually adopted by the smelters in Colorado, as follows:

First, crush the ore to reduce the lumps all below a certain size; then take out every third, fifth or tenth shovelful for a sample as the ore is wheeled away to the storage bins. The proportion taken for sample depends either upon the size of the lot to be sampled or the richness of the ore. (In fact, the entire bulk of small lots of rich ore is often treated as a sample.) Every third shovelful of this sample is then taken and passed through a set of rolls; the rolls are then set up much closer, and half of the sample—by taking out every alternate shovelful—passes through the rolls again. This reduced sample is now taken to the sample room. This sample room is enclosed with a row of windows on three sides for light, and enables the shipper to watch the work. The floor where the sampling is done is covered with steel plates. The sample as brought from the rolls is deposited in two piles, then coned into one cone and carefully flattened out and cut into four quarters, two quarters being taken or sample and two quarters being rejected—care being taken to "alteruate"; that is, if the first two quarters taken up in the wheelbarrow are rejected and the remaining two quarters are reconed for sample, the next time the sample is coned and quartered the reverse is done by recoining the first two quarters lifted and rejecting the remaining two quarters on the plate. This is done in order to avoid any chance to favor either the shipper or purchaser.



After the sample is reduced in weight to about 15 or 20 pounds, it is put through an ordinary sample grinder, which reduces it to a fine powder. From the grinder it is taken in covered buckets to the assay office where the assistant assayer thoroughly mixes it by continuing the operation of coning and quartering until sample is reduced in quantity to about 40 ounces. This 40 ounces is then passed through a 100 or 120-mesh sieve by grinding the pulp which is too coarse on a smooth, cast-iron bucking board with a heavy muller. (Should any scales of native gold or silver be caught in the sieve it is cupelled with a little lead, weighed, the pulp from which it was sieved also weighed, the percentage value calculated, and added to the assay). After the pulp is all through the sieve it is again thoroughly mixed and put into three different sample sacks—one to be assayed at the works; one to be sealed and set aside for umpire, in case an umpire should be called for; and one to be sealed and handed to the shipper, if present, or if not, the sample is mailed to him.

Settlements are made as soon as the assays are compared between the shipper and smelter, or else the settlements are forwarded on the smelter's assays and corrections made afterward if the shipper finds any material difference between his assays on the smelter's pulp and the assays of the smelter. Should the assays not agree a reassay is called for by both parties. If these repeated assays do not satisfactorily agree, then an umpire is called into requisition and sent to some reputable assayer mutually agreed upon between the shipper and purchaser, whose results are to be final.

The same methods as above described are followed in the sampling of concentrates, excepting that no crushing or rolliug are necessary.

In some sampling works and some smelters samples are first taken out by hand shoveling, then rolled and completed with automatic samplers. If the ore is very rich and spotted, such as the ores of Cripple Creek, Colorado, it is all rolled and the entire sampling done automatically.

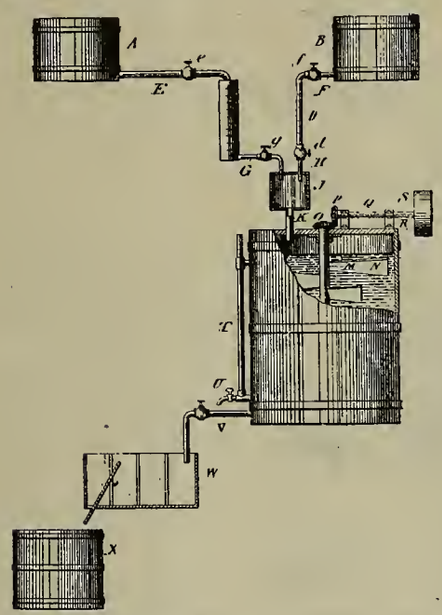
To the owners of mills where they mill uone but their own ore and stockholders in general, the importance of expensive hand sampling for accuracy does not appeal; but to the metallurgist who is not only often interested and has to account to the stockholders for the difference between metals purchased and sold it does, especially when running a custom plant; and while considerable saving can be made by the usual methods of automatic sampling, much more may be lost by salting the samples of large lots with dust from small rich lots, at the same time not giving satisfaction to the shipper of either the low or high-grade ores, on accouut of the ore being at times lost to his view—the idea being entertained by them generally that the dust iu the machinery will depreciate the value of their ore, when a very little calculation would prove how unreasouable their fears are. If 291.7 ounces gold per ton only equal 1%, it would only require oue-tenth of 1% gold dust to salt a sample up to 29.1 ounces gold equal to $582 per ton; and for this reason a very little rich dust from the automatic sampling machinery carried over from one lot to another is very dangerous. To prove this we have often had lime rock, which has been used to clean the rolls and crusher only once after a rich sample, assayed and found it to contain anywhere from a trace to $2 per ton in gold when the original lime rock contained no gold; and even after taking all reasonable precautions to clean the machinery, some dust still remains to work out later. While it takes so little rich dust to increase the values of precious metals of a small sample representing a large lot of ore, for the same reason it would be impractical to reduce the values perceptibly by adding foreign material to the ore without being detected ou accouut of the bulk, color, etc. In addition to the danger of salting by accumulated dust or soft rich ore sticking to the machinery, there is also dauger of taking out an uneven sample (unless the ore is very fine) caused by the larger pieces of ore striking together at the entrance of the slot cup, or whatever it is, of the automatic sampler, and rebounding but allowing the fine ore to pass on to its proper place. This continued loss of coarser ore (the coarser the greater the discrepaney) causes quite a variatiou iu the sample by the time it is completed. After describing my objections to automatic samplers, I freely admit that hand sampling is expensive and you have to depend upon the laborers beiug careful about taking their sample shovelsful from exactly the same place they take the rejected portion; and for this reason I propose a compromise by taking out the first sample automatically and then completiug the sample by haud labor where there is only a small portion to deal with. To do this and take samples of both coars and fine ore as it comes from the crusher in plain sight economically and with as little danger of salting as there would be with shovel sampling, I have outlined the following system, which we inteud to follow:

Arrangement of Sampling Works.

The ore, as it is received by carload after being weighed, can be dumped or shoveled into a hopper, couveying it to a 10x20 Blake crusher; from the crusher it drops into an ordinary ore car by which it is conveyed over the ore bins or mixtures ready for smelting; between this ore car or chute from the crusher passes the buckets of the sampler, so arranged as to time, size and nuinber that an average sample of the coarse and fine is taken anywhere from one-tweutieth to one-fifth as desired. The buckets are large enough so that in passing under the stream of ore they catch it all, passing on around in a circle until arriving over the sample car where they are tripped completely over and discharge their contents, again righting themselves ready for another sample. The buckets are made of steel, one piece forming the bottom and sides so as to prevent joints for the ore to hang in and be easily cleaned. These buckets are hung on the ends of arms projecting from a revolving disc; either the buckets or the arms can be removed with little trouble. This arrangement is simple and strong in construction; can be in open view, so that anyone can watch it, and requires but little room between the crusher and the car. Such a sampler would be suitable for taking samples from headings between the crusher and the stamps in mills, as it would require but little care and could be depended upon to take the sample just as often as the mill men desired. But the greatest advantage this sampler

has over others is the sampling of very coarse ore after the first crushing, for which it was originally intended, as all smelter men appreciate the objectionable features of fine ore in the blast furnace, as well as the extra expense required to make it fine; and most of the automatic samplers are designed and only suitable for taking accurate samples out of finely crushed ore.

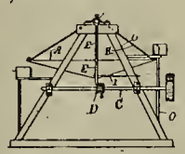
The accompanying sketch shows a narrow-gauge railroad track where they use bottom dump cars, and it is their intention not to use a shovel for handling the ore after it arrives at the smelter except to finish the sampling of the small sample and when the ore is smelted. Simple as this automatic sampler appears to be, a patent has been secured for it.



Val Verde, Ariz. SIDNEY E. BRETHERTON.

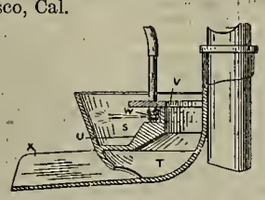
Mining and Metallurgical Patents.

PATENTS ISSUED NOVEMBER 17, 1903.



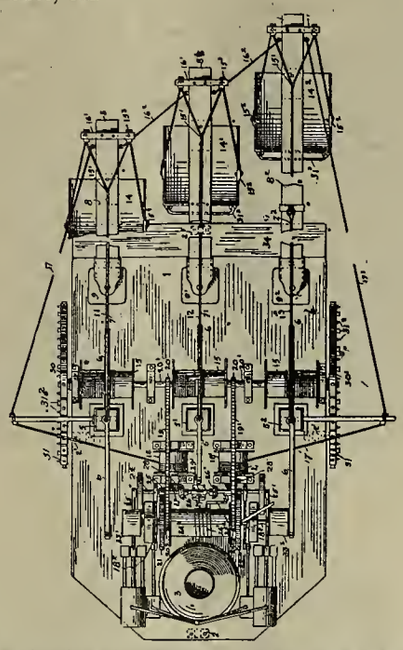
Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

APPARATUS FOR EXTRACTING PRECIOUS METALS FROM CYANIDE SOLUTIONS.—No. 743,551; J. A. Ogden, Deadwood, S. D.



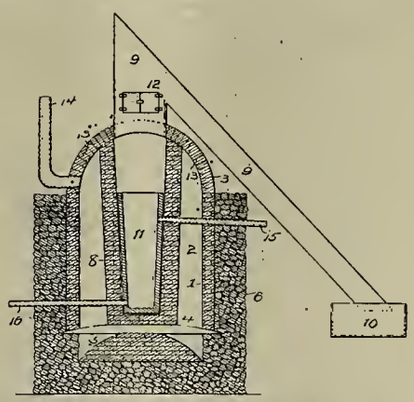
Apparatus for purpose of extracting precious metals from ores, consisting of primary and secondary solution tanks, each provided with discharge pipes with controlling cocks, and measuring glasses, mixing vessel adapted to receive the flow from measuring glasses, barrel with rotatable blades therein, and having glass gauge on outer face thereof, and settling tank adapted to receive discharge from barrel.

CONCENTRATOR FOR FINE ORES.—No. 744,021; F. L. Bartlett, Denver, Colo.



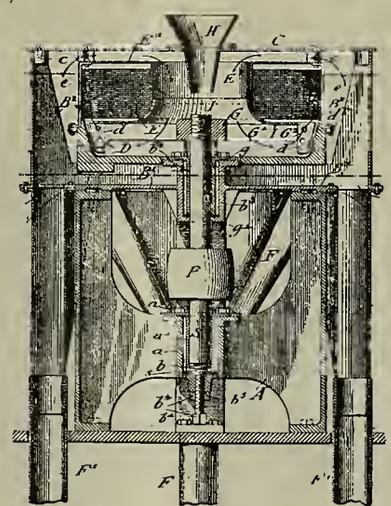
Concentrator comprising shallow pan, means for supporting pan and permitting it to swing latterly without jar, removable lining of fabric covering bottom and lateral sides of pan, and means for feeding ore or pulp to one side of pan, whereby gangue is caused to move across pan and discharged over the other side of pan.

ORE CONCENTRATOR.—No. 744,229; J. W. Pinder, San Francisco, Cal.



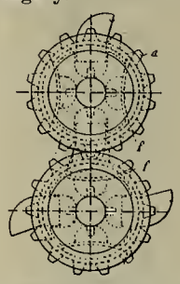
Concentrating pan or table having concave upper surface mounted on central support, that permits it to oscillate in horizontal plane, mercury and amalgam trap at center of table, spiral or involute riffles secured to upper surface of table and terminating at stated intervals on same circle near outer periphery of pan, distributing boxes adapted to deliver pulp at or near outer edge of series of riffles, means for imparting to pan oscillatory motion, and perforated water pipe surrounding outer edge of pan or table.

EXCAVATING MACHINE.—No. 744,490; W. Cole, San Francisco, Cal.



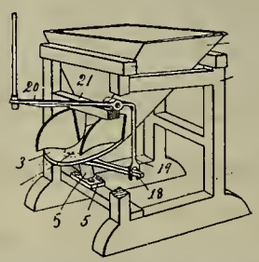
Combination with platform or base frame of a series of swinging arms pivoted to platform or base and projecting therefrom at inclination, hoist cable working over each swinging arm, excavating buckets attached to hoist cables, means for raising and lowering hoisting cables, and mechanism whereby arms are swung outward and inward.

PROSPECTOR'S SMELTER.—No. 744,305; B. F. Daniels and V. W. Clark, Nogales, Ariz.



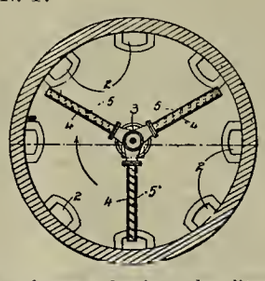
In smelter, combination with combustion chamber, grate in bottom thereof and stone wall inclosing wall of combustion chamber and grate, of muffler located within combustion chamber, crucible within muffler, lateral discharge pipes communicating with crucible, smokestack communicating with combustion chamber and fumestack communicating with muffler.

GRINDING MILL.—No. 744,452; M. F. Abbe, New York, N. Y.



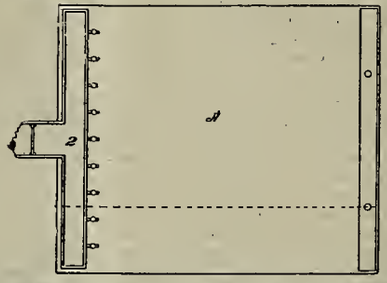
In grinding-mill combination, with stationary grinding-plate having circumferential grinding-ring, of cylindrical screen supported on circumference of grinding-ring, cover for screen provided with downwardly extending interior cylindrical portion, rotary beater arms provided with beaters at outer ends, annular cover supported on beater arms extending with its upper contracted end upwardly to interior cylindrical portion of screen cover, exterior casing provided with cover located at some distance above top of screen cover, and central hopper in casing cover for supply of material to be ground.

CRUSHING ROLL.—No. 744,296; M. Condula, Budapest, Austria-Hungary.



Combination of two crushing rolls forming roller pair, perimeter of which is provided with projections and grooves alternating with each other, projections of one roller registering at suitable intervals with grooves of adjacent roller, flat projecting blades on any of projections, alternating with slots at bottom of grooves and serving for reception of knives.

ORE FEEDER.—No. 744,264; L. R. Tulloch, Angels Camp, Cal.



In ore feeder, combination with hopper, revolving feed table onto which ore is fed having a friction ring connected to revolve therewith, of plate having segment gear and rocking about axis of table, plate having eccentric, arm having collar about eccentric, and friction shoe carried by arm and arranged to engage friction ring by movement of eccentric.

ROASTING FURNACE.—No. 744,359; F. Klepetko, New York, N. Y.

In roasting furnace having plurality of hearths adapted to discharge alternately centrally and through marginal openings, series of pairs of rabble arms rotatable within hearths about vertical axis of furnace, series of angularly disposed blades carried by members of each pair of arms, but set reversely to one another whereby effective radial feed is neutralized, and additional rabble arms rotating conjointly with first set of arms, and blades disposed on additional rabbles for effectively feeding material radially along hearths.

PROCESS OF PREPARING CONCENTRATING SURFACES.—No. 744,322; A. De W. Foote, Grass Valley, Cal.

Process of preparing concentrating surface consisting of commingling petroleum and lime, and spreading same evenly over surface of concentrator.

Mining Summary.

SPECIALLY COMPILED AND REPORTED FOR THE MINING AND SCIENTIFIC PRESS.

ALASKA.

The owners of twenty-eight free milling quartz claims located on the Tanana the past season have consolidated and formed the Fjeld Mining Syndicate, says the Valdez News, with K. J. Fjeld as president and R. Blix as secretary.

C. Lane of San Francisco, Cal., and J. H. Conrad nf Prince of Wales Island, have bought the Heid and Smith mines on Windfall creek, near Juneau, says the Dispatch. The property consists of five claims and develnpment work will be increased.

ARIZONA.

Cochise County.

Next week the Copper Glance mine, near Bisbee, will put a diamond drill plant in operatiou to test the formation in the Glance district. Secretary Barker of the company says the drill is capable of sinking a hole 1200 feet deep, 2 inches in diameter. It will he placed on the 500-foot level.

Gila County.

A discovery of telluride ore is reported made near Rye.

The Old Dominion C. Co. at Globe four-compartment shaft is down 565 feet. The tenth lovel crosscut has heen driven to a point in line with the shaft at depth of 626 feet, and tbe station is heing cut out, from which a raise will he driven. The sbaft is expected to he opened to the tenth level by Dec. 15. Progress has heen made laying track and the rails are laid to the new shaft.

The Globe-Boston M. Co., G. S. Andrews, superintendent, and operating near Globe, bas removed its head offices from Boston, Mass., to Cincinnati, Ohio. Development wnrk is being increased.

At the Globe-Boston C. Co. mine, near Globe, the work of driving the Andrus, or north crosscut, and sinking the winze from the 460-foot level is progressing. At 100 feet in the winze drifts will be run both ways on the ledge. Sinking is also in progress on the Winchell claim of tbe Globe-Boston Co.

Graham County.

A strike has been made in the Northern Point mine, on the Shannon group near Clifton, the ore hody being cut at the end of a 300-foot tunnel. It averages 7% copper across the 60 feet that have heen openod. The Shannon concentrator is ready to receive the other half of the machinery it was built to accommodate. Much of this is on the ground. The completed concentrator will have a capacity for 600 tons of ore daily.

The Arizona C. Co. and the Detroit C. Co. at Clifton are roported preparing to huild a dam below the concentrators for the purpose of stopping tailings. The latter will he hauled from the dam and used for filling in old workings, as the Shannon Co. is doing.

L. H. Dunham has bought the Polin-Nelson-Hathaway claims, near the Copper King and Pilares mines near Morenci. Development work will he increased.

Maricopa Coonty.

(Special Correspondonce).—The Dorris-Heyman Co. has put men to work at the onyx quarries near Cave crcek. Onyx will he shipped to the East.

W. E. Thomas at Liherty reports cutting a hody of high-grade ore in a shaft which he is sinking on his group. The ore is a sulphide and carries values of gold, silver and copper.——A Phœnix company is preparing to work the Union mine, north of Phœnix. A good water supply has heen developed.——It is reported the Garcia mine, near Wickenburg, has been sold.

In the Eagle Tail mountains development work has been started hy the Eagle Tail M. Co. Should the Southern Pacific huild a railroad from Phœnix to Gila Bend, reduction works will he erected hy the Eagle Tail M. Co at some point on the proposed route.——B. Johnson is developing his claims near Morristown.——The Angel M. Co. has hought a group of claims west of Wickenhurg, in Vulture district. Men are at work at the Angel mine. W. Small is superintendent.

The Wickenhurg smelter made anotber run last week. The machinery bas heen repaired, so the plant is ready for a steady run when sufficient ore can be obtained.

Phœnix, Nov. 22.

The Mormon Girl M. Co. has enlarged its mill near Cave Creek to douhle its former capacity.

W. W. Waddington and J. G. Montgomery of Phœnix are preparing to develop their group of mining claims in the Eagle Tail mountains, 18 miles west of Arlington and 30 miles from Gila Bend. The group consists of seven claims. The ledge is 25 feet wide and the pay shoot in the shaft is 4 feet wide. They will sink the shaft to depth of 200 feet before drifting.

Mohave County.

C. T. Kennan of Milwaukee, Wis., has bonded the San Cloud group of mines and has started development work. The properties aro 50 miles west of the Junction.

Pima County.

The oil used in the oil smelter at Tucson is reported to cost 4 cents a gallon, or 32 cents to a ton of ore smelted.

Pinal County.

(Special Corresponcence). — Considerable development work is being done at Superior, notwithstanding the fact that the men went on a striko last week. The strikers' places have been filled by other men.

Phœnix, Nov. 22.

Yavapai County.

Manager J. B. Tomlinson of the Yeager Canyon M. Co. says he will put up a 50-ton concentrating mill for the Yeager Canyon property, near Prescott. Men are grading for the mill. Grading is being done for a 200,000 gallon rcservoir which will he huilt on the hill above the mill. It will be lined with rock and cement. Tbere are thirty men at work in the mine.

Superintendent G. Upton of the Oro Grande mine, north of Wickenhurg, says the company has men at work developing a supply of water to run the 5-stamp mill.

Superintendent Hall has started up work on the Alma group at Groom Creek with fifteen men.

M. C. Parmley of Prescott, of the Dividend Con. G. M. Co., says the company expects to increase the capacity of its mill to forty stamps, in addition to putting in a cyanide plant and heavier mine development machinery.

CALIFORNIA.

Amador County.

Work on the South Eureka mine on Sutter Hill, near Sutter Creek, is suspended, owing to a misunderstanding between the Miners' Union and tbe company.

Calaveras Couoty.

Superintendent Stone of the Red Gold mine, near Murphys, is opening up that property and is putting in a milling plant.——A strike of ore is reported by L. W. Grider, superintendent of the Obio or Cordelia mine at Indian Creek.

The Gold Cliff mine of the Utica G. M. Co., near Angels, will resume operations this week.——The Sultana mine, which has heen closed on account of lack of water, started up tbis week.——The Angels mine hegan work this week after a shut down of one month for repairs. The additional twenty stamps are completed, making forty stamps dropping.

Mining is resuming in and around Murphys, Vallecito and Douglas Flat since the recent heavy rains, says the Citizen.

El Dorado Coooty.

Work is progressing at the Euroka gold mine at Georgetown, operated by the El Dorado C. M. Co. The steam hoisting plant was completed last week and the triple-compartment shaft is down 70 feet.

Fresno County.

At Coalinga the M. K. & T. Oil Co. has one of its wells down 2400 feet deep and the drill is still working. Oil has not yet been struck in paying quantities.——The gusher on section 7, helonging to the Section 7 Oil Co., is still gushing.

Kern County.

The Peerless Oil Co., near Bakersfield, is pumping 5700 harrels per day from twenty-seven wells.

The Junction Oil Co. at Kern river, near Bakersfield, has five wells completed and will start tbis week on No. 6. The company has all its product contracted for, says J. M. Keith, part owner.

The Friday Gulch G. M. Co. will begin operation of the company's mine at Havilah this week. Machinery is on the ground, says H. L. Meacham, superintendent.

W. F. Ernst and S. A. Nelson continue developments on the Pinmore mine at Johanneshurg. The hlacksmith shop, which was hurned with the mill, has heen replaced, and the mill will he rehuilt.

At the Old St. John mine at Sageland at the foot of Piute mountain, near Randshurg, they are huilding a cyanide plant, says the Randshurg Miner.

Mariposa County.

C. C. Plyer, having hought the Barfield interests in the Golden Gate mine at Granite Springs, will, with J. Ruddle, develop the mine this winter.

At the Ward mine, near Coulterville, Manager Ward of San Francisco has twenty-two men at work.

Mono County.

Mon are at work cleaning out shafts and tunnels of the New Bodie M. Co., near Bodie, says Manager C. E. Loose of Provo, Utah.——Men are at work at the Golden Gate mne. Water was struck 60 feet belnw the workings in a winze which was being sunk, and a tunnel is being run to drain the property at depth nf 200 feet. The mill is not running at present.

Nevada Coonty.

The lower tunnel at the Snow Point gravel mine, above Monres Flat, near Grass Valley, which is heing oponed up by the Hudson River M. Co., has been cleaned out and pay gravel found. J. Watton of Bay City, Mich., part owner, says it is proposed to run a tunnel 150 feet lower down, which will tap the channel on the bedrock. Tho tunnel will be 1500 feet long.

In Wasbington district near Nevada City, the Ethel and six other locations have been sold to tbe Gaston Ridge G. M. Co., which is composed of Maltman, Myers, Goodwin, Humphreys, Grissel & Mead. They propose to open up the group and increase development. The tunnel on the Etbel is going ahead and is in 800 feet, and in 60 feet more it is expected the ledge will he cut at 300 feet below the shaft, wbich is 120 feet deep. As soon as tbis work is completed a boist will he placed on the shaft and sinking and upraising to connect the shaft and tunnel done. The ledge on the Ethel is a foot in widtb hut high grade, says the Union. In the spring a mill will he built.

A strike is reported in the Gold Point mine, near Grass Valley. Miller & Johnson, owners, have bad men at work running a tunnel. A shipment of the ore struck sent to tbe smelter gave high returns.

On the 23rd inst. the North Star M. Co., near Grass Valley, finished an 1800-foot raise from the bottom of their Central shaft to the hottom of tbe Nortb Star shaft. The Central shaft was started four years ago and sunk 1640 feet, vertically, in search of the Nortb Star ledge, which was cut at that depth. The company then started the raise, tapping tbe North Star shaft at the 2200-foot level. The raise was made on the vein all the way up, givlng 4000 feet of exposed ledge. A. DeW. Foote is manager and engineer.

The Shady Creek gravel mine, near Nevada City, operated by elevator process under Superintendent T. Graham, bas temporarily shut down. The mine is filled with water, caused by a hreak in the Milton ditch, which runs ahove the property. It is thought operations will not he resumed till spring. They report having heen getting pay gravel.

Plumas County.

Superintendent C. R. Thompson of the Empire mine in Rich gulch, near Quincy, reports development work progressing. The main tunnel is in 590 feet, cutting the ledge at depth of 200 feet, and drifting on the vein is under way. Besides the tunnel, 200 feet of crosscuts have been made during tbe past year. Tbe ore developed carries values partly as free gold, but mostly in sulpburets, which averages 5% of the ore.

Kelley & Borden, owners of the Golden Star quartz mine, 3 miles helow Nelson Point, near Quincy, report selling an interest in their property to J. O. Mercur for Minneapolis, Minn., men, who will incorporate a company to increase development. A mill and reduction works will he huilt.

The Five Bears M. Co. has heen incorporated, with principal place of husiness in Huron, S. Dak., hy G. M. Adams, Jr., J. D. Meidinger and K. S. Wolff of Chicago, Ill., and P. Lawrence and M. Hoke of Hnron, S. Dak. They will develop a group of properties, including the Centennial mine in Genesee valley, near Genesee. With tbe mine a water right is connected, a fall of 1100 feet being ohtainahle.

Sacramento County.

The dredger of the Ashhurton M. Co. of Folsom, which was recently destroyed hy fire, is being rehuilt; electric motors furnish the power, and 7-foot huckets will be used.

Sao Bernardloo Conuty.

The Coloseum mines, Nos. 1 and 2, in Clark mining district, 28 miles from Manvel, have heen sold to F. Langford for $24,000. He has put men at work developing the property.

It is said the Bullion mine, near Copper Camp, 20 miles northwest of Manvel, will be reopened.

The Bagdad M. & M. Co. and the Chase G. M. Co. are reported to have consolidated. The properties are adjoining and 8 miles south of Ludlow. The ore from the mines is shipped to Barstow, where it is treated in the company's stamp mill.

Sao Diego County.

In addition to the Little Blue and Big Pink claims, located by the Fano-Kunzite-Tourmaline M. Co. on Cahuilla mountain, near Cahuilla, eight adjacent claims have been located by the company. Several mincrals and gems have heen found on these claims, including lithia, amblygonite, kunzite and tourmaline. The mountain is well wooded, and at the Fano camp there is a spring nf water. The company has men at work on development.

San Joaqnin County.

At the window glass works at Stockton a flow of natural gas is reported at a depth of 2300 feet, and another well will be sunk to supply the plant with fuel for its furnaces. The well, finished, furnishes 75,000 cubic feot of gas per twenty-four hours. Fuel gas is worth $1 per 1000 feet. Another well of the same capacity will supply sufficiont fuel for the full operation of the glass works.

Shasta County.

Tbe ore body is reported opened up on tbe 672-foot level of the Bully Hill copper mine at De Lamar. It carries native copper and native silver associated, says the Searchlight.

J. A. Guther of Tonopah, Nev., proposes to huild a smelter of 2500 tons daily capacity, near Igo, on Clear creek, in West Side mining district.

The Stockton C. M. Co. bas men at work at its mine, near Pit river, near Burney, building roads and doing devclopment. T. W. Vaughn and J. N. Davis, part owners, say they expect to put in a small smelting plant, as the mine is in an isolated locality and the ore would not pay for shipping to tide water with present transportation facilities. Superintendent Henderson will put on more men.

Sierra County.

The Rosasco quartz mine has been honded to T. A. McCahe et al. of Tonopah, Nev. The Rosasco mine is 4 miles from Downieville.

C. F. Humphrey of tbe Empire quartz mine at Gold Valley, near Downieville, says they will reopen and develop the mine. A. N. Butts is superintendent. In the spring the 25-stamp mill will be started up.

Siskiyoo County.

Manager M. J. Wbitney bas resumed operations on the Pine Grove placer mine, ahove Oak Bar, on the Klamath river, near Yreka.

On French creek, near Etna, 30 miles west of Gazelle, the Scott Valley M. Co., of which J. O. Welsh is part owner, proposes to huild a smeltcr. Gazelle is the nearest railroad point.

The Greenhorn or Portuguese ditcb along Yreka flats, west of Yreka, carrying water from Greenhorn to Hawkinsville, is full, enahling the owners having claims on Rocky gulch and others to work. The Punch Creek quartz mine on Humbug has developed a 5-foot vein, says Manager G. W. Grayson. He will put up a 10-stamp mill, to he operated by electric powor. The mine has hcen renamed the Mono mine.

The M. Mott group, ahove Oak Bar, has been sold to C. Gresswell and W. Harvey of San Francisco, who will work the property extensively in the spring, when machinery will he put in. M. Mott is superintendent. It comprises eighty acres of Klamath river channel.

Trinity Conoty.

It is expected full operations will he resumod at the Chloride mine, near Dedrick, owned hy the Trinity County G. M. Co.

P. Joyce, superintendent of the Mason & Thayer quartz mine near Dedrick, says a 300-foot raise has been made through a body of high-grade ore.

Tuolomne County.

(Special Correspondence.)—The recent storms bave made it possihle for the Tuolumne Water Co. to furnish the mines in tbe county with water for power. United States Forest Ranger G. Taggart reports tbat owing to the unusually mild weather in the mountains there is less snow at the higher altitudes than usual.

The Rawhide mine, near Jamestown, has resumed operations, and will employ 200 men.

At the Republican mine, Jacksonville, development work is in progress. A raise in the ore shoot has heen run from the 200-foot level to the surface, and the twenty stamps will he dropping as soon as the Electric Co. can supply power.

At the Willietta mine, southeast of Jacksonville, ore has heen struck, and a test run is heing made in their 10-stamp mill.

Near Jamestown, at the Crystalline mine, a test run will be made on ore opened up hy recent development work.——The Little Gem mine, near the Golden Gate, near Sonora, has heen sold to S. Smith of Cleveland, Ohio. This mine has heen idle for several years. Smith will

sink to a depth of 500 feet, and run levels at every 100 feet.

At the Bonanza mine, in Sonora, where a pockot was taken out last spring, dead work has heen in progress in preparation for stoping on tbe same sboot. Last week $1400 in two pieces, one of $1000 and the other of $400 value, was picked up on the surface near this property.——Work in the Sell mine is progressing. At 400-feet deptb from the surface a drift has been run south 100 feet to the ore shoot, and stoping is under way,

The Hyapo mine, on the north side of the Stanislaus river, has been bonded by A. M. Divoll & Co. of Sonora, who will put in a compressor plant and operate with machine drills. They will also build 2600 feet of flume and construct a tramway from the road down to the river. Developments consist of a shaft 150 feet deep, a drift of 300 feet to the shoot, and a little stoping. The shoot is 100 feet wide.

At tbe Vine Spring mine, near Columbia, where development work continues, a cyanide plant will be built for the treatment of tbe amalgamation tailings.

Sonora, November 25.

The App mine, at Quartz, will start up with 100 men when electric power is available, says tbe Magnet.

El Rico M. Co., operating the Bell mine, near Tuttletown, is preparing to put up a 20-stamp mill. W. J. Rule is superintendent. The mine bas been developed to depth of 530 feet. Crosscuts at 100-foot level show tbe ledge 40 feet in width, averaging $3 per ton. Tbe tracks of the Angels branch of the Sierra Railroad pass within 600 feet of the sbaft.

F. W. Tallant of San Francisco bas bought tbe Black Hawk quartz mine and millsite near Jacksonville.

E. M. Britton of Santa Clara has taken over an interest in the Slap Jack and the Ora Vesta quartz mines, 2 miles from Groveland.

A. W. Bryant, superintendent of the Prudhommo mine, near Carters, has a bond on tbe Cordova mine, near Arastraville, for $16,000, and will start oporations next week.

The Tuolumne County Electric Powor Co. proposes to run wires and supply power to the mines and mills south of tbe Tuolumne river, near Groveland and Jacksonville.

Superintendent J. F. Campion of the Nonpareil mine, near Groveland, says work has begun on the milling plant to he huilt. The main shaft is down 250 feet, with a station cut and a chute put in. A crosscut will he driven to show the width of the ore body. An adit tunnel will he run from a point above the millsite, which will cut the sbaft at the 150-foot level. This will be 200 feet in length and will give hacks of 150 feet. All rock from the mine will he trammed to the mill by way of this tunnel.

J. M. Quinn has resumed work on the Queen claim, near Big Oak Flat.

The Eagle-Shawmut mine, south of Chinese, resumed operations last week, with 200 miners at work. The mill is run hy water power.

The Big Casino M. Co., near Groveland, has the hoist at the Mack mine in operation. The concentrator room is heing huilt and the roller quartz mill is in operation in the mill. The tramway from the Two Brothers mine to the mill is expected to be finished next week.

COLORADO.

Clear Creek County.

The name of the company oporating the Terrible mine, near Silver Plume, has heen changed to Whiting M. &. M. Co. S. Elkins is prinnipal owner.

The Linn Con. M. Co., near Georgetown, is increasing development work on the Mineral Chief group. Ore is exposed in the upper workings, and the company is opening up the veins at greater depth. The company is starting auotber level from the Moline tunnel, which will give an additional depth of 375 feet. At tbe point in the Moline tunnel where this lateral is started tbey have a hack of 300 feet, and will have 2700 feet of drifting through tbeir ground, gaining maximum depth of 1200 feet, says the Courier.

The Gold Anchor M. & M. Co., at Yankee Hill, has leased the concentrating plant of tbe Unity G. M. Co., at Alice, and has it in operation. It is a 20-stamp mill and ten stamps are dropping. If the mill proves to be adapted to the Gold Anchor ores, the other ten stamps will be overhauled and put in operation. The mine has ore blocked out.

Custer County.

It is reported O. W. Murphy & Co. of Florence propose to build a mill to treat the horn silver ores mined in their Silver Bar group in Custer county.

Gilpin County.

T. Tregay and J. Son have a lease on the Wise Boy claim in Lump gulch, near Rollinsville. The main shaft on the Wise Boy is down 98 feet, and the lessees will sink another shaft 200 feet soutb. They bave 18 inches of milling ore.——Sinking operations have been suspended at tbe General Garfield shaft of the Travis Gulch M. Co. in Travis gulch, near Rollinsville, on account of tbo water being difficult to handle, says Manager Willard. It is expected they will put in plant of macbinery and top buildings to increase developments of the entire group.

Colorado and Eastern men have organized tbe Granville G. M. & M. Co. and merged as its interests the Buckley mining property in Eureka district, the Eagle thirty-five rapid-drop stamp mill and the Alsdorf tailings mill, both on North Clear creek, near Black Hawk. J. Laughran is superintendent. Tbe mine has been developed by a 600-foot shaft and bas machinery equipment and buildings. Tbe company is breaking down ore in the 150 and 300-foot levels, and making daily shipments to tbe stamp mill. The company will deepen tbe sbaft and increase other development work. B. G. Granville, of Central City, is manager.

A plant of machinery and a shaft building bave been put up on tbe Federal mine, near Russell Gulch, and last week Manager R. Hughes started sinking tbe shaft witb double shifts. The shaft is 110 feet deep and will he sunk to 300 feet.

The Mammoth Gulch M., M. & Dev. Co. is operating a group of lode and placer claims near tbe bead of Mammoth gulch at James peak, near Central City, says tbe Register-Call. They are driving a crosscut tunnel whicb is in 100 feet. Work will continue all winter. J. McNerney is superintendent.

Gray & Gilbert of Centerville, Iowa, directors in tbe Mountain Monarch M. Co., operating in Gamble gulch, near Central City, report development work will be increased this winter. The main tunnel is in 300 feet and is being driven to open up tbe Gold Coin lode, between the Setb Thomas and Cbieftain lodes. F. Augustus is superintendont.

The Elk Park M. & M. Co., owning tbe Annie H. mine in Elk Park, near Central City, bas put in macbinery on the Annie H. and the workings have been unwatered. Tbo incline sbaft is down 300 feet. C. A. McNeill is superintendent.

Gunnison County.

Manager Lockwood and Superintendont Boyle of the Brooklyn M. Co., near Elko, report building a wagon road from Elko to tbe tunnel and will move the compressor to that point. Tbe ore can be concentrated and a mill will he huilt hy the company next season.

The Branch mine, near Vulcan, C. Forberg of Lake City principal owner, will be developed.

Hinsdale County.

The Tohasoo mine in Burrows Park, near Lake City, bas closed down for tho winter.

Lake County.

The surface plant on the Fortune mine, near Leadville, has been completed and tbe machinery set up. Shipments amount to forty tons of ore per day.

The Leadville Deep Mines Co. has been formed by S. Collins et al., says the Carbonate Chronicle, to reorganize and consolidate the Big Evans, Arnold, Reno and Empire companies at Leadville.

Osgood & Sullivan, lessees on the Sixth Street shaft at Leadville, will close the property down indefinitely. They have been mining in the upper ore horizon, and in addition to shipping considerable iron ore, have heon prospecting. With the retirement of the present operators from the Sixth Street, it is thought the property will he merged with the Coronado-Midas combination.

The shortage of cars is again in evidence, says the Leadville Chronicle. While the advent of railroads to mines has done much to bring cheaper transportation, it has also, in a measure, placed the properties at the mercy of the roads, so far as cars are concerned. The coal strike has something to do with tbe present situation. Coal dealers, large manufacturing establishments and other concerns are demanding coal, and every car that can be utilized is hauling coal. But the result is bearing hard on tbe local mining industry, shifts heing laid off. The Coronado, which is in position to ship 250 tons a day, is doing little. The A. Y. and Minnie mill is also closed down for the same cause. It is estimated the production is curtailed 1000 tons a day by this cause.

Churn drills are in operation and also diamond drill explorations under way on an area of placer ground south of California gulch, near Leadville. The property to he prospected includes the south half of tbe G. H. Quigg, Mike and Little Sister lodes, covering an area 2 miles long and a quarter of a mile wide and owned hy F. W. Owers. There will he a series of drill holes put down 1000 feet apart, the churn drills to penetrate the wash and the diamond drills in the rock work, says the Carbonate Chronicle. The blue limestone horizon extends along the territory.

Few Leaville mines will be affected by the coal strike, as the railroads and coal dealers have given the mine managers an assurance of an ample supply of coal, says the Carbonate Chronicle. Tbe larger mines have filled tbeir bins, and are increasing their supply as fast as transportation facilities will permit. The closing of tbe steel works will affect one or two properties wbich are shipping manganese.

Mineral County.

The ore output of the mines of Creede district for 1903 to Nov. 15 is as follows:

Month.	Tons.
January	5,283
February	5,788
March	7,072
April	5,715
May	5,645
June	5,711
July	5,636
August	6,896
September	6,891
October	6,914
November (to 15th)	2,747
Total	63,798

Park County.

A six years' leaso and option on tbe Moose group on Mt. Bross, near Alma, bas been given to J. Moynahan of Alma. Work bas hegun. The buildings are being repaired and the tunnels and other openings cleared.

Saguache County.

V. A. Robinson, chemist for the Steel Canyon M., M. & I. Co., oporating near Villa Grove, reports the presence of bismuth in their ores in values varying from $40 to $60 per ton. The metal occurs with the lead ores and in tbe extraction tbe lead would be recovered as a bi-product in marketable form. Should quantity of the ore warrant, the company proposes to build a plant for treatment on the ground.

San Juan County.

The Astor M. & M. Co. bas reacbed 800 feet on its crosscut tunnel wbich is being run at tbe moutb of Picayuno gulcb, near Silverton, and when completed will be 1200 feet in lengtb. It will cut the Toltec system of veins. The vein is 40 feet in widtb. When the vein is cut 700 feet depth will be attained. In tbe upper workings a milling proposition is indicated, and should the lower tunnel prove the same cbaracter of ore a concentrating plant will he huilt near the mouth of the tunnel, where the company holds a millsite and water power plant of 250 H. P., says Superintendent E. C. Condit. Tho railroad bas been completed to this point and passos just where the mill will he located.

San Miguel County.

F. Parker and C. Harris have a lease on the Yellow Girl, one of the loads of the Suffolk group, near Telluride, and have started work. A lower tunnel will he driven to get under the old workings.

There are twelve men at work at the Nellie mine, near Telluride, on development, and considerable ground has beeu opened since beginning of the strike, says the Telluride Examiner. C. Anderson, manager, will keep a few men at work all winter, or until the mills resume.

On the 24th inst. 500 members of the State militia arrived at Telluride and are encamped ahout the mines and mills of the district. One hundred men wore sent to Ophir Loop and Eames Station, 16 miles southwest. The Tomboy G. M. Co. is arranging to resume.

Summit County.

The Fremont-Vineta M. Co., near Breckenridge, has sold its holdings on the Swan to J. M. Thomas, and the El Dorado M. Co. has heen incorporated to operate the group. Mr. Tbomas will have general charge of operations.

Near Kokomo the Iron Mask mine, on Sheep mountain, is producing steadily. Sinking on tbe ore shoot shows copper sulphides with the iron.

Teller County.

Manager Bainhridge of the El Paso mine, on Beacon Hill, at Cripple Creek, says he is hreaking as much ore now as at any time in tbe bistory of the mine. Tbe ore is of average grade. The work of extending the drainage tunnel from the El Paso shaft, to cut the dikes that show in the top of Beacon hill, continues. However, it is not expected to be completed before the first of the year.

The Findley mine on Bull hill, Cripple Creek, bas fifty men at work in two shifts, and is shipping out a carload of ore a day, consisting of twenty-five tons, which gives returns of $25 per ton. The new hoist, similar to those on the Ajax and Strong mines, will be in oporation hy January 1.

C. C. Hamlin, secretary of the Mine Owners' Association at Cripple Creek, says the coal strike will not interfere with the mines of Cripple Creek camp. Many of the large mines are well supplied with coal, having enough on hand to run them for sixty or ninety days. The strike is over, in so far as tbe association is concerned; all of the properties are working, and will continue to work. Additional shifts are being put on.

Tbe shaft of the Granfiold lease on the C. K. & N. mine on Beacon bill, Cripple Creek, is down 525 feet and will be put to 600 feet. Two levels will be run, one at 450 and the other at 525 feet, to open tbe vein. Granfield will make tbe 525-foot level the main workings for the lower portion of the mine, as this is just tbe level of the El Paso drainage tunnel, and it is bis intention to connect the two mines at this depth. To do this it will be necessary to drive 300 feet from the 525-foot level connecting with a drift being run out by the El Paso Co. on the C. K. & N. vein in tbe former's ground. The lower C. K. & N. vein is slightly higber than tbe El Paso tunnel in order to give drainage, as it is intended to put in a pump in the C. K. & N. shaft to lift the water from tbe lower portion of that mine into the 525-foot level. Tbe C. K. & N. Co. management reports tbe El Paso drain is draining tbeir property so that tho water level is considerably lower than where tbey were working in tbe main shaft.——The El Paso Co. will increase its production in November to 1800 tons (output of October, 1000 tons). At tbe mine forty additional miners have been put to work, making 150 men on tbe payroll. This equals the output before the strike. The vein opened in tbe 500-foot level is improving. The drainage of the mine through the tunnel is discbarging 1600 to 1800 gallons per minute.

Several arrests have been made by the militia for suspected connection witb the explosion in the Vindicator mine, at Independence, which killed Superintendent McCormick and Foreman Beck. Evidence being collcted shows it was the result of a plot, and similar plans, involving two other mines in tbe district, are reported to havo been discovered and frustrated.

IDAHO.

Boise County.

Tbe Ingle M. Co., which bolds bonds on the Belsbazzar, Mountain Chief and Centennial quartz claims near Placerville, has made first payment and has operations under way. The claims show ore, the values being mostly in iron sulphidos. The Belshazzar ledge is 12 feot wide and has been doveloped to depth of 125 feet by tunnel.

Blaine County.

H. J. Hoyt of Muskegon, Mich., and F. M. Cook of Chicago, Ill., et al., have takon up the option on the Red Elepbant group of mines near Bullion, near Hailey.

Tbe Idaho Con M. Co., Ltd., owning twenty-five claims in Hailey district, has men at work. Its operations thus far are limited to claims on tho Minnie Moore vein between Star gulch and Broadford, where eighteen miners are working, besides teamstors getting in timbers and supplies. Next spring it will oxtend its operations to its other claims at and near Bullion.

The Minnie Moore mine, near Hailey, is shipping 1000 tons of ore per montb, the ore averaging 124 ounces silver and 50% lead. There are 100 men employed hy the Minnie Moore M. Co.——The Crœsus mine is sinking 1000 feet and 4 feet of ore have heen cut.——The Idaho Democrat is producing and making regular shipments of ore.——The Comet group on Deer creek is heing opened up.——Tbo Idabo Con. M. Co. has startod operations on its mines near the Minnie Moore.——Miners are said to he scarce around Hailey.

A. Brown of Salt Lake City, Utab, says the reported sale of tbe Red Elepbant group, near Hailey, did not occur.

Vancil & Carpenter report a strike in the Idaho Wonder group of five claims on Muldoon creek, 4 miles east of the Muldoon smelter and 28 miles from Hailey. The W. O'Connor group of eigbteen claims in Garfield guloh is west of the Idaho Wonder. In the Wonder the ledge outcrop shows a hody of ore 200 feet long, which contains 14 inches of galena assaying 70 ounces silver and 55% lead. The vein has heen stripped for 30 feet.

The Quincy Junior M. Co. has heen incorporated at Salt Lake City, Utab, to develop a group of claims in Mineral Hill mining district hy W. V. Rice, H. J. Hoyt and W. W. Armstrong.

Canyon County.

Manager R. B. Hennehery will start work on the Badger Girl group of mines west of the Dewey claims, near Emmett, next week. It is intended to sink a 200-foot incline shaft following the ledge. Hennebery is putting in a sawmill on Cottonwood to get out timbers for the mine.

Kootenai County.

At Tyson the Tyson Con. G. M. & M. Co. has settled its diffcrencos between

Neil, Tyson Bros. et al., and has bought the entire property. The deal, with the properties under option by the Con. Co., will give it 500 acres of proved placer ground. The amount paid for the Gold Nugget, the property in dispute, was $15,000. The company will put in a pumping plant, so as to have a continuous head of water for hydraulic mining. R. Neil says that when the hydraulic plant is in operation the ground can be worked eleven months in the year.

Latah County.

A. Walker, of Butte, Mont., has bought the Blue Diamond mines, near Moscow, and the Central Idaho M. Co., Ltd., will be formed to develop it. A 14-inch vein of ore has been opened that assays $14 per ton. A mile and a half from the Blue Diamond is the White Cross, operated by Moscow men with a 5-stamp mill. The company is preparing to put in an air compressor. They have been operating a steam drill.——M. J. Shields, owning placer ground 6½ miles from Moscow, will put in a dredge.

Lemhi County.

A discovery of tin in paying quantities is reported made near Salmon City by N. J. Andrews and J. M. Langsdorf. The ore has been assayed, showing 13% tin, says the News.

Owyhee County.

The Addio mill near Silver City is in operation on ore from the dump at the Empire mine. It will also crush Morning Star ore.

Shoshone County.

The North Franklin mine, near Mullan, will drive a tunnel 800 feet in length. The North Franklin consists of six claims adjoining the Morning mine side lines on the north, and this tunnel will be run about on a level with No. 5 tunnel of the Morning mine. The company expects to secure compressed air from the Morning plant for this work.

W. J. and W. S. Harris of Spokane, Wash., operating placer and lode holdings near Pierce City, say they will increase work in the spring. A two-compartment shaft will be sunk on the main vein. Two tunnels will also be started on the other two claims of the group. The placer ground which they will work lies along Orofino creek and comprises 160 acres. The ground is flat and averages 20 feet in depth to bedrock. Six prospecting shafts have been sunk. Four dredges, to be run by electricity, will be put on the ground. Some of the ground which was worked in former years, will be worked over by the dredges.

Washington County.

It is reported that the American S. & R. Co. has secured options and bonds on forty copper and lead properties in Heath mining district, 50 miles from Weisor. It also secured options and bonds on a number of claims in Sevon Devils district.

KANSAS.

Cherokee County.

The Murphy M. & R. Co. of Empire has been incorporated by J. and R. Murphy of Empire, with W. L. Crockett, H. C. and B. Murphy and W. J. Leffen of Joplin, Mo. They will operate in Empire district.

MICHIGAN.

Houghton County.

The Isle Royale mine, near Houghton, has stopped diamond drilling, after securing a complete cross section of its lands at a point 1 to 2 miles south of the present workings, and the machine has been removed to the Cliff mine, in Koweenaw county, where the drill will supplement and complete the exploratory work begun by trenching across the formation, says the Record.

The Mesnard shaft of the Quincy mine, at Hancock, is roported making a satisfactory showing, especially the bottom or eighteenth level, in the drifts extending to the Franklin boundary. A good showing is also made in the tenth level south.

The October yield of the Baltic mine, at Painesdale, was 720 tons of mineral, or over 1,000,000 pounds of refined copper. Baltic rock is said to be hard and in the matter of tonnage treated the mill results have not equaled the average of its neighbors. This feature has been overcome by the installation of sets of rolls by which the coarser rock is treated, with the result that one of the Baltic stamps has crushed 590 tons of rock in twenty-four hours, and also treated 550 tons of rock daily for an extended period. It is estimated that the four stamps will be crushing 2200 tons of rock daily before the end of the year. But little waste rock is hoisted, the surface discard varying from 4% to 8%.

Ontonagon County.

At the Michigan mine, at Rockland, the air compressor is in operation. Sinking and other extension of openings has been suspended temporarily, so that the stopes may be put in shape to feed the mill. Sixteen drills are working. The number will be increased. B shaft house will be ready next week. The Michigan mine management has decided, in lighting the rock house and power house, to use acetylene gas instead of electricity. Rockland, where the mine is situated, is said to use acetylene gas quite generally for illuminating purposes.

MISSOURI.

Coal is said to be mined in marketable quantity in thirty-seven counties in the State, the coal area covering 23,000 square miles and the annual production being of $5,000,000 value.

Christian County.

Of the iron ore recently found at Billings seven cars shipped to the St. Louis Blast Furnace Co. gave returns of 58% iron, says the News-Herald. The company, which has been organized, will put up blast furnaces at the mines.

Jasper County.

F. R. Breckwith, manager of the Premier M. Co., has put in machinery to sink a shaft on the Guinn land, north of Webb City. At depth of 200 feet the drill cuttings show an 18-foot face of zinc ore.

Prospect drilling is under way on the Holon Hare lease, near Joplin, for L. Winters.——The Ricksecker shaft on the Shoman lease is below the first 6-inch vein of coal struck. A core drill will be sunk to prospect the ground.

Lawrence County.

At the Bolle Alice mine, at Aurora, owned by J. T. Barbre & Co., a drift is being cut at depth of 167 feet, in which a body of ore has been faced up 50 feet in height by 30 feet in width. The company proposes putting up a mill.

MONTANA.

Cascade County.

The Cottonwood Coal Co. will increase operations at its mines at Stockett. The Great Northern has given orders to continue the movement of coal from the Stockett mines to its supply points between Devil's lake and Chester.——At Belt there are seventy pick miners steadily employed.

Deer Lodge County.

M. J. Kirkpatrick, who has been working a small mill on his mine at Nine Mile on Mill creek, near Anaconda, says they have discontinued for the winter, as the snow is too heavy there for work to be carried on successfully.

Fergus County.

J. Borg has bought the Bright one-third interest in the coal mine of the Spring Creek Coal Co., 3 miles up Spring creek from Lewistown, for $7000. This makes Borg & Green sole owners, who control 600 acres of coal land. They have thirty-five men employed in the mine. Considerable development work is being done, and they are taking out fifty tons per day. They are sending two carloads a day to points along the railroad, and this demand is said to be increasing. The vein runs 4 to 5 feet in thickness. Next month they expect to be taking out 100 tons a day.

M. Soloman of Kendall has bought the Missouri lode in North Moccasin mining district.

R. E. Hamilton has leased the W. G. Norman coal mine, 8 miles east of Lewistown, and is preparing to work the property. The mine will be developed to produce at least fifty tons per day.

A one-half interest in the J. J. Bullard group, adjoining the Barnes-King claims, near Kendall, has been sold to F. S. Wiedenborner and A. F. Lehman, of St. Paul, Minn., who will increase development work, with J. J. Bullard as superintendent.

C. A. Case, of Lewistown, has bonded the Bertha group of mines, in Cone Butte district. The group contains ten claims. An experimental cyanide plant was built the past summer and worked successfully until cold weather interfered. Surface assays run $4. According to the terms of the bond, Case will build a mill within one year. Development will be increased.

Flathead County.

A. Brown of Libby, part owner of the Huron group of claims in West Fisher district, says development work is under way on that group, which consists of the Huron, Goat Mountain, Mountain Forest, Gold Nugget and O K quartz lodes and the Holiday placer and Snowcloud millsite. The lode claims are on Great Northern mountain and the placer and millsite are on Fisher creek. The principal development is on the Huron. The ore carries free gold. Salt Lake City, Utah, men are negotiating for the group.

Jefferson County.

A gold strike is reported made on the slope of Gold Flint mountain, near Clancey, by W. Brown in an abandoned prospect. A portion of the side of the tunnel had caved, showing a streak of ore 10 inches wide, showing free gold assays.

Lewis and Clarke County.

The Cokedale coal mines, which have been idle for several years, have been unwatered after six months of steady pumping. The collieries are owned by the Amalgamated C. Co.; 300 men will be put to work and coal mined for the company's smelters at Anaconda, Great Falls and Butte. The operation of the Cokedale mines is expected to lessen the production of the coal mines at Diamondville, Wyo., and Pleasant Valley, Utah, where the Amalgamated Co. is now getting the greater part of the fuel used in its mines and smelters.

NEVADA.

Eureka County.

(Special Correspondence).—A shipment of eight tons of ore from the McNaughton mine, adjoining the Silver Connor, near Eureka, has returned $1080 net to the owner, J. McNaughton. This is the first shipment made for several months.

N. Daily will develop his Montezuma group of mines in the Diamond range this winter.

R. Robinson, working the Old Bay State mine at Newark, has taken out a shipment of ore assaying $50 per ton. The ore carries some copper. Native silver in paying quantities is carried by the ledge, which is 3 feet in width.

W. Laird and D. Morris are working their Sunset claim, west of the Albion. The ore shows silver chlorido.

The Eureka Con., the Richmond and the Diamond mines continue to make regular shipments of lead carbonate, carrying gold and silver. Ore is being taken from the sixth and ninth levels in the Eureka and a 200-foot drift on the third is showing values. Ore is being taken from the first and fourth levels, below tunnel No. 1, in the Diamond, and a crosscut is being run from the tunnel level west, which is in the limestone, 300 feet. Tributers are working from a winze below the main tunnel in the Richmond, and also in the sixth level of the 1200-foot shaft.

Eureka, Nov. 24.

Esmeralda County.

The Douglass mining property, southwest of Tonopah, has been sold to E. G. Minard of New York for the Tonopah M. & Ex. Co. of New York. The property consists of sixteen claims and a mill with water sufficient for milling purposes.

In Goldfield district, south of Tonopah, the Blue Bull group was bonded to J. P. Sweeney for $100,000. It has ledges showing gold values and comprises nine claims 1 mile east of the Combination group.

Lander County.

T. H. Borland of Oakland, Cal., superintendent of a group of claims in Blue canyon, near Battle mountain, which he has been developing, says operations are suspended for the winter. They will resume in the spring and a mill will be built.

Lincoln County.

A body of ore has been struck in the Wild Irish claim at Pikes Diggings, near Pioche, owned by Hollinger Bros. and D. Francis. They have men at work and the main shaft is down 100 feet with crosscut in the bottom showing a 10-foot ledge of free-milling gold ore. The owners propose to build a 30-ton capacity mill at the mine.

Nye County.

Turquoise is reported found ½ mile from Ray, north of Tonopah, by A. Kunze. He will develop it by sinking a shaft.

Washoe County.

At Olinghouse a prospecting core drill has been put in operation at mill No. 1 to get an artesian flow of water for the Springfield-Nevada M. Co. Lumber is on the ground for the Olinghouse stamp mill. Superintendent E. H. Proctor says he has mill No. 1 ready for custom work.

White Pine County.

Near Cherry Creek the Joanna mine deal, between W. Watson, the owner, and Cripple Creek, Colo., men, has fallen through, says the Cherry Creek Miner.

A new rate of $13 per ton on ore has been made from Cherry Creek to Salt Lake City, Utah, by the Southern Pacific Railroad, if same is shipped via Toans.

NEW JERSEY.

Morris County.

Notices were posted on the 24th inst. by the Empire Steel & Iron Co. in Mount Hope, Hibernia and the other mines in this county to the effect that a 10% reduction would be made in the wages of all miners, beginning Dec. 1. Also, that only one shift of men would be used where two formerly worked. The order affects 3000 men. This is in addition to the cut of 15% made Oct. 1, the shutting down of the Wharton mines and the blowing out of the Port Oram furnaces.

NEW MEXICO.

Bernalillo County.

Development work will be increased on the Nuestra Senorita de los Milagros gold mine in Hell Canyon, near Albuquerque. C. M. Nelson, Jr., of New York and A. F. Wuensch of Denver, Colo., are interested. A shaft is down 120 feet.

Sandoval County.

Another retort has been added to the equipment at the sulphur works of M. S. Otero at Sulphurs. The weight of the retort is 4600 pounds, and six horses were required to freight it from Albuquerque to Sulphurs, says the New Mexican.

Socorro County.

A company has been organized at Clifton, Ariz., by G. Williams, R. Wayland, C. Pinckney, C. Goldon, E. Gray, J. Kirby, M. Todd, G. Gray and A. Charles, to develop coal and oil prospects near Socorro.

OREGON.

Baker County.

Topping and Whittier of Sumpter, who have a bond on 160 acres of placer ground in Dead Mule gulch, are preparing to increase work. The plan is to prospect up the main gulch to define operations for the spring. The property is equipped with one giant, and they propose bringing in another ditch which will increase the water supply and lengthen the season.

N. Berkley of Pendleton, having a bond on the Buffalo mine, in Magnolia district, says he is arranging to reopen the mine. The Buffalo has been idle for two years.

Operation of the 10-stamp mill of the Octo M. Co. on the Elkhorn slope, near Baker City, began last week, says Manager A. B. Patterson.

Douglas County.

A. E. Carlson et al. last week bonded the Rowley copper group at Riddle for $50,000, says the Roguo River Courier. Work has been resumed.

Grant County.

The 5-stamp mill on the Colorado mine, in Quartzburg district, near Granite, owned by the Equity M. Co., is in operation, says Manager W. J. Hughes of Baker City. The plant has been overhauled and a table concentrator added. The mill is ½ mile from the tunnel on the Colorado mine and ore is haulod down by wagon. Development work continues.

Josephine County.

The Capital City G. M. Co. of Sacramento, Cal., has made final payment on the Baby mine, in Jump Off Joe district, near Grant's Pass, which it has had under bond. C. C. Higgins is superintendent. The ore carries free gold. The mine is being developed by a tunnel, tapping the ore body at depth, drifts being run on the vein.

The offices of the Golden Drift M. Co. have been changed from Chicago, Ill., to Grant's Pass, near which are located the mines of the company. Manager M. C. Ament says work is progressing on the dam being built on Rogue river. There are fifty men employed and they are filling up the 12-foot cribs with rock and earth, which is hauled on cars and dumped directly into the pits by a system of cables operated by a gasoline engine. The cars are filled by a steam shovel. The dam has a width of 120 feet on the river bed and 16 feet on top, while the length of the dam is 700 feet. There will be four 18-inch, five-step compound centrifugal pumps, each of which will deliver 9000 gallons of water per minute, which will raise the water from the reservoir, says the Rogue River Courier. This will supply water for six pipes equipped with 2⅜-inch nozzles. Power will be generated by sixteen 46-inch turbines working under a 20-foot head, and developing approximately 5000 H. P. Generators will be installed and electric power transmitted.

Colorado parties have bought the Queen of Bronze copper mine, on Illinois river, near Waldo, and they are increasing development work under Superintendent A. Murphy. A vertical shaft will be sunk for 500 feet.

The Gold King M. Co., which is developing the Gold King mine, on Josephine creek, near Grants Pass, has bought the adjoining placer claims of Bour & Day. These claims are accompanied by water rights, which will be used in supplying power for developing and working the Gold King mine.

SOUTH DAKOTA.

Lawrence County.

The semi-monthly cleanup by the Spearfish Co. last week produced $16,000 in gold bullion. The foundation has been

laid for the air compressor at the mill. This machine will have capacity to operate twelve drills, and to convey air to the mine will require 3500 feet of piping. The company propose the addition of a third more tanks to the leaching department.

The 20-stamp wet crushing cyanide mill of the Lexington Hill G. M. Co. in Spruce gulch, near Deadwood, was closed down last week temporarily pending placing of amalgamating plates, says Manager E. F. Woodworth. The character of the ore has changed. The ore is mined from the Cambrian ore measures and tests show it to carry free gold. The ore will be crushed in water, amalgamated and concentrated and then cyanided. Tahles will be used for the concentration.

After a shut down of several weeks, during which time the process of treatment has been changed, the 60-stamp mill of the Hidden Fortune M. Co., near Lead, is again in operation. The slimes capacity of the plant has been increased by the addition of three vats 16 feet deep and 24 feet diameter. This gives the slimes plant eight vats, five of them being 16 feet deep and 12 feet diameter. To save the free gold an equipment of silver plated copper plates has been put in at the lower end of the mill, over which the sands will flow after having been subjected to cyanide treatment. Riffles are also set between the batteries and the vats in the launders through which the pulp flows to save the coarser particles of free gold.

Work has been resumed on the Safe Investment group near Greenwood, on Box Elder creek, 6 miles southeast of Perry, says W. H. White of Chicago, Ill., who is interested.

The Tinton M. Co. at Tinton has the framework of the tin reduction plant up, and the machinery is being set up.

Manager McLaughlin has the entire 120 stamps of the Horseshoe mill, near Terry, dropping, says the Lead City Call. Superintendent Griggs says the machinery is working satisfactorily.

TEXAS.

The Reporter says it is estimated hy operators familiar with the situation that 13,000,000 harrels of oil, the product of Sour Lake (Hardin county) and Beaumont (Jefferson county) wells, is in storage at present. The principal stocks are estimated as follows: J. M. Guffey Petroleum Co. (Sour Lake, Beaumont, Port Arthur, New Orleans and eastern stations), 4,500,000 barrels; Security Oil Co., Burt refinery (Beaumont, Sour Lake and Sahine Pass), 3,000,000 harrels; the Texas Co. (Beaumont, Sour Lake, Port Arthur, Sahine Pass and New Orleans), 2,000,000 harrels; Southern Pacific Co. (Texas and Louisiana points), 1,500,000 barrels; Higgins Oil & Fuel Co. (Beaumont and Sour Lake), 500,000 harrels; Sun Co. (Beaumont, Sun and eastern stations), 200,000 harrels; Santa Fe Railroad (at various points on Gulf division), 200,000 barrels; International & Great Northern Railroad (points in Texas), 100,000 barrels; Sour Lake and Beaumont (miscellaneous storage), 1,500,000 harrels. On August 1st the amount of Texas oil in storage was put at 7,500,000 to 8,000,000 barrels. The increase since that time is attributed directly to the large production at Sour Lake. For a while the production there was 75,000 barrels a day, though it has now fallen to 55,000 barrels daily. The pipe lines of the Guffey Co. and the Texas Co. are taking from 24,000 to 26,000 harrels a day to Beaumont and Port Arthur. The Southern Pacific Co. from the 1st to the 12th of October averaged eighty-six cars a day, including all shipments. Most of these cars are of 300 barrels capacity each.

UTAH.

Beaver County.

Operations will be resumed at the Copper Ranch and the Copper Mountain mines, of which B. T. Lloyd of Salt Lake City is manager.

Box Elder County.

The Barker M. Co. has been incorporated at Ogden to develop a group in Willard mining district by J. N. Barker, H. E. Steele and B. Ternes.

Carbon County.

Superintendent N. F. Cameron last week posted the following notice at the Winter Quarters mine, near Scofield, says the Trihune: The company will raise the price of $2.50, paid to inside drivers and day men, to $2.75 per day, and the pay of hoys will he raised proportionately. Also the price of $2.75, paid to inspectors, head timhermen and head tracklayers, will he raised to $3 per day, while outside laborers will he given an increase of 10%. In addition to the above, the mine superintendent will make the pay of miners working in places where they have to contend with water, bad roof, clod or any other drawhack so that the pay of such miner will equal the miners' average earnings throughout the mine under average conditions.

The entire State militia, numbering 400 men and consisting of infantry, artillery, cavalry and signal corps, has heen sent to the coal fields of Carhon county—Scofield, Sunnyside, Winter Quarters and Clear Creek. This action of Governor Wells was taken after official investigation into the conditions in the striking camps. Brigade headquarters have been established at Scofield. State Coal Mine Inspector Thomas reports that more miners are on strike than has heen previously reported. At Sunnyside less than 100 men out of 850 are at work. At Castle Gate only twenty-four men are at work. The main point of difference hetween the miners and their employers is recognition of the union, and this the coal companies refuse to consider.

Joab County.

The Bullion-Beck mill at Eureka will he put in operation, and hy January 1 will be treating 300 tons of ore daily, says the Tintic Miner. W. H. Peck, who has a lease on the low-grade ores that have been accumulating in the old workings of the mine, is repairing and adding to the machinery. The plant will keep fifty men at work.

The holdings of the Silver-Copper King M. Co. of West Tintic, near Eureka, have heen sold to W. Groesbeck of Salt Lake City for Eastern men for $50,000. Work will he started this week to develop the veins which are exposed on the surface.

Plute County.

The Surprise G. M. Co. was incorporated last week at Salt Lake City to work a group in Gold Mountain district, near Marysvale. The officers are W. James, W. F. Snyder, W. Armstrong and H. G. Fisher.

Salt Lake County.

Operations will he resumed this week at the Peruvian mine at Alta, says Manager Clays. During the winter work will he directed to the tunnel to cut the vein. After this a raise will be made and a drift-hack he cut. The ore carries copper values.

The ores forwarded hy the Boston Con. of Bingham to the furnaces of the United States M. Co. are maintaining an average of nearly 8% copper, with $2.50 gold and some silver, says the Trihune.

The Highland Boy Con. M. Co., owning and operating the Parnell group of mines at Bingham, has been taken over hy A. J. Orem of Salt Lake City, as president of the Apex M. Co., operating in same camp. The consideration is said to he $150,000. Just what influence the transaction will exert on the litigation existing hetween the Highland Boy Con. and the Petro M. Co. is not known, hut it is thought action will be called off. The Highland Boy Con. adjoins the Highland Boy mine.

The Ohio C. Co. has heen organized at Miamisburg, Ohio, with H. Catrow and A. J. Bettles as officers. This company recently took over the holdings of the Columbia M. Co. at Bingham for $225,000. The ores in the All's Well ledge show 13% copper in addition to the silver and gold, says Manager Tibhitts.

The Dewey mill in Bingham canyon, near Bingham, is in operation on second-class ores from the Fortune mine, says R. Bemis, manager.

Another copper furnace will he added to the equipment at the United States smelters, near Salt Lake City. This will be No. 6, and it will hring the smelter up to its full capacity, says Managing Director Holden.

An electric locomotive will be put in hy the Boston Con. C. Co. of Bingham on the Copper Belt railroad.

Manager J. P. Sprunt of the Kilmenack mine, 12 miles north of Salt Lake City, says the tunnel which is heing driven to cut the vein at depth of 250 feet helow the surface has 110 feet remaining to be driven. The ledge runs east to west and is 8 feet wide at the surface, showing copper. The concentrates show a value of $24 gold, 11% copper and 38% iron.

Operations will be resumed at the Galena mine at Bingham by the United States M. Co. Superintendent Leon will put up a shaft house and other surface improvements and begin development.

The Shawmut M. Co. property at Bingham, consisting of the Cuha group of eight claims and the Shawmut mill, was transferred to E. W. Foote, C. A. Hardy and E. F. Barnes for $9100, being sold under foreclosure. It is expected they will increase development.

Sanpete County.

A hond and lease on the Viking mine of Sanpete county has heen given to J. N. Jacobson of Salt Lake City, who will hegin development work next week.

Summit County.

An electric plant, including 100-kilowatt three phase, 60-cycle generator, has heen put in at the Daly-West mine, at Park City, for supplying power to the slimes plant, and to the crushing machinery to he added to the mill; also, for lighting the mill and mine, and for the surface plant of the Quincy mine.

Negotiations are reported under way hy the Diamond-Nimrod M. Co. to buy the West Ontario group of claims, near Park City. A cage is heing put in at the shaft and the 85 H. P. boiler and 65 H. P. engine are in place. Sinking will he resumed. The shaft is down 170 feet and will be sunk to the contact vein. A 2800-foot water line has heen laid from a spring on the Daly-West ground.

S. Spiro, of the Silver King Con. mine at Park City, says the new plant at the mine is in operation.

Tooele County.

A. Murphy has a hond and option on the Daisy mine, on the west dip of Camp Floyd district, near Mercur, says the Mercur Miner, and has begun operation of the property, wbich is equipped with a cyanide mill.

The holdings of the Silver Eagle G. M. & M. Co. of Chillicothe, Mo. (formerly the West Argent M. Co.), at Stockton, have heen leased hy Mackelson & Cornue. The Honerine tunnel is draining a portion of the Silver Eagle ground.

Manager Trenam of the Stockton mine, at Stockton, says a double station is heing cut at the 700-foot level and drifting will be started at east and west from the shaft. On the 600-foot level the drift is nearing the vein which was opened up on the 500-foot level which showed values. ——The frame of the Honorine mine is going up.

Utah County.

Gold ore is reported found near Springville.

Weber County.

At the Southern Pacific mine, near Ogden, Manager Burnham of Salt Lake City reports work going ahead. A main tunnel is being run to open the ledge several hundred feet below the surface. Work is also being done in the shaft. Assays of the ore show values of 15% copper.

WASHINGTON.

Okanogan County.

At Bodie the Gold Dust mine, adjoining the Bodie mine on the north, has been sold to President Parker of Spokane of the Toroda M. Co., operating a group south of the Bodie.——E. J. Delhridge, manager of the California mine, near Republic, has taken an option on the Elk group, 2000 feet east of the Bodie mine, on a parallel vein, and W. G. Madison, president and manager of the Bodie M. Co., has a bond on the Agitator group, 1 mile east of Bodie.

Snohomish County.

Improvements will be made at the smolter at Everett to the extent of $100,000, says Manager E. B. Braden of Helena, Mont. The Everett plant will employ 150 men at the start. Bradeu will also he in charge of the Monte Cristo mines, which will be worked by the company.

Stevens County.

J. Gray of Spokane, manager of the Crystal M. Co., says a smelter will be built at the Crystal mine, ¾ of a mile from Fort Spokane and 25 miles north of Davenport, on the Columbia river. When tho smelter is running they will mine 100 tons a day. There are 3000 tons of ore on the dump. The ore is galena, with values run in silver and lead, with copper and gold. The mine has a 50 H. P. boiler and a 32 H. P. hoist. Tbe Bellingham Bay railway is surveyed through the town site, which has been laid out.

With 180 men on the payroll in all departments, the smelter is treating 800 to 1000 tons of ore daily in four furnaces, says Manager E. J. Wilson of the Northport smelter of the Le Roi No. 2 C. Co. of Rossland, B. C. The system of automatically dumping the ore into the furnaces from the cars is working economically and has reduced the crew. The supply of Crow's Nest coke keeps up.

Whitman County.

The Bucyrus Dredging Co. of Bucyrus, Ohio, will remove its dredger from Alder Creek, Mont., to the Hoodoo district, on the Palouse river, east of Palouse, and put it to work on a strip of placer ground 7 miles in length, lying along the river hottom, to which this company has ohtained title, says Manager F. M. McNeal. ——The Blue Bird quartz claim, in the lower part of the camp, will resume work. It is owned hy Iowa men as the Chickasaw M. & M. Co.

J. C. Northrup & Sons have ten quartz claims at Hoodoo which they are developing. They have driven 100 feet of tunnel on the Black Diamond claim and opened 10 feet of ore carrying $10 in free gold. The tunnel was started on the Black Diamond, hut tapped the ledge on the Apex claim.

WYOMING.

Carbon County.

Ore containing platinum in commercial quantities is reported heing produced by the New Ramhler mine, near Ramhler.

Uinta County.

There are three rigs at work in the oil field at Fossil, says the News. At the Glohe well Manager Smithers is piping the gas from the well to run his hoilers. This well is down 540 feet. The Idaho people company is still drilling, heing down 1500 feet. The short rig is also in operation.

FOREIGN.

AFRICA.

Rhodesia.

Manager T. G. Davey of the Rhodesia C. Co. reports from the Bulawayo office, under date of Nov. 4: Rhodesia Broken Hill developments progressing with satisfactory results. Work has hegun on the B'wana N'Kuha; also 140 new claims have heen pegged.

Transvaal.

The East Rand G. M. Co. reports recent borings near the properties indicate that the main reef has heen struck and will run through several of the company's farms.

AUSTRALIA.

Western Australia.

At Black Range, near Kalgoorlie, the Black Range G. M. Co. has put up a 10-stamp mill. —— Wilke, Wilkinson, Laidlaw & Denholm, owners of the Princess Alix mine, report opening up the reef, showing 2 feet wide, with values of five ounces gold per ton.

The Rohinson mine's main lode at Kanowna is being crosscut at the 500-foot level, and the whole of the 20-head stamp mill will he utilized for tho mine's own rock instead of using some of the stamps for customs work. It is the intention of the management to deepen the main shaft with a view of picking up the continuation of the Rohinson lode at vertical depth of 700 feet.

The Nullagine Conglomerate mine, at Nullagine, Pilbarra goldfield, has closed down for an indefinite period, owing to firewood supplies heing shut off. It is thought locally that unless some movement takes place at an early date in connection with building the proposed railway, from the coast to Nullagino, other mines will be compelled to suspend operations, says the W. A. Journal.

A second cyanide plant has heen built for Lambert's Treatment Co. at Sandy Creek, 20 miles from Nullagine. A large dump of tailings has accumulated and after they havo heen treated the company intend to cyanide the sands at Mosquito creek.

BRITISH COLUMBIA.

Boundary District.

Several small properties in the Boundary district have had development work started on them. Averill et al. are working the Eagle and also the Minnie, in Summit camp, near the Emma mine. C. Simpson is working the Iron Chief, adjoining the Betts & Hesperus group. W. T. Smith has started work on the Emma fraction in Summit camp. J. K. Fraser is working the Evening Star, and G. W. Rumberger is developing the King in the same camp.

G. A. Rendell, who leased the Ethiopia mine, in Long Lake camp, has men at work and shipping ore is heing taken out.

The Granby smelter at Grand Forks is in full operation, No. 5 and No. 6 stacks having heen blown in. The smelter is handling 2000 tons of ore daily. During October the output of the Granby mines was 39,398 tons, which is expected to he increased this month. The Mother Lode mine at Deadwood sent out 12,665 tons and the Snowshoe, at Greenwood, 9480 tons. A number of miners from Butte, Mont., have found work in the Boundary mines since the shutdown of the Amalgamated properties.

The Bank of England mine at Phœnix, and near the Snowshoe mine, is under lease and hond for $20,000 to W. W. Carter, who has men at work on the mine. Arrangements have heen made for a test shipment to one of the Boundary smelters.

At the Granby mines, at Phœnix, the company proposes to do away with the haulage of mine cars hy horse or mule power, and will put in two small steam locomotives. It is expected they will haul from five to seven mine cars each, and will he used in No. 1 and No. 2 tunnels of the mine. Shipments have heen increased to a 2000-ton daily rate.

Cassiar District.

D. Yule of Queen Charlotte Island reports finding mineral on the east coast, consisting of three parallel ledges respect-

ively 40, 5 and 2 feet. An annlysis shows 35% cent of zinc, with copper, silvor and gold. Yulo, with Seattlo, Wasb., men, will put in machinery for development of the property.

East Kootenay District.

The coke situation at Fernie nnd Michel is n serious one, which not only causes many temporary stoppages, but which threatens the closing down of the whole works, says the Rossland Miner. Nearly 4000 tons of coke nre piled up for shipment, and the C. P. R. is unable to handle it. Great Northern cars have been secured at Morrissey by the coal company. The smelters have been well supplied with fuel, and it is probable that they have overstocked to the extent that so far they have experienced no inconvenience.

At Windomere the Paradise mine has ceased shipping ore for this winter, but will continue development work and block out ore to be handled next spring by the tramway under construction. A sawmill is being put up to get out timber for the tramway and ore bins.——The Ptarmigan M. Co. continues development, and is opening up ore by machine drills. The aerial tramway is conveying ore from the mine to the concentrator site.——The Pretty Girl mine is shipping high-grade ore, as also the Black Diamond mine on Toby creek.

Nelson District.

The October cleanup at the Wilcox mine at Ymir nmounted to $7000, says the Spokesman-Review. From the gold saved on the plates a bar weighing 325 ounces was produced, having value of $4000. In addition, four carloads of ore and concentrates were shipped, producing net smelter returns of $5000. During October ore from the Wilcox vein was run through the mill for the first time, the mill having hitherto been supplied by the Fourth of July vein. This ore carries a larger proportion of gold to silver than does the Fourth of July ore. The control of the Broken Hill M. Co., which owns the Wilcox mine, has passed to Chicago, Ill., and Philadelphia, Pa., men, and A. H. Tuttle is secretary and local manager.——G. H. Barnhart, who has leased the Porto Rico mine from the Canadian Pacific Exploration Co., has repaired the stamp mill. He will also mill ore from the Spotted Horse group.——Wolfle & Dewault have built a 20-stamp mill for the Gold Cup mine, and ore is being sent down from the mine. Should its operation prove successful a larger plant and aerial tramway will be put up.——Hughes & Dimmick, who have leased the Ore Hill group, report making their initial cleanup with satisfactory results.——The Ymir mine is crushing good-grade ore.——With the seven producing mines in continuous operation the output from Ymir section during the winter is expected to exceed that during any previous year. The Queen and the Atlin may also resume.

Rossland District.

Arrangements have been made for building a 50-ton oil ore concentrator by the Rossland Power Co., subsidiary to the War Eagle-Center Star mines, at Rossland. The plant will be supplementary to their cyanide mill near Trail.

The oil process concentrator at the Le Roi No. 2 mine at Rossland is in full operation. The structure is on the "step-down" gravity plan, each floor being utilized for a separate stage of the process. Ore dumps of 20,000 tons supply the product to the concentrator over a surface tramway. In the initial stages the ore is reduced to 3-inch size in a jaw crusher, and then to ½-inch size in a gyratory crusher, while a rotary mill crushes it to 30-mesh fineness. The plant is in two units of twenty-five tons capacity each, with a rotary mill for each unit. Table concentrators receive the material from the rotary crushers and the first concentration is made. The material saved on the tables is collected in launders and handled in the manner common to all systems of concentration. The residue from the tables is conducted to sets of horizontal iron tanks, fed with refuse petroleum from 2000-gallon oil tanks. The horizontal tanks (mixers) are arranged in sets of three, one above the other. Each drum is revolved slowly by a spiral shaft and the oil picks up the mineral. At the end of the upper tank a quantity of oil carrying minoral is delivered, while the balance of the contents of the first drum passes into the second drum, and thence to the third, the last drum collecting such mineral as remains. The oil bearing material passes into a centrifugal separator, revolving at 1000 revolutions per minute, the effect of which is to throw out the oil. This does not recover all of the oil, however, and a further recovery is made in a perforated separator, also a centrifugal. From the perforated separator the concentrates are drawn ready for shipment, while the oil is returned to the tanks for further use. Such oil as remains in the concentrated product is valuable as a binder in the briquetting process at the smelter. Arrangements will be made for steel cars to ship the concentrates in bulk. Five men, per 12-hour shift, are required at the works. The machinery operates continuously, the system working automatically.

Slocan District.

During the year 1800 tons of zinc ore have been shipped from the Slocan to Kansas. There are, says the Ledge, 2500 tons ready for shipment, which will be sent out before February. This supply will be principally drawn from the Payne, Ruth, Ivanhoe and Wakefield, near Sandon. If advisable, the Slocan mines could, it is claimed, ship 15,000 tons of zinc ore yearly. The Wakefield sold 200 tons during the last week of October which ran 45% zinc, 30 ounces in silver and 4% lead. The magnetic separator is in operation at the Payne, which enables that mine to send out a product running 55% zinc, 16 ounces silver and a trace in lead. The process at the Payne separates the iron from the zinc.

Vancouver Island.

The Lenora mine at Mount Sicker, in Victoria district, is shipping 100 tons a day from material which was formerly considered not worth treatment, and has been used as filling. This has been found to carry gold, so that though the copper values are low the general return on the ore is sufficient to give profit at the smelter. On the Tregear vein work is progressing. A shaft is being sunk which is in ore, giving average values of 15%, says Manager Tregear. He is also preparing to do further work in some of the old workings which are being pumped out.

West Kootenay District.

The completion of the concentrator at Five-Mile will permit the Silver Cup and Nettie L. mines near Ferguson, in the Lardeau, to reduce the shipping bulk of their ore from 30 to 1.

Near Ferguson, Manager Forbes has closed down work at the Nettie L. mine, on instructions from the London office, as the company desires to hold all shipments until completion of the combination 20-stamp silver mill, which is being built jointly by the Nettie L. M. Co. and the Silver Cup M. Co. It is expected to be ready for operation by March 1st. There are ninety men employed on the construction of the mill. At the Silver Cup fifty men are employed.

CANADA.

Ontario.

Toronto reports say nickel has been found along the line of the Government's Temiskaming Railway. Some of the deposits run up to 24% nickel. The Government has reserved a strip of land along the railway, taking in the newly found deposits.

CUBA.

The province of Santiago de Cuba contains the principal commercially producing mines of iron and manganese, says the report of the Division of Mining and Mineral Resources. Copper is produced in small quantities in Santiago de Cuba, Puerto Principe and Mantanzas. Asphalt is produced on a commercial scale in four provinces — Habana, Mantanzas, Santa Clara and Puerto Principe.

MEXICO.

Chihuahua.

H. T. Cowell, manager of the Barranca del Cobre copper mines of Chihuahua, says he is preparing to build a sulphuric acid leaching plant at this mine. The plant will have a capacity of treating fifty tons of tailings daily.

T. H. Oxnam of Los Angeles, Cal., manager of the Palmarejo & Mexican Gold Fields, Ltd., at Palmarejo, Western Chihuahua, reports work progressing. The cyanide slimes and concentrates are sold at the mine monthly to the National Metal Co., and the former are shipped out via Chihuahua and the latter via Agabampo on the west coast. A slimes plant will be put in to treat slimes that the present system does not save. The Oxnam Prospecting Co. has unwatered the Todos Santos mine and a development shaft is being sunk. Pumping machinery has been set up to unwater the Gueraltirino mine.

The Parral M. Co. has its mill at Parral in full operation. Ore has been blocked out.

The Americana mine at Terrazas which is worked by the Cia. Metalurgica de Torreon, S. A., reports 3000 tons of ore stacked up at Terrazas station last week waiting for cars to move it. The question of draining the caves of the large body of seepage water is under consideration, and plans are being drawn for a pumping plant of 1000 gallons per minute capacity. Development work is kept ahead of ore extraction.

Coahuila.

The Monterey News says the San Carlos C. Co. will start work soon on its railroad from Linares to its mines.

Elgin & Murphy, who bought the Salvador and Porvenir mines, near Las Esperanzas coal mine at Barroteran, will put in machinery and the work of building a concentrator began last week.

Durango.

G. W. Milne of London, England, reports buying the Watterson mine, for $600,000, for his company.

Durango reports negotiations under way for the sale of the Reyos mine, near Santiago Papasquiaro, owned by E. R. Arnolds and H. Lozayo, to St. Louis, Mo., men; also that an offer of $30,000 has been made for the Providence mine, in the same section, by the Wilson Co. of Cincinnati, Ohio.

Oaxaca.

S. Compton et al. of Kansas City, Mo., are forming a company to take over and work the El Resurreccion group of five mines, near Tlacolula, in the Tlacolula valley. A branch railroad is being built from Oaxaca to Tlacolula, a distance of 35 miles.

The extension of the Oaxaca-Ocotlan Railroad, owned by G. Teruel of Mexico City, is reported completed half way from Ocotlan to Ejutla, in the gold fields.

Sonora.

R. Gayou, superintendent of the silver mines at Planchas de Plata, reports in the Ladera tunnel a body of high-grade silver ore has been cut which mills 200 ounces silver per ton. The mill is in full operation.

G. Spindle and A. R. English, part owners of the Guadalupe gold-bearing group, south of Cananea, report organizing the Pittsburg & Sonora M. Co., to develop the ground. The ore is low grade and a mill will be built to handle it.

The Arizona & Mexico G. M. Co. has been organized at Phœnix, Ariz., with the following directors: F. W. Sheridan, R. Toohey, J. Cope, C. Pompa and J. Ackle. F. W. Sheridan of Cananea is secretary and manager. Their holdings are gold claims in the Quitaca gold belt, 30 miles west of Cananea. They will sink 250 feet on the main ledge.

RUSSIA.

The Gazette de St. Petersburg says in accordance with the law recently put in force, no foreign subjects can either exploit themselves or participate in the exploitation of the gold beds situated in a zone 100 versts (66 miles) broad from the whole length of the Pacific coast in Russian territory, as also on the island of Saghalien and neighboring islands.

SPAIN.

Huelva reports that the efforts of the Prefect have failed to settle the strike at the Rio Tinto mines, which has been in progress three weeks, the manager refusing to comply with the demands of the strikers. About 1500 miners at Penahierra, near Rio Tinto, have struck in sympathy with the Rio Tinto strikers. At Santander there is little change in the strike situation. The troops are patrolling the streets.

TASMANIA.

Ore smelting in No. 2 plant of the Mount Lyell Co. has been continued since the middle of November, 1902, without the use of coke (but with heated blast, although of a lower temperature than that formerly used), and at No. 1 plant both ore and matte have been smelted without the use of the hot blast (but with the former addition of a small percentage of coke). These innovations have been attended with no trouble whatsoever, and may now be considered permanently established, the results being favorable and tending towards an increase of furnace capacity. They effect a considerable annual saving, and it is expected that still further improvements and economies will be achievable in the course of time. Four furnaces are now doing the work formerly done by five, three of the four being constantly on ore, and the fourth concentrating the first matte into converter matte. The treatment costs for the company's half year ended Sept. 30, 1902, were as follows: Mining, 2s 1.01d; removal of overburden, 2s 1d; smelting, 14s 0.24d; converting, 1s 6.06d; total, 19s 8.31d. During the half year mentioned there were treated 159,450 tons of Mount Lyell ore of an average value of: Copper, 2.36%; silver, 2.23 ounces, and gold, 0.069 ounce, together with 18,537 tons of metal-bearing fluxes, of an average assay value of: copper, 1.70%; silver, 0.24 ounce, and gold, 0.026 ounce, and 5689 tons of purchased ores, making the grand total for the half year 183,676 tons, and raising the grand total since the beginning to 1,532,306 tons of ore.

Personal.

J. M. COLLINS of Nome, Alaskn, is in San Francisco, Cal.

F. C. HELM, interested in Alaska mines, is in San Francisco, Cal.

C. J. CAUGHEY of Salt Lake City, Utah, of the Majestic C. Co. is in the East.

R. E. GLASS of the Big Four Co. is in Chicago, Ill., from Deadwood, S. Dak.

L. H. ALLEN of Kansas City, Mo., is in San Francisco, Cal., on mining business.

I. COPELAND is in San Francisco, Cal., from Sierra Co., Cal., on mining business.

H. CALLAHAN of San Francisco, Cal., returned this week from an extended Eastern trip.

H. H. NICHOLSON, of Lincoln, Neb., is examining mining property in Boulder county, Colo.

H. L. MEACHAM is superintendent Friday Gulch G. M. Co. at Havilah, Kern county, Cal.

G. W. MIDDLETON of Prescott, Ariz., returned there last week from a trip East on mining business.

H. FRANKLIN of the Golden Reward mine is in New York City from Deadwood, S. Dak., on business.

P. MCPHERSON of Park City, Utah, is manager of the Keith O'Brien M. Co. of Salt Lake City, Utah.

FRED DUNHAM, formerly of Deadwood, S. Dak., is visiting at Sturgis, S. Dak., from Nome City, Alaska.

N. CLERE is superintendent of the San Jose mine, in Moctezuma district, near Nacozari, Sonora, Mexico.

A. N. BUTTS is superintendent of the Empire mine at Gold Valley, near Downieville, Sierra county, Cal.

R. A. LEWIS of New York, of the Green Con. C. Co. of Cananea, Sonora, Mexico, is in San Francisco, Cal.

E. D. R. THOMPSON, mining lawyer and operator of Salt Lake City, Utah, is in New York on mining business.

J. B. TOMLINSON, manager of the Yeager Canyon M. Co., near Prescott, Ariz., is in Denver, Colo., on business.

W. F. LANIGAN has resigned as assistant manager of the Royal Con. M. Co. at Hodson, Cal., and has gone East.

A. J. UNDERWOOD of Salt Lake City, Utah, is manager of the Lluvia de Oro mine near Urique, Chihuahua, Mexico.

G. R. RYALL of Baltimore, Md., of the Hays Con. M., M. & L. Co., operating in Sonora, Mexico, is visiting their mines.

REESE LLEWELLYN, president and manager of the Llewellyn Iron Works, Los Angeles, Cal., is in San Francisco, Cal.

B. C. COOK has resigned as metallurgist for the Lexington Hill G. M. Co., and will go to Mexico to conduct a cyanide plant.

W. F. SNYDER of Salt Lake City, Utah, interested in the Balaklala copper mine in Shasta county, Cal., is in San Francisco, Cal.

A. S. GOODELL has resigned as manager of the Montreal & Boston C. Co.'s smelter at Boundary Falls, B. C., and is in Spokane, Wash.

H. HAAS is smelter superintendent at the Afterthought copper mine of the Great Western G. Co., near Bella Vista, Shasta county, Cal.

R. H. BINNS, treasurer of the Horseshoe M. Co., has returned to Pittsburg, Pa., from a trip to the company's mines in the Black Hills, S. Dak.

M. J. SCHNEIDER of Monterey, Nuevo Leon, Mex., is manager of the San Pablo and San Antonio mines of the J. W. Leedom estate, near Santa Catarina, Nuevo Leon.

D. G. JEWETT has returned to Los Angeles, Cal., from Berry Creek, Butte Co., Cal., where he has been examining mining properties for J. H. Rowand of Helena, Mont.

E. B. BRADEN of Helena, Mont., manager of the Great Falls and the East Helena smelters of the American S. & R. Co., is also manager of the smelter at Everett, Wash.

L. W. HAGGERTY, recently of Amador City, Cal., is superintendent of the Nevills mining properties, near Jamestown, Tuolumne Co., Cal. (including the App and Rawhide mines), vice W. L. Turner, resigned.

Obituary.

J. WEAVER, a pioneer miner of Boise county, Idaho, aged 75, died at Boise on the 14th inst. He went to Pioneerville, Idaho, from Baltimere, Md., in 1865.

J. B. CLEMMONS, a Colorado mining man of the San Juan section, died on the 11th inst. at Denver, Colo. Deceased was superintendent of the Bachelor mine. He leaves a wife and three children.

B. T. RIGGS, a pioneer of Arizona and one of the original owners of the Hillside mine in western Yavapai county, Ariz., died at his home in San Diego, Cal., on the 10th inst., after a long period of failing health.

G. W. HOFFMAN, a pioneer miner and merchant of California, died at San Jose, Cal., on the 21st inst., aged 78 years. He went to California in 1852 and engagod in mining in Shasta county. He is survived by three sens.

M. GARVER, a pioneer mining man and mechanical engineer, and a former State Assemblyman from Nevada county, Cal., died at Nevada Clty, Cal., on the 19th inst. Deceased was a native of Ohio, aged 79 years. He was a veteran of the Mexican war and went to California in 1852.

A. F. MILLER, a pioneer miner of Silver City, Owyhee Co., Idaho, died at Silver City on the 11th inst. Deceased was 80 years of age, a German, and served as an engineer in the Russian navy during the Crimean war. He formerly owned the Calaveras mine, near Silver City, Idaho.

A. DOTEN, a pioneer miner of Nevada and California, died at Carson, Nev., on the 13th inst. Deceased was a native of Plymouth, Mass., born July, 1829. He went to California in 1849, and engaged in placer mining, going to Como, Nev., in 1863. He is survived by a wife, daughter and two sons.

S. H. EDWARDS, a pioneer miner of Oregon and California, died at Eugene, Or., on the 15th inst., after an illness of several months. The deceased was born in Monmouth county, N. J., in 1824, and in 1849 went to the California gold fields, following mining until 1856, when he went to Oregon.

J. H. CROCHERON, a pioneer miner of Oregon, California and Idaho, died at Mountainhome, Idaho, on the 19th inst. Deceased was born in New York City, April, 1828. In 1849 he left New York for California via Cape Horn. He mined in several districts in California and Oregon, as well as one season in Cariboo, B. C. He went to Silver City, Idaho, in 1867. He is survived by a widow and one son.

CHARLES MCCORMICK, superintendent of the Vindicater mine, at Cripple Creek, Colo., and M. H. Beck, mine foreman, were killed on the 21st inst. by an explosion in the sixth level of the Vindicator mine. The explosion occurred while McCormick and Beck were descending into the mine on the cage. They were the only passengers. As the cage reached the sixth level the explosion occurred, wrecking the level, cage and shaft at that point and instantly killing both men. It is asserted by officers of the Vindicator M. Co. that the explosion was caused by a trap. This statement was made after a thorough examination had been made of the shaft. The trap, containing dynamite, was placed in the sixth level, which is part of the abandoned workings of the mine, within a few inches of the shaft. Then a loaded revolver was fixed in the shaft with its barrel pointing directly toward the box of dynamite. To the triggor of the revolver was attached a string, which was thrown across the shaft in such a manner that when the cage came down and encountered the string the revolver would explode, the bullet striking the dynamite. Piecos of this revolvor have been recovered from the bottom of the shaft. A detail of soldiers were sent from Camp Goldfield to the mine and took charge of the property. Several miners charged with being implicated in the murder have been arrested.

Commercial Paragraphs.

A. R. PARTRIDGE of San Francisco, Cal., is in Lassen county, Cal., putting up a centrifugal impact pulverizer for the Hayden Hill M. Co.

THE Llewellyn Iron Works, Los Angeles, Cal., reports closing contract for a 10-stamp mill for the B. E. Chase G. M. Co. at Stagg, Cal.

THE Calkins Co. of Los Angeles, Cal., manufacturers of assayers' and laboratory supplies, has been reorganized, with Chas. Wier of San Francisco, Cal., as president. They are arranging for establishing branch works in San Francisco.

THE Crocker-Wheeler Co., of Ampere, N. J., has established headquarters for the Southern representative of its Washington office at 425 Empire building, Atlanta, Ga. Mr. S. M. Conant, of the company's selling forces, will be in charge.

THE Brown-Corliss Engine Co. of Corliss, Wis., have added a full line of sawmill machinery and have opened a special department in that line in the Wells Building, Milwaukee, Wis., in charge of Theo. S. Wilkin. The company is now contracting with a foreign corporation to carry a line of blast furnace gas engines. These lines are to be carried on in connection with their Corliss engine and rolling mill work.

THE Circuit Court for Wayne county, State of Michigan, issued an injunction on Nov. 17th in favor of the Detroit Lubricator Co., and against the Michigan Lubricator Co., restraining them from using the words "Detroit Lubricators," "Improved Standard Lubricators," "Detroit Improved Standard Lubricators," in connection with their lubricators or advertising matter; also restraining them from using boxes or packages for their lubricators bearing the words "Detroit," or "Detroit, Mich.," unless their firm name be also given. It is alleged that for some time past the Michigan Lubricator Co. has been making lubricators resembling these made by the Detroit Lubricator Co. in outward appearanco, and stamped on these lubricators and on the boxes containing them are only the words, "Detroit, Mich.," making no mention of their firm name. To protect their customers from being deceived the Detroit Lubricator Co. secured this injunction.

Catalogues Received.

The Blackmer rotary pump is the subject of a brochure issued by the Detroit Pump Co., Hammond Bldg., Detroit, Mich.

Cable lines and automatic telpher plants are the subjects of catalogues 37 and 38, from the United Telpherage Co., 20–22 Broad St., New York City.

Bulletin No. 39, from the Crocker-Wheeler Co., Ampere, N. J., describes a particularly interesting electrical equipment at the Orange Brewery, Orange, N. J.

The Gunckel patent cable haulage system is the subject of an illustrated catalogue describing it in detail and issued by the Macomber & Whyte Rope Co., 19–21 South Canal St., Chicago, Ill.

The Mecklenburg Iron Works, Charlotte, N. C., send a standard size description of their various makes of mining machinery and a description of the Thies chlorination precess.

"Graphite Suggestions," from the Jos. Dixon Crucible Co., Jersey City, N. J., is a dainty portrayal of the value afforded in a variety of industrial ways by the graphite they furnish in such multifarious forms.

"Labor Saving Tools, Operated by Compressed Air," is a fine 32-page portrayal of economical devices supplied by the pneumatic tool department of the Ingersoll-Sergeant Drill Co., 26 Cortlandt street, New York City, N. Y.

Latest Market Reports.

SAN FRANCISCO, November 27, 1903.

METALS.

SILVER.—Per oz., Troy: London, 27½d (standard ounce, 925 fine); New York, bar silver, 57¾c, refined (1000 fine): San Francisco, 57¾c; Mexican dollars, 46@47½c San Francisco, 44½c New York.

Silver remains practically unchanged since last week's quotations.

COPPER.—New York: Standard, $12.50; Lake, 1 to 3 casks, $12.50; Electrolytic, 1 to 3 casks, $12.50; Casting, 1 to 3 casks, $12.50; San Francisco: $15.00. Mill copper plates, $17.00; bars, 18@24c. London: £54 15d spot per ton.

A slight falling off in copper is noticeable, the strong buying movement held in anticipation having not materialized as yet.

LEAD.—New York, $4.25; Salt Lake City, $3.50; St. Louis, $4.00; San Francisco, $4.50, carload lots; 4¾c 1000 to 4000 lbs.; pipe 6½, sheet 7, bar 5¾c: pig, $4.75. London: £11 ₱ long ton.

SPELTER.—New York, $5.75; St. Louis, $5.10; London, £21 ₱ ton; San Francisco, ton lots, 6¾c; 100-lb. lots, 7c.

TIN.—New York, pig, $25.25 @ 25.50; San Francisco, ton lots, 27c; 500 lbs., 28c; 200 lbs., 28c; less, 28½c; bar tin, ₱ lb., 30@32c. London, £116.

PLATINUM. — San Francisco, crude, $18.00 ₱ oz.; New York, ingot, $19.00 ₱ Troy oz. Platinum ware, 75 @ 80c ₱ gram.

QUICKSILVER. — New York, $46.00@47.00, large lots; London, £8 7s 6d; San Francisco, local, $43.50@44 ₱ flask of 76½ lbs.; Denver, $49.50. Export, $42.50@43.00.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 35c; Eclipse, 37½c.

SOLDER. — Half-and-half, 100-lb. lots, 18.00c; San Francisco, Plumbers', 100-lb. lots, 15.25c.

ZINC.—Metallic, chemically pure, ₱ lb., 50c; dust, ₱ lb., 10c; sulphate, ₱ lb., .04c.

NICKEL.—New York, 50@60c ₱ lb.; ton lots, 40@47c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30@34c.

ANTIMONY. — New York, Cookson's, 7½c; Hallett's, 6¾c; San Francisco, 1000-lb. lots, 8c; 300@500-lbs., 8½c; 100-lb. lots, 10½c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, $15.85 @16.10; gray forge, $13.50; San Francisco, bar, 3c ₱ lb., 3½c in small quantities.

STEEL. — Bessemer billets, Pittsburg, $23.00@25.00; open hearth billets, $23.00 @26.00; San Francisco, bar, 7c to 12c ₱ lb.

S., bbl., 85c; cs., 90c; Neats-foot Oil, pure, bbl., 75c; cs., 80c; Sperm, crudo, 50@55c; Natural White, 70c; Bleached, do., 75c; Whale Oil, cs., 50@55c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2.00 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Triple tape, $3.60 per 1000 feet; double tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11½c ₱ set; 14 oz., 40s., 10c.

CHEMICALS. — Cyanide of potassium, 98%–99%, jobbing, 23@24c ₱ lb.; carloads, 23@23½c; in tins, 30c; soda ash, $2.00 ₱ 100 lbs.; hyposulphite of soda, 3@3½c per lb.; caustic soda, in drums, 3@3½c ₱ lb.; Cal. s. soda, bbls., $1.20@1.40 ₱ 100 lbs.; sks., $1.05; chlorate of potash, 12@13c; nitrate of potash, bbls., 10c; caustic potash, 10c in 40-lb. tins; roll sulphur, 2½@2¾c; powdered sulphur, 2@3c; flour sulphur, French, 3½@3¾c; alum, $2.00@2.25; California refined, 1¾@2c; sulphide of iron, 8c ₱ lb.; copper sulphate, 5¼@5¾c; chloride of lime, spot, $2.50@2.75; sulphuric acid, in carboys, 66% B, 1¾@2c ₱ lb.; nitric acid, carboys, 8c ₱ lb.

BONE ASH.—Extra No. 1, 5@6c ₱ lb. No. 1, 4@5c.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 6½c; less than 500 lbs., per lb., 7c; in 25-lb. tin pails, ½c ₱ lb. above keg price; in 1 and 5-lb tin cans, 100 lbs. per case, ½c. per lb. above keg price. Dry Lead—In bbls., 1 ton and over, 6½c; do. in kegs, 7c.

RED LEAD.—500 lbs. and over at one purchase, ₱ lb., 6½c; less than 500 lbs., 7c.

LITHARGE.—Pure, in 25-lb. bags, 8@9c ₱ lb.

BORAX.—Concentrated, 6@7c ₱ lb; powdered, 8@10c; fused, 20@25c; crystal, 7c; calcined, 25c.

MANGANESE.—Pure, ₱ lb., 60c.

SODIUM.—Metal, ₱ lb., $1.00.

BISMUTH.—Subnitrate, ₱ lb., $1.75.

MERCURY.—Bichloride, ₱ lb., 90c.

MOLYBDENUM.—$2.00 ₱ lb.

CHROMIUM.—90% and over, ₱ lb., $1.00.

PHOSPHORUS.—American, ₱ lb., 75c.

SILVER.—Chlorido, ₱ oz., 90c@$1.00; nitrate, 55c.

ALUMINUM.—No. 1., 99%, small lots, 37c ₱ lb.; 100 lbs., 35c; 1000 lbs, 34c; ton lots and over, 33c, Pittsburg. No. 2, 90%, small lots, 34c; ton lots and over, 31c, Pittsburg.

URANIUM.—Oxide, ₱ lb., $3.50.

(These prices aro wholesale, f. o. b. San Francisco, unless otherwise notod.)

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific Coast inventors:

FOR THE WEEK ENDING NOVEMBER 17, 1903.

744,271.—WRENCH—J. H. Adams, Fullerton, Cal.
744,272.—PUMP—R. Addison, Pasadena, Cal.
744,159.—SWITCH TURNER—L. L. Bigelow, Seattle, Wash.
744,029.—GOPHER TRAP—C. H. Birdsall, Corona, Cal.
744,288.—WATER ELEVATOR—J. L. Brown, Los Angeles, Cal.
744,163.—CONVEYOR—J. A. Brown, Portland, Or.
744,474.—PENCIL—A. E. Buckingham, Oakland, Cal.
744,289.—RAILROAD SWITCH—G. C. Calentine, Tacoma, Wash.
744,047.—PAPER HOLDER—E. D. Casterline, Los Angeles, Cal.
744,048.—CAN FILLING MACHINE—A. Cerruti, S. F.
744,049.—CAN FILLING MACHINE—A. Cerrutti, S. F.
744,490.—EXCAVATOR—W. Cole, S. F.
744,491.—EXCAVATOR—W. Cole, S. F.
744,168.—SWITCH—J. M. Comer, Spokane, Wash.
744,494.—PRESSURE REGULATOR—E. R. Cook, Sacramento, Cal.
744,297.—GAS REGULATOR—E. R. Cook, Sacramento, Cal.
744,497.—TELEPHONE—H. L. Cutter, Los Angeles, Cal.
744,305.—SMELTER—Daniels & Clark, Nogales, Ariz.
744,502.—PLAYING CARDS—H. S. Delamere, Ferndale, Cal.
744,508.—HAY PRESS—J. M. Dolan, Livermore, Cal.
744,516.—GRAIN CLEANER RIDDLE—E. Early, Lathrop, Cal.
744,181.—POTATO PLANTER—G. H. Elmer, Pleasant Valley, Or.
744,322.—CONCENTRATING—A. D. Foote, Grass Valley, Cal.
744,326.—CARD DISPLAY DEVICE—R. B. Friend, Oakland, Cal.
744,528.—GAS BURNER—W. Ghiglieri, Stockton, Cal.
744,192.—SCALE—F. W. Grey, Los Angeles, Cal.
744,337.—TELEPHONE MOUTHPIECE—Griffin, Sanker & Keith, Riverside, Cal.
744,703.—DREDGER—M. C. Harris, S. F.
744,541.—PAVING—J. Heenan, Portland, Or.
744,551.—LOCOMOTIVES—C. Houston, Benson, Ariz.
744,078.—SHOE SOLE STRETCHER—C. R. Johnston, Eureka, Cal.
744,370.—BATHING APPARATUS—L. V. Levinger, S. F.
744,214.—GATE VALVE—L. P. Lowe, S. F.
744,220.—FUEL BURNER—A. Neu, Colton, Cal.
744,387.—REFLECTOR—D. J. O'Brien, S. F.
744,602.—PHOTO DEVELOPING APPARATUS—E. E. Park, S. F.
744,229.—CONCENTRATOR—J. W. Pinder, S. F.
744,406.—ROPE CLIP—B. C. Riblet, Spokane, Wash.
744,614.—ROTARY ENGINE—M. A. Rice, Los Angeles, Cal.
744,693.—MATCH SPLINT MACHINE—W. Scharnweber, Seattle, Wash.
744,119.—PAPER HOLDER—A. E. Sexton, Los Angeles, Cal.
744,418.—ENGINE MUFFLER—R. C. Sheperd, Los Angeles, Cal.
747,250.—BOILER FEEDER—F. W. & H. L. Shupert, Spokane, Wash.
744,636.—DREDGER BEARINGS—P. Small, Oroville, Cal.
744,264.—ORE FEEDER—L. R. Tullock, Angels Camp, Cal.
744,447.—ROTARY ENGINE—E. S. Ward, San Jose, Cal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

RIDDLES FOR GRAIN CLEANERS. — No. 744,516. Nov. 17, 1903. E. Early, Lathrop, Cal. This invention consists in the combination in a grain-cleaning device of a riddle consisting of side frames, transverse plates or surfaces extending between said frames, each successive plate being located below and in advance of the front edge of the preceding one, having upturned rear edges and inclining downwardly therefrom. Wire pins project from the front edges over the intermediate spaces and above the succeeding plates, said wires being alternately bent upward and downward so as to provide an increasing distance between them from the base to the discharge ends, and there are means for delivering material to be separated upon the uppermost of said plates.

CARD DISPLAY DEVICE.—No. 744,326. Nov. 17, 1903. R. B. Friend, Oakland, Cal. This invention consists of hollow supports with hinge pins adapted to receive the hinges of independent card or notice holders, which project horizontally outward and are turnable about these pins, said holders having suitable means for readily attaching or detaching the required cards or notices. The pins and hinges are so arranged that the card-holders may stand in line, or either one of them may be turned out of line and detached and removed. The device may be used in real estate and other like offices where it is desirable to display cards or notices of real estate for sale or other matter in an attractive form in the windows, or upon desks or counters convenient for the inspection of customers.

PROCESS OF PREPARING CONCENTRATING SURFACE. — No. 744,322. Nov. 17, 1903. A. De Wint Foote, Grass Valley, Cal. This invention consists of a process of preparing a surface for concentrating and collecting the mineral contents of tailings or wastes from mills or factories; and it consists in commingling petroleum and lime and spreading the same evenly over the surface of a concentrator.

PENCIL.—No. 744,474. Nov. 17, 1903. A. E. Buckingham, East Oakland, Cal. Three-fourths assigned to Frank Tindell, F. Klingeberg and G. F. Foye, of Oakland, Cal. This invention relates to pencils of that class having a wooden body and an interior graphite or other marking substance. It consists in constructing the wooden outer body with an axial interior hole having a slight curve from end to end, so that the graphite or other marking body will be made to conform to this curve, and thus bind sufficiently within the tube to prevent its being moved by ordinary pressure upon the point. An open slot is made in the side of the outer body and a sleeve surrounding and slidable upon this body has an inwardly projecting spur or arm, which may be either free or connected with the rear end of the marking substance, and by which the latter may be advanced as the point is worn away.

PHOTOGRAPHIC DEVELOPING APPARATUS.—No. 744,602. Nov. 17, 1903. E. E. Park, San Francisco, Cal. This invention consists of one or more hinged or tilting plates dipping into the trays containing the developing solution so as to lie beneath the plates which are being developed, means for alternately raising and lowering the plates so as to agitate the developing liquid and also to serve to rinse the plate out of the liquid when it is desired to remove them, and means by which said tilting plate or plates may be actuated.

WANTED.

WANTED--Agents in Different Parts of the United States to Handle Our Output.

For information, apply to BROWN CORLISS ENGINE CO., Corliss, Wis.

RAW OR PYRITIC SMELTING FOR COPPER, GOLD AND SILVER ORES.

The undersigned wishes a commission to design and operate a plant based upon the above process, for some good company. Special methods for separating gold and silver from matte.

FRANKLIN R. CARPENTER, Ph.D.
1420 Josephine Street, Denver, Colorado.

HELP WANTED.

WANTED—PRACTICAL PLACER MINER, one who speaks Spanish preferred; must be familiar with and able to direct general construction work, blacksmithing, etc. Pay moderate salary and found. Mines are in Colombia, S. A., 3500 feet altitude and accessible. State references and salary expected. Address W. J. BREWSTER, President, Fort Madison, Iowa.

WRITE TO US
FOR COMPETENT
TECHNICAL MEN
For all classes of work. FIVE THOUSAND POSITIONS FILLED IN TEN YEARS.
ENGINEERING AGENCY,
210 Monadnock Block, CHICAGO.

SITUATIONS WANTED.

A COMPETENT MILLMAN OF 10 YEARS' experience would like to take charge of a mill in any part of the country, understanding cyaniding thoroughly. Wife would like to take charge of boarding house at same place. Address W. G., care of Mining and Scientific Press.

CYANIDE CHEMIST, WHO HAS SUCCESSfully handled cyanide plants, is open for engagement in December. Address A.B.C., this office.

ENGINEER DESIRES POSITION AS SUPERintendent of mining. Best experience obtained in Idaho, Butte, Utah and Colorado. Excellent references. Address T. Worth Bowen, Butte, Mont.

EXPERIENCED MILLMAN WISHES POSItion. Address Box 202, Enterprise, Cal.

EXPERIENCED ACCOUNTANT AND BUSIness Manager, with best of references and accustomed to modern methods of mine cost accounting, etc., desires position with reliable mining company. Address "Business," care of this office.

MECHANICAL ENGINEER, TECHNICAL graduate, desires responsible position with gold dredging company. Ten years' experience as manager, constructing and consulting engineer gold dredges. Special experience saving fine gold. Can design and build complete plants. Will take position opening new ground or with going company. Address "Dredging," care of Mining and Scientific Press.

MINING ENGINEER AND METALLURGIST, with sixteen years of practical experience as superintendent, manager and consulting engineer of mines and mills, desires position on or after January 1st. Speaks Spanish fluently. Address P. O. Box 77, Durango, Mex.

MINING ENGINEER OF GOOD STANDING, with twelve years' experience in mines and mills, wants position as expert. School of Mines graduate. Address V. X., this office.

POSITION WANTED BY NEW YORK ELECtrical engineer with Pacific Coast company. Experienced in construction work and selling. A position where he can work into the selling end preferred. References from company with which he is now connected. Address G. P., this office.

PRACTICAL EXPERIENCE IN METAL MINing, installing and operating steam hoilers, engines and mining machinery, together with a thorough course in mining engineering at the Scranton schools, enables me to be thoroughly competent to take hold of a new property and develop it by the latest scientific mode of mining to a paying basis. Can furnish A1 reference. Open for engagement after January 1st, 1904. THEO. T. SWIFT, Muskegon, Mich. Lock Box 113.

SOBER YOUNG MAN DESIRES POSITION AS Mill Man. Has had six years' practical experience in amalgamating and concentrating, and a fair knowledge of the operation of engines. Will give best of references upon application. Address C. L. B., care this office.

SUPERINTENDENT IS OPEN FOR POSITION to develop gold or copper properties; experienced miner; can make underground maps and models, also do the assaying; speaks Spanish; good references from past companies. Address "Develop," care this office.

SUPERINTENDENT, COMPETENT ASSAYER, Chemist and Surveyor. Special experience in development work; free or base ores; millman. Equipment complete. Address "Seattle," this office.

SUPERINTENDENT WANTS POSITION WITH substantial company. Practical miner, millman, assayer and cyanide expert. Address Supt., this office.

WANTED—POSITION AS SUPERINTENDENT or assistant of copper mines and smelters; competent all round man, good assayer, analyst and draughtsman; can handle labor; speaks Spanish. Address "Smelter," care this office.

WANTED BY AN EXPERIENCED MINING Engineer and Manager, a position as mine manager in gold, silver or copper proposition, with a first-class corporation. Have had 25 years' experience in U. S. and Mexico; prefer Mexico. Speak Spanish, German, French and English. Am well acquainted with Mexico, and am employed now. Desire a change between November and January 1st, 1904. Salary expected not less than $5000 per annum. Can furnish the best of reference. Address "Mine Manager," care of Mining and Scientific Press, San Francisco, Cal.

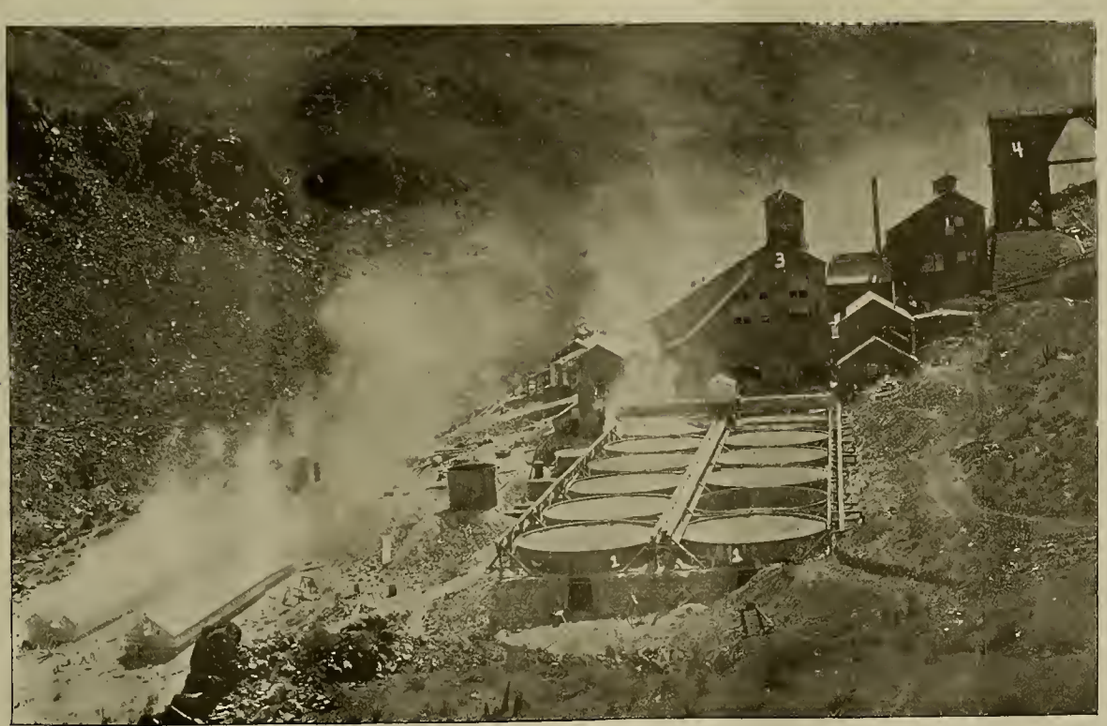
Ore Handling.

In these days of modern mining methods, and large operations, the problem of economical handling of great quantities of ore is receiving constantly increasing attention. The various systems of open cut and underground mining, as far as breaking rock is concerned, are usually well understood and in general use, but the handling of this broken ore is another proposition. Undoubtedly the cheapest mining that can be done is by the open-cut system, where the rock broken in the sloping sides of the cut passes downward by gravity through mill holes to underground chutes, where it is drawn out into cars and trammed through a tunnel to the mill or smelter for treatment, or to the railroad for shipment. This system is recognized as the most economical, but it is not always applicable, owing to the topographical situation. At some mines where this method has been in vogue it has from necessity either been abandoned or modified, by the ore having been worked out to the tunnel level. In that event it is the best practice to sink a shaft to a level below the bottom of the cut, connect it with the ore body by drift or crosscut, raise to the bottom of the original open cut and continue to mine as before, hoisting to the surface through the shaft. This is the practice at the Alaska-Treadwell mine on Douglas Island.

Traveling Bridge Over Cyanide Vats, Kofa, Ariz. (See Page 367.)

In the Lake Superior iron ranges the method of mining is largely by the open-cut system, but the cuts are of such large superficial area, and the topography of the greater portion of the region is so flat, that the mill-hole system is not generally adopted, though it is in use in some of the largest mines. In the greater number of mines the steam shovel is an important factor in handling both the overburden and the underlying ore. Recently the steam shovel has been introduced into gold and copper mines of British Columbia, and its successful application to the open-cut system of mining there has determined the management of the Granby mines at Phœnix to try the shovel in underground mining.

Where the distance from mine to mill is considerable, with a very material difference in elevation between the two points, the aerial tramway has proven an economical method of ore handling. Where the distance between mine and mill is great, with no considerable difference in elevation, cars in train drawn by a motor of some description, on a crooked road or by rope haulage, if the line be fairly straight, afford an economical means of moving ore from place to place. At the docks on the Great Lakes, where millions of tons of iron ore are loaded and unloaded annually, the traveling steel cranes are a feature in ore handling not yet introduced into other branches of metal-ore handling.



This method of handling ore is particularly adapted to cases where ore is loaded from cars, or from accumulated piles into ships, or vice versa. In a few instances ore is handled by means of large buckets, which are lowered from a rigid rope extending horizontally over an open cut, the bucket when filled being hoisted vertically to near the ropeway and then carried along it horizontally to some point beyond the rim of the cut and dumped. This method, while mechanically successful, is not as economical as when the ore can be handled by gravity.

The aim is constantly to introduce mechanical devices which will lessen or do away with manual labor to as great an extent as possible. In this field electricity is entering more prominently every day, and electrically operated cranes, hoists and motors and other classes of mining machinery are coming into more common use about mining and metallurgical plants.

The wheelbarrow as a factor in ore handling is almost obsolete, for it has been found economy to lay tracks and employ cars on even so transitory a proposition as grading for buildings.

In large mines underground mechanical haulage is no longer an experiment, and the utility of the various types of motors has long since been demonstrated. In these latter steam, compressed air and electricity are the most important means of power.

As between these, the choice must be determined by local conditions. Where free or cheap water power is available, it lies between compressed air and electricity. Where water power cannot be obtained and steam is employed, it remains to choose either steam, air or electricity, either being dependent on the steam plant for generation of power which may be applied to either system which may have been selected.

THE executive committee of the American Mining Congress meets in Portland, Or., on the 10th inst. The principal business before the committee will be the arraugement of details for the next annual convention to be held in Portland in 1904.

THE zinc miners of the Missouri region are again strnggling with falling prices for spelter and are striving to nphold the price by cnrtailing the output. The producers are organized, but evidently all the prodncers of the region are not members, as they are apparently not a unit on the method to be pursned in attaining the desired end — higher prices for spelter.

ALL public lands included in forest reserves are subject to mineral entry, and Secretary Hitchcock is quoted as saying that there is no good reason why lands temporarily withdrawn should form an exception to the rule. In keeping with this, on the 24th ult. the Secretary ruled that mineral entries should be received on such lands. This applies to forest reserves only, and it shonld not be understood that mineral locations may be made in National Park reservations, with the exception of the Mount Rainier Park in Washington. To this park and reserve by special act of Congress the mineral laws are applicable. Not so the Yellowstone Park and the park reserves about Yosemite valley, Cal. Iudian and military reservations are also excepted from the operation of the mining laws. Formerly only those claims located within forest reserves, previous to their being set apart as such, were allowed to stand, but under this recent decision the forest reserves are subject to geueral mineral eutry under the same conditions as govern their location elsewhere on the public domain.

Mining Directors.

The duties of a board of directors of a mining company require that they shall assnme the responsibility for every investment, and for the success or failnre of the enterprise. The directors are usually men of business experience and affairs, but often have no practical knowledge of mining or metallurgy. They are elected by majority vote of the stockholders, the directors themselves often holding large blocks of stock—that is, in going concerns. In new mining corporations it is not infreqnently noticed that the names of the directors are those of meu prominent in political and commercial circles, and almost as often these men have no mining experience or practical knowledge of miniug and metallurgical business. To this fact may be traced the cause of uumerous failures in mine investmeut—the fact that the directors have no knowledge of the business they are trying to manage. In snch cases the company must rely wholly upon the superintendent, who himself may be sadly deficient in experience, though also with good business ideas and a reputation for honesty, integrity, etc. He is placed in the responsible position of superintendent or manager because he or his relatives, or possibly his friends, have invested heavily in the enterprise, and they feel secure under his management. Still, he may not know the difference between a sheave wheel and the snmp. The recommendations made by such managers, though honestly advised, are ofteu amusiug as well as absnrdly foolish and unnecessary. One such manager was much surprised when informed that in ordinary smelting operations either copper or lead were nccessary. He had thought that all that was required was a large furnace with plenty of ore of any kind and abundance of coke. In order to insnre the best results, every board of miuing directors should possess at least one competent mining engineer, who, by reason of his experience, is fitted to advise and to correct and prevent the blnnders so frequently made by inexperienced managers and boards. The superintendent would be better satisfied to have a managing director with whom to advise on difficult problems, such as the advisability of new installations or extensions of plant, and many other things.

Frequently, when the superintendent is doing his best, the directors find all manner of fault with him without canse, or, if there be a cause, the board of directors are themselves responsible for the difficulties which cause the lack of success of which they complain. Having a competent engineer on the board would often prevent the unnecessary expenditure of large sums of money, and it would tend to harmonize the mauy conflicting opinions so commonly occurring in mining boards.

A SUDDEN rise in the Yuba river, California, last week swept away the upper completed barrier, and the lower uncompleted dam east of Marysville, which were built under direction of the California Debris Commission. The members of the commission have gone to the site of the dams to investigate and will report to Washington the reason for the destruction of the dams, with possible recommendations for their reconstruction, presnmably on somewhat different lines. The upper dam was constructed as an experiment—built of mats of brnsh, rock and earth—on the theory that the silt aud sand carried in by the waters of the stream would fill the iuterstitial spaces, rendering it a solid mass of earth interwoven with brush, a material not dissimilar from the river bed itself. These calcnlations were wholly overthrown by the suddenness of the freshet. The principal agent of destruction as far as known was the battering of the crest of the dam by drifting snags, which tore a breach in the structure before it had become solidly compacted by the settliug within it of the silt and sand. The impression has been eutertained by some that these dams were constrncted with a view to the resumption of hydraulic mining ad libitnm on the streams tributary to the Yuba above the site of the dams. There was no such expressed purpose in the building of these restraiuing barriers, the primary object being stated to prevent the flow of fiue debris into the Sacramento river. Any mine at any point above the dams could only be operated under the permit of the Debris Commission as heretofore.

Nitro Powder in the Mill.

In the comparison of two types of mills in use in the treatment of telluride ores in the Kalgoorlie district of Western Australia, the author makes the remarkable statement that it is not an uncommon thiug for the muckers in the mine to shovel up a stick of nitro powder with the ore and send it to the mill; that in one of these mills the damage is considerable, as it sometimes blows the bottom out, while in the other mill, owing to its greater size, there is more room for the expansive force of the powder, and the damage is small. Uudoubtedly the frequent, or even occasional, explosion of a stick of nitro powder in the mortar or other crnshing receptacle of a quartz mill must prove annoying to the mill men, and incidentally to the owners, but it is strange that if this is the case in Western Australia no similar occurreuce has ever been reported in America, or if such be the fact it has never become generally known or excited more than passing comment. In the United States it is customary to take care of so dangerous an article as nitro powder and to see that it is not sent to mill with the ore.

It would be difficult to find a mucker in an American mine so absolutely devoid of instinct as to fail to pick up a piece of nitro powder should he see it in the muck or ore he is shoveling. A single day in a mine is generally sufficient to teach the veriest novice the danger that lurks in a stick of dynamite, and it is only the old experienced miners who, long accustomed to its use, become careless in its handling. Powder is sometimes blown ont from a hole into the drift or stope by the explosion of a neighboring blast, being cut off, but it rarely if ever reaches the mill in a condition to do damage. It would seem from the statement of the Australian writer that this branch of the business required closer supervision.

THE redecisiou of the Snpreme Court of California upon appeal of a case involving the nse of underground or percolating water has affirmed a new principle in the water law of the West. There is abundance of mining law, and most of it is sufficiently definite for all purposes, aud, with the possible exception of the extralateral right law, it is generally satisfactory. With regard to water, however, the law is less positive, and it is sometimes difficult to get a legal determination on a water qnestion without resort to the courts. Iu some sections of the United States the "riparian right" theory is strictly enforced; in other sections, where mining is an important industry, the lines are less rigidly drawn. Under the common law, no right of absolute appropriation of water for any purpose is recognized. The case upon which the Snpreme Court of California has passed for a second time did not involve the right to the use of water in a stream, but of snbterranean water flowing or percolating through the rocks. The case arose over the plaintiff having driven a well, securing an abundant artesian flow. On a neighboring rauch defendant snnk artesiau wells which drained the well of plaintiff. The court decided that defendant, who sold water from these wells, should only have the use of such water as could be used on the premises, and that the wells must be capped, or regulated in such manner as would restore the flow to the well of plaintiff. The fear was expressed at the time of the origiual decision that it would have a far-reachiug effect, and that rights in the oil fields would become involved. There seems no likelihood of that, however, as petroleum mining is regarded as an entirely separate and distinct indnstry. The application of the theory upon which the artesian well decision is based, to the oil fields, would precipitate a conflict of ownership which could not be settled in several geuerations; but of this there is no present likelihood.

SECRETARY HITCHCOCK has denied the application of an electric power compauy to constrnct a ditch through Yosemite Park, Cal., for the reason that a ditch would mar the scenery, and moreover be a source of expense to the Park Commission, without any commensurate beuefit. It is believed that this decision indicates the fate of similar applications for water privileges, dam sites, etc., in the Park and Hetch-hetchy valley on the Tuolumne river, Cal.

CONCENTRATES.

IN order to take advantage of the right to follow a vein on its dip beyond the side lines of a claim, the locator must include within his boundaries some portion of the apex of a discovered vein.

✣✣✣✣

THE ore samples from Grant's Pass, Or., are iron, which is evidently a pseudomorph after garnet. That is, originally garnet, it has been altered to iron ore, by the change which has taken place atom for atom.

✣✣✣✣

THE mineral samples from Gilpin county, Colo., are: No. 1 quartz with micaceous or specular iron, a form of iron oxide: No. 2 is iron oxide and black oxido of manganese. No uranium present in either sample.

✣✣✣✣

BEFORE the advent of circular saws for sawing logs into lumber, the straight upright saw was used exclusively. In many localities it was run by power derivod from some form of water wheel. The action of a saw of this description was vertical—similar to the "whip" saw run by hand power.

✣✣✣✣

ASSESSMENT WORK on all unpatented claims located prior to January 1, 1902, must have the assessment work for 1903 finished, or work actually begun upon them before January 1, 1904. The recommencement of work is only a step, for it must be continued until completed or the claim is subject to relocation.

✣✣✣✣

PHOSPHORUS is an element not ordinarily desirable in iron ore, but for the operation of what is known as the basic Bessemer process it is essential that the pig iron contain not less than 1.8% phosphorus. The process is largely in use in Europe, but it has a limited application in the United States, where the acid process is in general use.

✣✣✣✣

THE owner of a placer claim can not follow a vein or lode beyond the surface boundaries of his claim extended vertically downward. In order to secure the extralateral right it is necessary that the owner of the placer claim make a lode location on the vein discovered in the placer, the same as though it were situated elsewhere on the public domain.

✣✣✣✣

TELLURIDE ORES may be concentrated by passing the pulp after crushing through hydraulic classifiers and sending each class to a separate concentrating machine, the tailings being passed over canvas tables. This class of ores is difficult of concentration. They should be hand sorted, the poorer ores only being concentrated, the richer being shipped.

✣✣✣✣

THE speed at which a flywheel may be safely run is determined largely by the strength in tension of the arms of the wheel. The safe speed is placed at a mile per minute, but specially constructed wheels are run at much higher speeds. A wire-wound flywheel in Wales is 20 feet in diameter, and is wound with seventy tons of wire. It runs 240 revolutions per minute, or with a peripheral speed of 15,080 feet per minute.

✣✣✣✣

BY catenary curve is meant the curve of any flexible cord or similar object, when suspended from its ends. It is used to denote the curve of a surveyor's tape line when held suspended in the air. By laying it on the ground and stretching the tape tightly the loss by catenary is almost nothing and may be neglected in calculations, but in measuring across gulches, open cuts and the like, with long tapes, there is a certain loss by the catenary curve.

✣✣✣✣

HYDROCYANIC ACID is formed by the action of acids upon cyanides. It is obtained by pouring a cold mixture of seven parts of sulphuric acid and fourteen parts water upon ten parts of coarsely powdered potassium ferro-cyanide, contained in a large retort, the neck of which is turned upward so that only the most volatile portions will pass over during distillation. In the preparation of an aqueous solution the vapors are cooled and received in water. This is prussic acid.

✣✣✣✣

THE microscopic study of rocks demonstrates that rocks contain minerals in three distinct classes: Native metals, such as gold, silver and copper; definite chemical compounds, like feldspar, mica, quartz, galena, pyrite, hornblende, etc., and glass-like minerals, in which the several component elements are united, not in a definite ratio, but indeterminately. The constituents of rocks sometimes occur in microscopic crystals, the same mineral in another rock may form the largest portion of the mass.

✣✣✣✣

BRICKS are of two kinds—common or pressed building bricks and fire bricks. The former are often red, from iron oxide contained in the clay. The light colored bricks contain little or no iron. Fire bricks are made by mixing the clay with previously burned fire clay to prevent cracking or drying. Fire bricks are moulded for furnace linings in segments to suit the size of the furnace. Where fire bricks can not readily be obtained, a good substitute for furnace lining is often found by mixing clay and sand with salt water and plastering the inside of the furnace with it, or by setting a cylinder or other form having essentially the shape of the furnace within it, but allowing a space between the form and the side of the furnace, to be carefully packed with the wet mixture of clay, sand and salt. This is allowed to dry when the form is removed and a slow fire started. The heat may then be raised gradually. The salt melts and glazes the clay and the entire mass forms a solid brick, which, if properly made from suitable materials, will endure for a long time.

✣✣✣✣

WHERE it is desired to divide water as accurately as possible for the purpose of supplying different parties with a definite amount, this may be accomplished approximately by placing upright divisions in a large box, under and over which the water flows alternately. By increasing the size of the several compartments as the water passes from one to another the water is brought into a comparative state of quietude, and then may be divided by passing it through apertures of stated size, or by allowing it to flow into a flume in which a dividing partition has been placed, by means of which a stated proportion may be sent to either side.

✣✣✣✣

ORE FEEDERS are operated by means of an upright rod placed beside the central stamp of the battery and has secured at the top a rubber bumper. This is arranged at such a height that the tappet on the stamp stem strikes the bumper each time the stamp drops, the upright rod being connected with a spring on the bottom, which is so adjusted as to regulate the feed of the machine. Feeders are also operated by having a split collar fixed to the stamp stem underneath the cam floor, the collar striking a "U"-shaped yoke with each drop of the stamp. These devices are not so satisfactory as the bumping rod, for the yokes wear rapidly and require frequent repairs.

✣✣✣✣

THE time within which the statute of limitation begins to run in the case of trespass upon the ore bodies of a mine varies in the different states. In the case of surface trespass, where there is every opportunity for observation, the statute runs from the date of trespass, but in the case of underground trespass has been the subject of much discussion. It is the rule, however, that in the case of underground trespass the statute runs from the date of the discovery by the injured party that his property has been illegally invaded. The measure of damage from trespass depends upon whether the trespass was intentional or was the result of inadvertence or lack of the actual position of the dividing line. In the former case plaintiff is entitled to actual and exemplary damages.

WHEN figuring the width of belt necessary to run machinery at high speed the centrifugal force should be considered. The tendency of the particles of the belt is to move straight ahead and not to pass around the pulley. This forces the belt away from the pulley, so that as the speed increases the belt adheres less and less to the surface of the pulley, and a wider belt is required to transmit a given power than would otherwise be the case. For this reason, doubling the belt does not double the power it will transmit, but multiplies it by something less than two, and for this reason, also, there is a limiting maximum speed above which a belt cannot be run without great loss of power. For laced belts this is about 5400 feet per minute, and for cemented belts about 6300 feet per minute.

IN STOPING, excepting in very small veins, or where it is necessary to keep ore and waste separated as carefully as possible, there is no doubt of the advantage and economy of machine drills over hand work. In small veins it is often necessary to employ hand drilling only, and in very loose ground where the heavy blasting incident to rounds of machine holes, shake down the rocks and render mining difficult and dangerous, hand work is sometimes preferable to machine. The statement that a machine drill of a certain manufacturer is inferior to that made hy another, because the former shook down the loose ground, seems a point in its favor, rather than against it, for a machine drill that will not strike a heavy blow cuts ground slowly. If the ground is so had that the operation of the machine causes it to fall. hand drilling had better he resorted to for a time until the loose rock has been passed.

BLAST FURNACES employed in the manufacture of iron are much larger than those used in copper smelting. The largest iron furnaces are 100 feet in height, with a maximum diameter of 25 feet. The furnace, when in operation, is filled from top to bottom with iron ore, limestone and coke, or other fuel, though the lower portion of the column is fuel only, as the iron ore is melted by the great heat generated by the hot blast from the tuyeres, leaving the coke as the only solid substance in the lower part of the furnace. The limestone is changed to lime long before reaching the fusion zone of the furnace. Ore or other material charged at the top of the furnace passes downward to the bottom in twelve to fifteen hours. The siliceous and aluminous portion of the ore, the lime and the ash of the fuel unite to form slag, under which collects the molten iron. In its operation the furnace deoxidizes the iron, carburizes it, melts it and scorifies the slag, delivering slag and iron as separate products of the fusion. It is a principle in smelting any ore that oxidized bodies will not unite with unoxidized ones.

PORTLAND CEMENT is named from its resemblance to Portland, England, sandstone. It is manufactured from river mud (chiefly clay) and limestone, calcined at a high temperature. The so-called Portland cements of America, although imitations of the English article, are in many instances in no way inferior to the latter. Hydraulic cement is made from pure calcium carbonate, mixed with 10% to 30% clay. In some works a small quantity of fluor spar is added. The mixture is ground fine, calcined at a very high temperature, and the so-called clinker reground. In the process of calcining the carbonic acid gas is expelled, and the lime combines with a portion of the silica and alumina of the clay, producing tricalcium silicate, $3\,CaO,\,SiO_2$; and tricalcium aluminate $3\,CaO,\,Al_2O_3$. When the calcined material has been ground to powder (not less than 100 mesh), and the powder is mixed with water these silicates, which are anhydrous, unite with the water to form hydrons silicates, with the liberation of free calcium oxide (lime) which dissolves in water and immediately recrystallizes, thus causing the cement to "set." Roman cement consists of calcium carbonate and 25% clay, treated as above described. It sets rapidly after mixing with water.

COMMISSIONER WILLIAMSON of the General Land Office thus gives the view of the department concerning character of annual assessment on mining claims. "All improvements made on a mining claim having a direct relation to the development thereof may be taken into consideration. Any building, machinery, roadway, or other improvements, used in connection with, and essential to, the practical development of the claim will enter into and form a part of the expenditures for improvements. Necessarily, however, improvements of the character indicated must be associated with actual excavations, such as tunnels, cuts, shafts, etc., to clearly show that they are intended for use in connection with the claims under consideration." A house in which to live may be considered a necessity, but it is doubtful if the house could be charged up against annual expenditure on one or more claims, for if this were so a person might locate twenty claims and build a $2000 house in the center of the group, ostensibly for the benefit of the entire group. The next year he might build a barn or add to the house another $2000 worth, thereby holding the claims a second year, though not a dollar was spent in the development of the group. The principle involved is the same for one location or two. A hoist building or a blacksmith shop; gallows frame or other construction, or machinery for the actual benefit of one or more locations may properly be charged to annual assessment.

REPLYING to the Silver City, N. M., correspondent: Evidently the instructions laid down by Stotefeldt have been followed, and the roasted sulphides have formed a matte with the iron and the earthy fluxes employed. The heat evidently was insufficient to accomplish the desired result. Melting and refining silver sulphides, precipitated from hyposulphite solutions, has formed one of the most difficult problems of metallurgy, and has been the subject of several patents for processes. C. H. Aaron, in his work on "Leaching Gold and Silver Ores," p. 73, says: "The dried precipitate is roasted in a small reverberatory to burn off the greater part of the sulphur, beginning with only sufficient heat to ignite the sulphur, gradually increasing the temperature to dark red, or to such a degree as it will bear without melting. It must be stirred while melting, and shifted from end to end of the furnace. If but little base metal is present, the roasting is continued until as little as possible of sulphur remains. The roasted sulphide is melted in a black lead (graphite) crucible, in a wind furnace, with coke or charcoal for fuel (coal is not advised). If the precipitate, before roasting, contained but little base metal sulphide, the silver may be seen in the form of threads in the roasted mass, which still contains a considerable quantity of sulphur. The crucible, containing some scrap iron, is filled with sulphides and placed in the furnace, standing on a piece of fire brick, for, as melting occupies a considerable time, even a thick layer of the best coke does not last long enough to prevent the crucible from settling down to the grate. A little borax is added and the whole heated till there is room in the pot for more material, when it is refilled, using a scoop and funnel. As fast as the scrap iron disappears more is added, but if such addition is made after full fusion the iron is first heated. If the roasted precipitate contains much copper or iron, more borax is added, and a little clean quartz sand is useful, especially if the roasting has been excessive. Charcoal is also added. When the pot of sulphides is thoroughly melted matter and pieces of iron, a test is made by placing the end of a red-hot iron in the molten mass. After allowing it to remain a few minutes it is withdrawn, and if it be found that part of the iron is melted more time is allowed. When iron is no longer consumed the melt is complete, and slag and matte are dipped out with a small red-hot crucible, handled with the tongs, and poured into a mould or an iron pan. The pot is now refilled with roasted precipitate, adding it slowly until the melted mass is somewhat chilled. When all the precipitate has been thus treated, or the pot contains a sufficient amount of metal, a part of the slag and matte is removed as before, and the remainder is poured, together with the silver, into a heated mould. If it is intended to plunge the moulded silver bar into water to cool it, the matte must first be removed, or an explosion is likely to occur, if the matte has not also been solidified. If the melting has been properly conducted the matte will be brittle and separate easily from the metal. All slag and matte should be carefully examined for large silver buttons. The former may be sold to smelters and the latter crushed and reroasted and worked for silver."

Aluminum Not Easily Soldered or Plated.

The ever-present, invisible film on an aluminum surface has a great influence on the success of various operations, especially soldering. The film is supposed to have considerable strength and continuity, aud if it is broken or removed by mechanical meaus the aluminum immediately forms a new one. In soldering aluminum the principal difficulty seems to be due to the failure of the alloy used as solder to adhere to the aluminum, a condition attributable to the protective film, which must be eliminated before the metal can unite. A successful solder consists of about 21% of ziuc, 76% of tin and 3% of aluminum; it may be applied directly to a cleaned aluminum surface without the use of a flux and at a temperature but little above that which is necessary for soldering copper or iron. There are certain advantages in the apparent complication which the use of a flux involves; a suitable solvent for the oxide film increases the rapidity of the soldering process, increases the certainty of adhesion and enables cheaper soldering mixtures to be used. The requirement for such a flux is that it should dissolve the coating and leave a clean surface for the solder to unite with, upon application of heat. It seems that water can not be a component of a suitable flux. A material which for certain solders forms an admirable flux is stearic acid; by applying it to a freshly scraped aluminum surface and then a tin-lead zinc alloy, the matter of soldering aluminum presents scarcely greater difficulties than does the soldering of other metals. This almost ever-present coating upon aluminum is also the source of difficulty in the deposition of a permaneut coating of other metals upon aluminum surfaces. While it is very easy to deposit a layer of metal upon aluminum from almost any plating solutiou, in the great majority of operatious the resulting coating can be readily removed, sometimes in remarkably thiu and continuous layers. The prime requisite in successful depositions on aluminum is the complete removal of the protection film, so that the electro-deposited metal may be applied over the complete surface of and in intimate coutact with the aluminum. If this condition is fulfilled, and the coating is nou-porous, it will be durable. The couverse of this operation—that is, the electro-deposition of aluminum upon other metals—appears to be impossible from aqueous solution, says Electro-Chemical Industries.

Mexican Bullion Tax.

The taxes levied for amonedacion or coinage, or, in other words, for turniug gold and silver bullion from Mexican mines into coin or specie, says the Mexican Investor, are as follows:

Federal taxes:

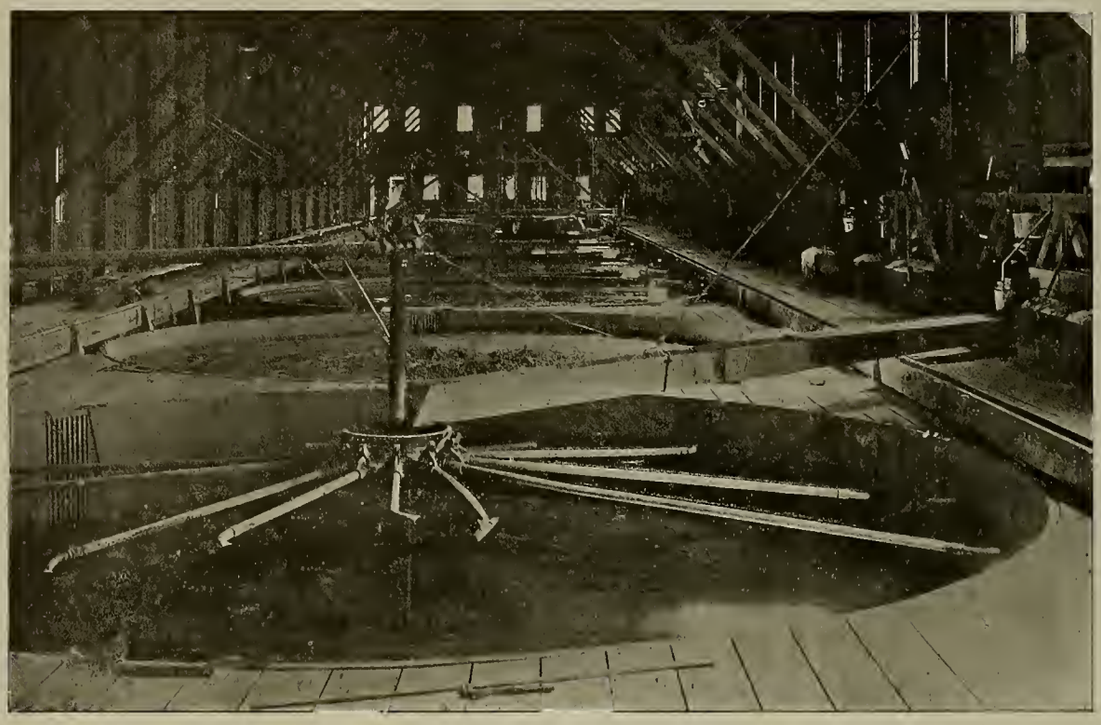
1. A coinage duty of 2%.
2. A stamp duty of 3%.
3. A Government assayer's fee of $2.50 per bar of 35 kilograms or auy fraction thereof.

State taxes:

1. An export duty of 2%.
2. A stamp duty of 25% on the State export duty of 2%.

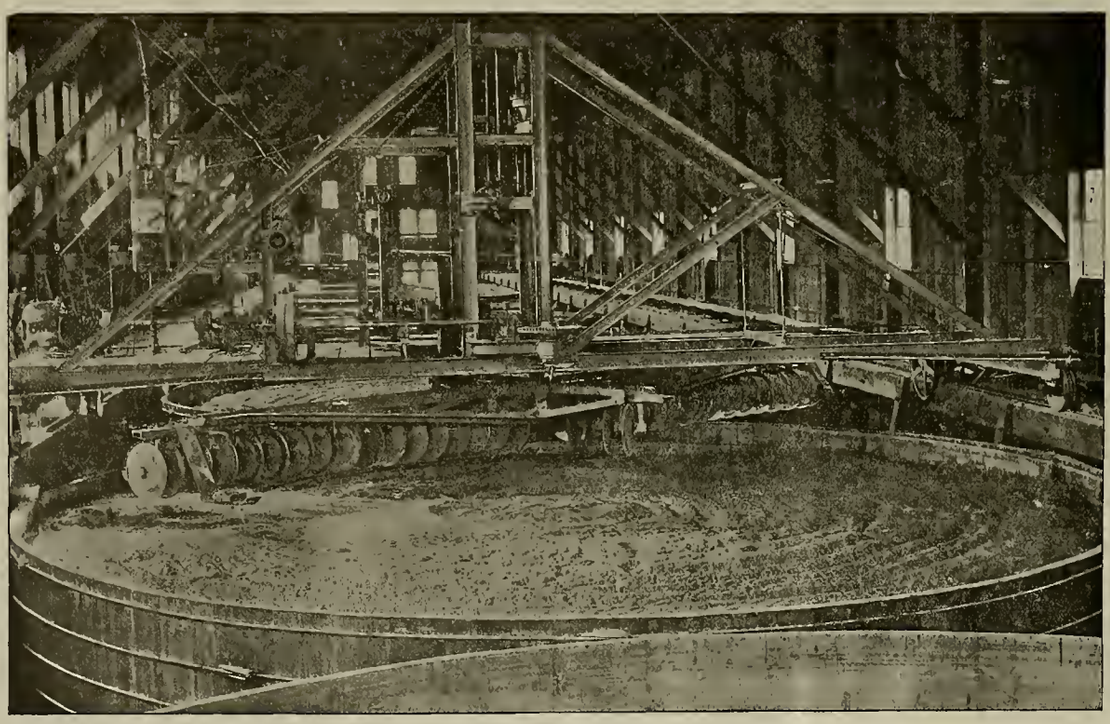
The collection of Federal taxes ou bullion is based on the fixed valuatiou of silver at $40,915 per kilogram and of gold at $675,416; to the latter is added the rate of exchange resulting from the average of exchange of New York during the first twenty-five days of the previous mouth, which rate is decided mouthly by the Treasury Department and opportunely wired to all offices and maritime and froutier custom houses.

In every statement of taxes the Mexican dollar is the unit.



COCOA MATTINO used in cyanide aud other mills, aud for covering of uudercurrents to act as a riffle iu catching fine gold and black sand, is a coarse fabric made of the fiber obtained from the outer shell or husk of the cocoanut. It is similar to cocoa floor matting, but inferior in make, more open, and designed especially for the purpose for which it is used.

Cyanide Plant Machinery.



Since the introduction of the cyanide process in the treatment of ores great changes have taken place, both in methods and in the character of machinery employed in the process. In small plants the means of handling material is essentially the same, but in larger installations, aud particularly in those where slimes are troublesome, many unusual and ingenious devices have been introduced aud are successfully employed.

In the operation of the cyanide process, owiug to the low grade of material usually treated, the handling of sands and slimes must be reduced to a minimum. To accomplish this various mechanical devices have been introduced, and among these some of the most interesting are those illustrated herewith, and also on the front page, mauufactured by the H. W. Blaisdell Co. of Los Angeles, Cal.

When tanks are to be filled with mill tailings or crushed ore for cyanide treatment, it is desirable to charge the tanks with the material as uniformly as possible, and to prevent the segregation of slimes from the sands, and particularly to overcome the formation of layers or floors of slimes, which render percolation slow and difficult, and sometimes impossible. To obviate this mechanical distributors are employed, one form of which is illustrated in the accompanying engravings. It is in use at the Butters cyanide plant at Virginia City, Nev. The distributor is carried by a traveling crane over the vats. At the rear end of the building is shown an excavator in the act of removing the pulp from a tank. The excavator does away with manual labor almost entirely. A nearer view of one iu operation is shown in another of the illustrations, working in a tank 30 feet in diameter in the Butters plant at Virginia City, Nev. It is what is described as a bottom discharge machine, with a capacity of 100 tons per hour, and it daily removes 300 tons of sands from the vats to a 16-inch conveyor running beneath them. This excavator, as will be noticed, is moved along the building from tank to tank by a traveling crane, so that one machine is sufficient for the entire plant.

Butters Distributor, Carried by Crane Over Vats, Butters Plant, Virginia City, Nevada.

Excavator at Butters Plant, Virginia City, Novada.

In another engraving is shown an exterior view of the Butters Virginia City plant, with mechanical haulage of cars up into the mill.

A traveling bridge over a line of cyanide vats, illustrated on front page, is in use at the King of Arizona mine at Kofa, Ariz. A double row of vats at the Gold Roads mine, Acme, Ariz., is also shown on the same page, where a mechanical distributor is moved

from tank to tank by means of a bridge carrier.

In modern plants manual labor is dispensed with as far as possible, and the introduction of such devices as here described and illustrated makes the process almost automatic. In some plants tailings are sluiced from the tanks through doors in the lower portion of the side or arranged in the bottom, but in a region where water is scarce it is not economy to employ this means. In such cases the mechanical excavator proves its value.

Power Transmitted by Shafting.

Shafting must be of a size and kind suited to the amount of work required of it. To find the amount of horse power a given shaft will transmit, take from the table given below the factor given for the size and character of shaft and multiply by the number of revolutions per minute:

To find the size shaft required to transmit a given amount of power: Divide the number of horse powers required by the number of revolutions per minute; the result will be the factor given in the table opposite the required size of shafting.

TABLE SHOWING POWER FOR EACH REVOLUTION OF THE MAIN SHAFT.

Size. Inches.	Iron. Rolled.	Steel. Turned.
1⅝	.107	.060
1⅞	.132	.073
2	.160	.089
2⅛	.190	.106
2¼	.220	.126
3⅜	.270	.150
2½	.310	.170
2¾	.410	.230
3	.540	.300

HORSE POWER FOR EACH REVOLUTION OF COUNTER SHAFT.

Size. Inches.	Iron. Rolled.	Steel. Turned.
1⅝	.142	.086
1¾	.180	.107
1⅞	.220	.132
2	.260	.160
2⅛	.320	.190
2¼	.380	.220

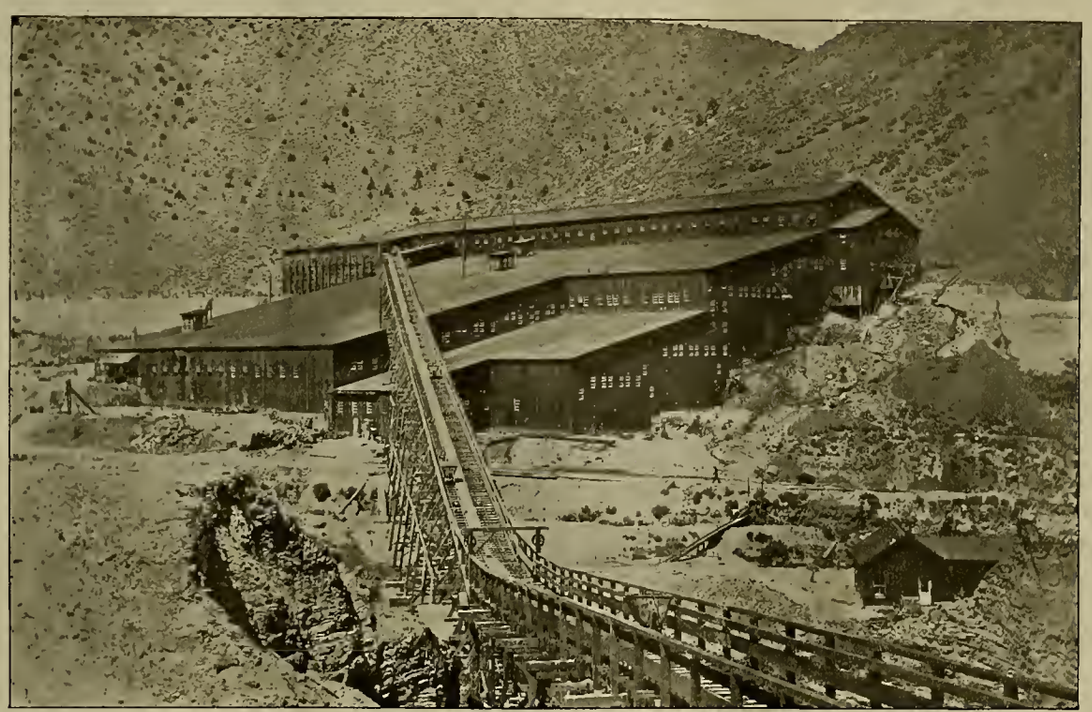
ALL well regulated mills are supplied with foot boards to be placed across the plates in front of the battery. These should be so constructed as to be removed when cleanup is in progress. In some mills the plates next the battery are movable, the upright supports being provided with castors which run upon a half-round track. By this means, when work is to be done in the battery, such as renewing shoes and dies, the plate may be run backward, the upper plate overlapping the next plate below. This affords room to work at the mortar and makes the handling of the heavy castings much easier.

A PLACER CLAIM must be staked in the same manner as quartz claims, even though they conform to the legal subdivisions of the survey. If a claim is not so staked others than the locator may remain in ignorance of the fact that a claim has been taken. It is not a matter of State or local custom, but of federal law.

THE loss of mercury is much greater in mills where inside amalgamation is practiced than where the quicksilver is spread on the outside plates only.

Causes of Gold Mill Losses.

Written for the MINING AND SCIENTIFIC PRESS.



When it is learned, through the medium of assays of tailings, that there is a high percentage of loss in milling gold ores, the first step to be taken to correct such loss is by locating the form in which such loss occurs. Loss of gold may occur in any one of a number of ways, or in several ways, a little being lost in each stage of the operation after crushing. It may be that the mercury is flouring and carrying away gold; gold already amalgamated and attached to outside plates may be scoured off and if not caught on the concentrators is lost; or the loss may be in imperfect concentration. Still another cause of loss, and one not generally suspected, is in the fact that golden particles remain in uncrushed grains of the gangue. In other words, the crushing is too coarse.

Amalgamation on copper plates or silver-plated copper plates is a metallurgical process that has long been in successful use, and it is one well adapted to the treatment of a wide range of gold-bearing ores, if the mill man thoroughly understands his business. "Rule of thumb" methods in a gold mill are not prolific of the best results. A mill man may have learned by experience, or through instruction, how to treat the ore of a certain mine with a fair degree of success, but at another mine his practice would, perhaps, fail to accomplish satisfactory results. It is not an uncommon thing to find the ore at a mine unoxidized. Amalgamation is still practiced. Sizing and classifying devices are employed and the tailings are cyanided in two classes—the sands and the slimes. The present practice was fully described in the MINING AND SCIENTIFIC PRESS in the issues of October 3 and 10, 1903.

The above is cited as an illustration of the career of many mines. In Arizona many veins contain free milling gold ore in the oxidized zone. At depth the sulphides of copper, iron and lead appear, and in some districts veins which show no trace of zinc in the upper portion of the veins, produce the sulphide of that metal in abundance in greater depth. It is usually the last sulphide to appear. This change in the character of the ore usually necessitates a radical change in milling methods.

In many mining regions where the ores are considered free milling, where amalgamation is practiced, and concentrators are in use, not over 85% to 90% of the values are saved, and the cyanide process is employed to extract additional value from the tailings. In some of these mills it is no doubt a fact that an increased saving could be made by finer crushing, and by sizing and classifying the pulp from the amalgamating plates before attempting concentration.

The most common causes of loss of value in gold mills are: Direct loss of gold, amalgam or quicksilver, due to either scouring or flouring of the mercury; gold imbedded in the grains of the gangue not crushed sufficiently to free the gold and render it susceptible to amalgamation; gold imbedded in sulphurets; gold in slimes, and gold in a condition which renders it impossible of amalgamation on copper plates—as in the case of gold covered with a film of silica, iron oxide, or other impenetrable substance; or gold alloyed with other minerals as is the case with some telluride ores.

300-Ton Cyanide Plant, Virginia City, Nevada.

The only way in which gold remaining imbedded in grains of the gangue can be caught is by finer crushing or grinding. Gold which is imbedded in particles of sulphide ore which may escape amalgamation should be caught on concentrators if the devices are of proper kind and the man in charge understands the adjustment of the machines. Gold in slimes which cannot be amalgamated offer a difficult problem to the mill man, and the only remedy is to lower the discharge of the battery, add more water and use every endeavor to facilitate the discharge of the pulp from the mortars as soon as possible after being reduced in size to pass the apertures of the screen, but when this is attempted a loss may be caused by incomplete amalgamation. It is the theory of the high, slow-drop as practiced in the Gilpin county, Colo., mill that with high discharge the mercury is thoroughly mingled with the pulp and a more complete amalgamation results, which is doubtless the case. In a mill where losses occur in the slimes, however, the cyanide process is thus far the best solution of the problem that has at yet been offered. Where the particles of gold are covered with a film of any sort which is impervious to the action of the mercury then attrition is usually beneficial, and this is accomplished by crushing in one of the many forms of rotary grinding mills, or in an arrastra.

When the gold is not susceptible to amalgamation, as in certain telluride ores, it must be treated by some other method than amalgamation, for even roasting does not render all the gold subject to amalgamation. The ores of the Cripple Creek, Colo., district, and those of the Cambrian beds of the Black Hills, are of this class, and in these districts, as well as those of Western Australia, the various wet processes of chlorination and cyanidation find their most satisfactory application. Some of these ores are previously treated by amalgamation, the tailings being treated by a wet process.

If there are losses in amalgamation the tailings assays will detect it, but the testing of tailings by fire assay will not locate the character of the loss, nor the particular place where it occurs. To arrive at definite knowledge of this sort it is necessary to make a thorough and systematic series of tests.

A sample of tailings should be carefully panned to determine whether it contains free gold, amalgam or quicksilver. Finding either of these, a change must at once be made in the method of amalgamation. When samples no longer show gold, amalgam or mercury, a sample should then be screened through two sizes of screen—say 60 and 100 mesh. This will result in giving three sizes of pulp—that which remains on a 60 (supposing the mill screen to be a 30 or 40 mesh), that which remains on the 100, and that which passes the 100 screen. Separate assays should be made of the three products of screening. Should the coarsest particles contain the highest values, finer crushing will probably reduce the loss if the values contained justify it. If this coarse material change materially with increasing depth. The Homestake mines of South Dakota form a good example of this fact. In the early history of the mine the ore was an oxidized, highly ferruginous quartzose rock with semi-schistose to massive structure. The rock was a typical free-milling ore and no attempt further than straight amalgamation inside the batteries and out was made to save the gold. There was always a certain loss, however, which was detected by tailings assays. It was found that quicksilver and amalgam escaped, presumably scoured off the plates. To check this loss mercury traps were placed in the mill. The mills ran from 1877–'78 to about 1886 without these traps. In a single month in the Homestake mill, at that time containing 80 stamps, 80 ounces of amalgam and 144 ounces of quicksilver were saved in the inside traps, and in the outside traps 10 to 12 ounces of amalgam and 40 ounces of quicksilver. This saving represented a value of about $520, or about $0.065 per ton, a trifling amount in itself, but when it is considered that at that time the company operated 580 stamps, and if a proportional amount were saved in each mill it would have amounted to nearly $45,000 per annum. So far as known, no authoritative statement as to the total amount thus saved has ever been made public.

Prior to the introduction of the mercury traps the only attempt made to save values escaping in the tailings was that of running the tailings over long lines of narrow inclined planes, the floor of which was covered with full widths of Brussels carpet. These caught a large percentage of the sulphurets which had appeared in the ore with depth, and also a great quantity of low-grade sand. The sulphurets were stated to be worth about $25 per ton.

Since then many changes have taken place in the milling methods. Nearly all the ore treated now is

contains sulphurets, sizing and classifyiug may result in increasing the saving on the conceutrators aud finer crushing may not have to be resorted to. This can usually be determined by grinding the coarse sand in an iron mortar with mercury. If the gold be in a free state after the removal of the quicksilver and amalgam, an assay of tailings from this operation will show a decrease in values in the sample.

Should the several samples of screened pulp show no great variation in value it is doubtful if finer crushing is advisable as it will diminish capacity without increasing the saving.

In case the fines contain the highest values a coarser screen in the battery may be tried. This will increase capacity and may not materially increase the loss. Should the percentage of loss increase with coarser crushing theu cyaniding of the slimes may be resorted to. Sometimes a change of screeu—from slotted screens to woven wire, or needle punched, or vice versa, is advisable. In fact a series of experiments must be made to locate and stop the loss of values.

In the average gold ore a system of concentration after amalgamation is necessary, aud the result is usually satisfactory. In some districts the conceutrates are too low in grade to permit their being shipped at a profit. In such case they may be treated at the mine by chlorination or cyauide. Sometimes the former is considered not justified by the amount of sulphurets produced. In such case they may be stacked and accumulated until a sufficient quantity is on hand to justify the erection of works. Attempts have been and are now being made at various mines to cyanide sulphides direct. Thus far fair success has attended these efforts on very fine material such as that collected on cauvas plants, but the results from the direct treatment of coucentrates from the machines has not always proveu satisfactory. When this is the case grinding may be resorted to with good results.

Generally speaking, if the amalgamators and concentrator men in stamp mills understand their business thoroughly the canvas plant will have a limited field of usefulness.

Treatment of Telluride Ores at Kalgoorlie, Western Australia.*

Written by W. E. SIMPSON.

The discovery of the various tellurides of gold on the Kalgoorlie gold fields entailed a large amount of metallurgical activity aud experimental research, resulting in the devising of many different processes for the extractiou of the precious metal.

Ordinary battery treatment with subsequent concentration and cyauidatiou of both tailings and slimes gave poor and nuremunerative results. The tellurides floured badly, escaped concentratiou, floated over into the slimes, aud, being practically insoluble in plain cyanide, passed out with the residues. Ordinary cyanide, the worker of such wonders on other gold fields, had reluctantly to be voted an unqualified failure ou these refractory ores. Smelting was certainly a success so far as the extraction of the gold was concerned, but the cost was so great that only ores of very high assay value could repay it. Chloriuation was out of the question for analyses of the ores showed the presence, in some cases, of as much as 20% of carbonate and sulphate of lime. Cyaniding was then tried; the ore was roasted and allowed to cool, and charged into vats. A solution of cyanide was pumped into the vats and allowed to percolate through the roasted material. The originators of this style of treatment had overlooked the fact that the sulphate of lime preseut in the ore, as well as that formed in the furnace by the action of burning sulphur on the carbouate of lime, would become converted into plaster of Paris. When moistened in the vats this set hard, became impervious to the solution, resisted further percolation, and, after perhaps a month's treatment, yielded less than half its gold. Another objection too, was that the "residues" had practically to be quarried out of the vats, a process which nearly always required the aid of a little dynamite.

Many other examples can be quoted of "processes" which sprang up like mushrooms, only to again sink into oblivion, and at the preseut time there only remain two which have survived—viz., the "Diehl" process and the Dry or all-roasting process. The former consists, with certain modifications, of wet crushing, amalgamation on copper plates, coucentration aud separate treatment of the concentrates by roasting or by smelting, sliming the remainder, agitation, in presence of cyanogen-bromide to attack the .tellurium, and cyanide to dissolve the gold, followed by the treatment of the pulp by filter-pressing. The latter, which is equally efficient, begins with dry crushing, followed in succession by roasting, sliming in amalgamators, agitation with plain cyanide and filter-pressing. Precipitation on zinc shavings is common to both processes.

DRY CRUSHING AND ROASTING PROCESS.—The first "all-roasting" plant to give satisfactory results on a large scale was that of the Boulder Main Reef, Ltd., and it speaks highly for the process that, although slight improvements have been introduced from time to time in some minor details, the main principles have been but slightly altered. Despite the fact that it is now the oldest sulphide plant on the field, it still continues in active operation, and for efficiency and ecouomy it is still able to hold its own with its more modern and mammoth neighbors.

The plaut proper consists essentially of one No. 3 Gates rock crusher, two No. 5 ball-mills, three mechanical roasters, six grinding pans, four agitation vats, with mechanical stirrers, four filter presses, one small clarifying press, three precipitation boxes, with sumps, pumps, piping, and the other usual accessories attached to a plant. A 250 H. P. Fraser & Chalmers Tandem Corliss engine drives the whole plant, and a battery of four 22 feet by 6 feet 6 inch boilers supplies all the necessary steam for this, as well as for the air compressor, dynamo aud windiug engine.

The ore mined and treated varies considerably in chemical composition, being very calcareous from the surface down to the 600-foot level, aud becoming more siliceous as depth is attained. Analyses show the amount of each constituent to range within the following limits:

Silica	40 per cent	to 60 per cent.	
Alumina	13 "	to 16 "	
Ferric sulphide	6 "	to 10 "	
Ferric oxide	7 "	to 10 "	
Carbonate of lime	15 "	to 20 "	
Magnesia	4 "	to 7 "	

With traces of copper, lead, zinc, arsenic, etc. There is practically no free gold, all being combined with tellurium.

CRUSHING AND MILLING.—The ore, as it comes from the mine, is dumped on to a grizzly the bars of which are set 2 inches apart. The smalls pass through, leaving the blocks to be roughly spalled by hand and crushed by the Gates rock breaker; the stuff falls into a 100-ton bin, from which it is fed, by means of a Challenge ore feeder and a Robins belt conveyor to the ball mills; these deliver it by a bucket elevator and screw conveyor to one of two small bins over the roasters. The mills are uot now fully employed, as the shaft furnace, the original roaster, has been discarded, aud ouly sufficient ore is milled to supply the three furnaces.

On the Kalgoorlie field two classes of dry crushers are used—viz., ball mills and Griffin mills. Ball mills for years have given satisfaction on the Associated, Kalgurli, Hannan's Star and Boulder Main Reef gold mines, while the Griffin mills claim supporters on the Perseverance, South Kalgurli aud Great Boulder Proprietary. As the Great Boulder Proprietary and the Boulder Main Reef are adjacent mines, working the same lode, which is practically ideutical in character, chemical composition and physical properties in both leases, a comparison between the efficiency of the two crushers is possible; bnt comparisons of costs, other than those of geueral maintenauce, etc., are scarcely fair, because in the larger plants power can be produced at a much lower rate per unit, and the cost of supervision, etc., is divided over the greater tonnage treated.

In comparing the output of these mills, it must be recollected that the Griffin is fed with pieces no bigger than walnuts, whilst the ball mills take lumps as big as the fist. It was found on one occasion that 75% of the ore fed to the ball mills at the Boulder Main Reef was too large to pass through a 2-inch ring; indeed, 3% proved too large to pass through a 6-inch ring. These mills were each treating thirty-three tons a day.

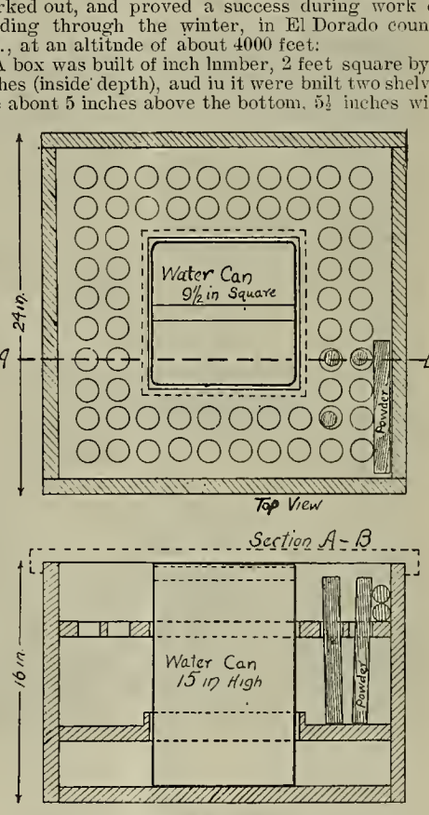
Of the twelve Griffin mills installed on the Great Boulder Proprietary mine, uever more than ten are running at one time. The wearing parts—i.e., the roll shells and followers, costing £3 5s. to £2 2s. each respectively—require renewing every eight days, while the die rings, costiug £4 each, and the roll bodies, costing £3 3s. each, last about six or eight weeks. On the South Kalgurli the pendulum shafts are replaced on an average every two months, at a cost of abont £10 for material alone. Driving belts also suffer severely, and require to be renewed twice a year. The power required is 20 I. H. P. per mill, and the output is 1.25 tons per hour of running. The screen area of the ball mill is large and sufficient to secure the discharge of the ore immediately it has been reduced to the required degree of fineness, and as the screens themselves revolve they are subjected to internal scouring, which keeps them clean and in proper trim for efficient working. The cost of maintenance is moderate, one steel ball, weighing eighteen pounds, beiug put in each mill every day with the charge of ore in order to make up for the consumptiou of metal. The other wearing parts are the grinding plates and side liners, which are replaced in complete sets every seven or eight months, and cost £180 delivered on the mine. The driving belts on the Boulder Main Reef, which are of camel's hair, have been in use continuously for over four and a half years, and look as if they would still last a loug time. Each mill makes twenty-five revolutions per minute, requires about 24 I. H. P., and has an output of over one and a half tons per hour. The total weight of the steel balls in each mill varies from one ton to twenty-two cwt.

An examination of the powdered ore leaviug the ball mills on the Boulder Main Reef, where a screeu of twenty holes to the linear inch is used, furnished interesting data. A sample assaying 16 dwt. per ton was treated on a series of brass wire sieves. The portion retained on each was carefully weighed and assayed separately with the following result:

					Oz.	dwt.	gr.
Retained on	40-mesh sieve	24.1%	assaying		0	7	20
Passing 40	" 60	" "	9.4%	"	0	11	18
" 60	" 80	" "	6.2%	"	0	13	7
" 80	" 100	" "	6.6%	"	0	17	0
" 100	" 150	" "	3.3%	"	0	18	7
" 150	" 200	" "	4.3%	"	0	18	7
" 200	" ...	" "	46.3%	"	1	0	6

It will thus be seen that as regards value the ball mills produce only two qualities. The coarse, largely made up of hard particles of quartz, is comparatively poor, while the fine contains most of the gold, owing to the friability of the sulphides and tellurides.

(TO BE CONTINUED.)



*Abstract Trans. Institution Mining and Metallurgy.

Design for Powder Thawer.

TO THE EDITOR:—From time to time you have published in the MINING AND SCIENTIFIC PRESS descriptions of powder thawers, while almost invariably the statement is made that no dry heat should be used in thawing dynamite. Nearly all those described call for lighted candles as the source of heat.

Not only with the idea of eliminating the candles, but also to get a thawer that would thaw, as safe as possible to make it, and made from such supplies as are at the hand of every miner, the following idea was worked out, and proved a success during work exteuding through the winter, in El Dorado county, Cal., at an altitude of about 4000 feet:

A box was built of inch lumber, 2 feet square by 15 inches (inside depth), aud in it were built two shelves, one abont 5 inches above the bottom, 5½ inches wide,

Powder Thawer.

with a raised rim ½ inch thick and 1 inch high; this shelf was built all around the box, leaving in the middle a hole 10 inches square. Six inches above this shelf was placed a rack, 6 inches wide, all aromnd the box as before, leaving the 10-inch hole in the ceuter; this rack was bored with sixty-four holes, 1½ inch in diameter, spaced 2 inches apart.

To thaw a lot of powder, one stick can be stored in each hole—sixty-four in all; if more is required, they can be laid in between and aromnd the sides. An empty five-gallon coal oil can, top cut out and wooden handles nailed in, is filled with water and heated on the forge, or wherever convenient, until nicely warm—not hot—placed in the magazine box and air-tight cover placed over all.

The heat radiating from the warm water, and held in the box by the non-conducting walls, will slowly thaw out the powder, and in the course of two or three hours it will be soft and ready to use. It is surprising how loug a can of water will remain warm when euclosed in a woodeu box. We would put a can of warm water in when leaving in the eveuing and find our powder still soft in the morning.

The size of the standard five-gallon coal oil can is 9¾ inches square by 13½ inches deep; hence the above dimensions. I see no reason why the box could not be made cousiderably larger, so as to have three or four rows of sticks of powder, if desired.

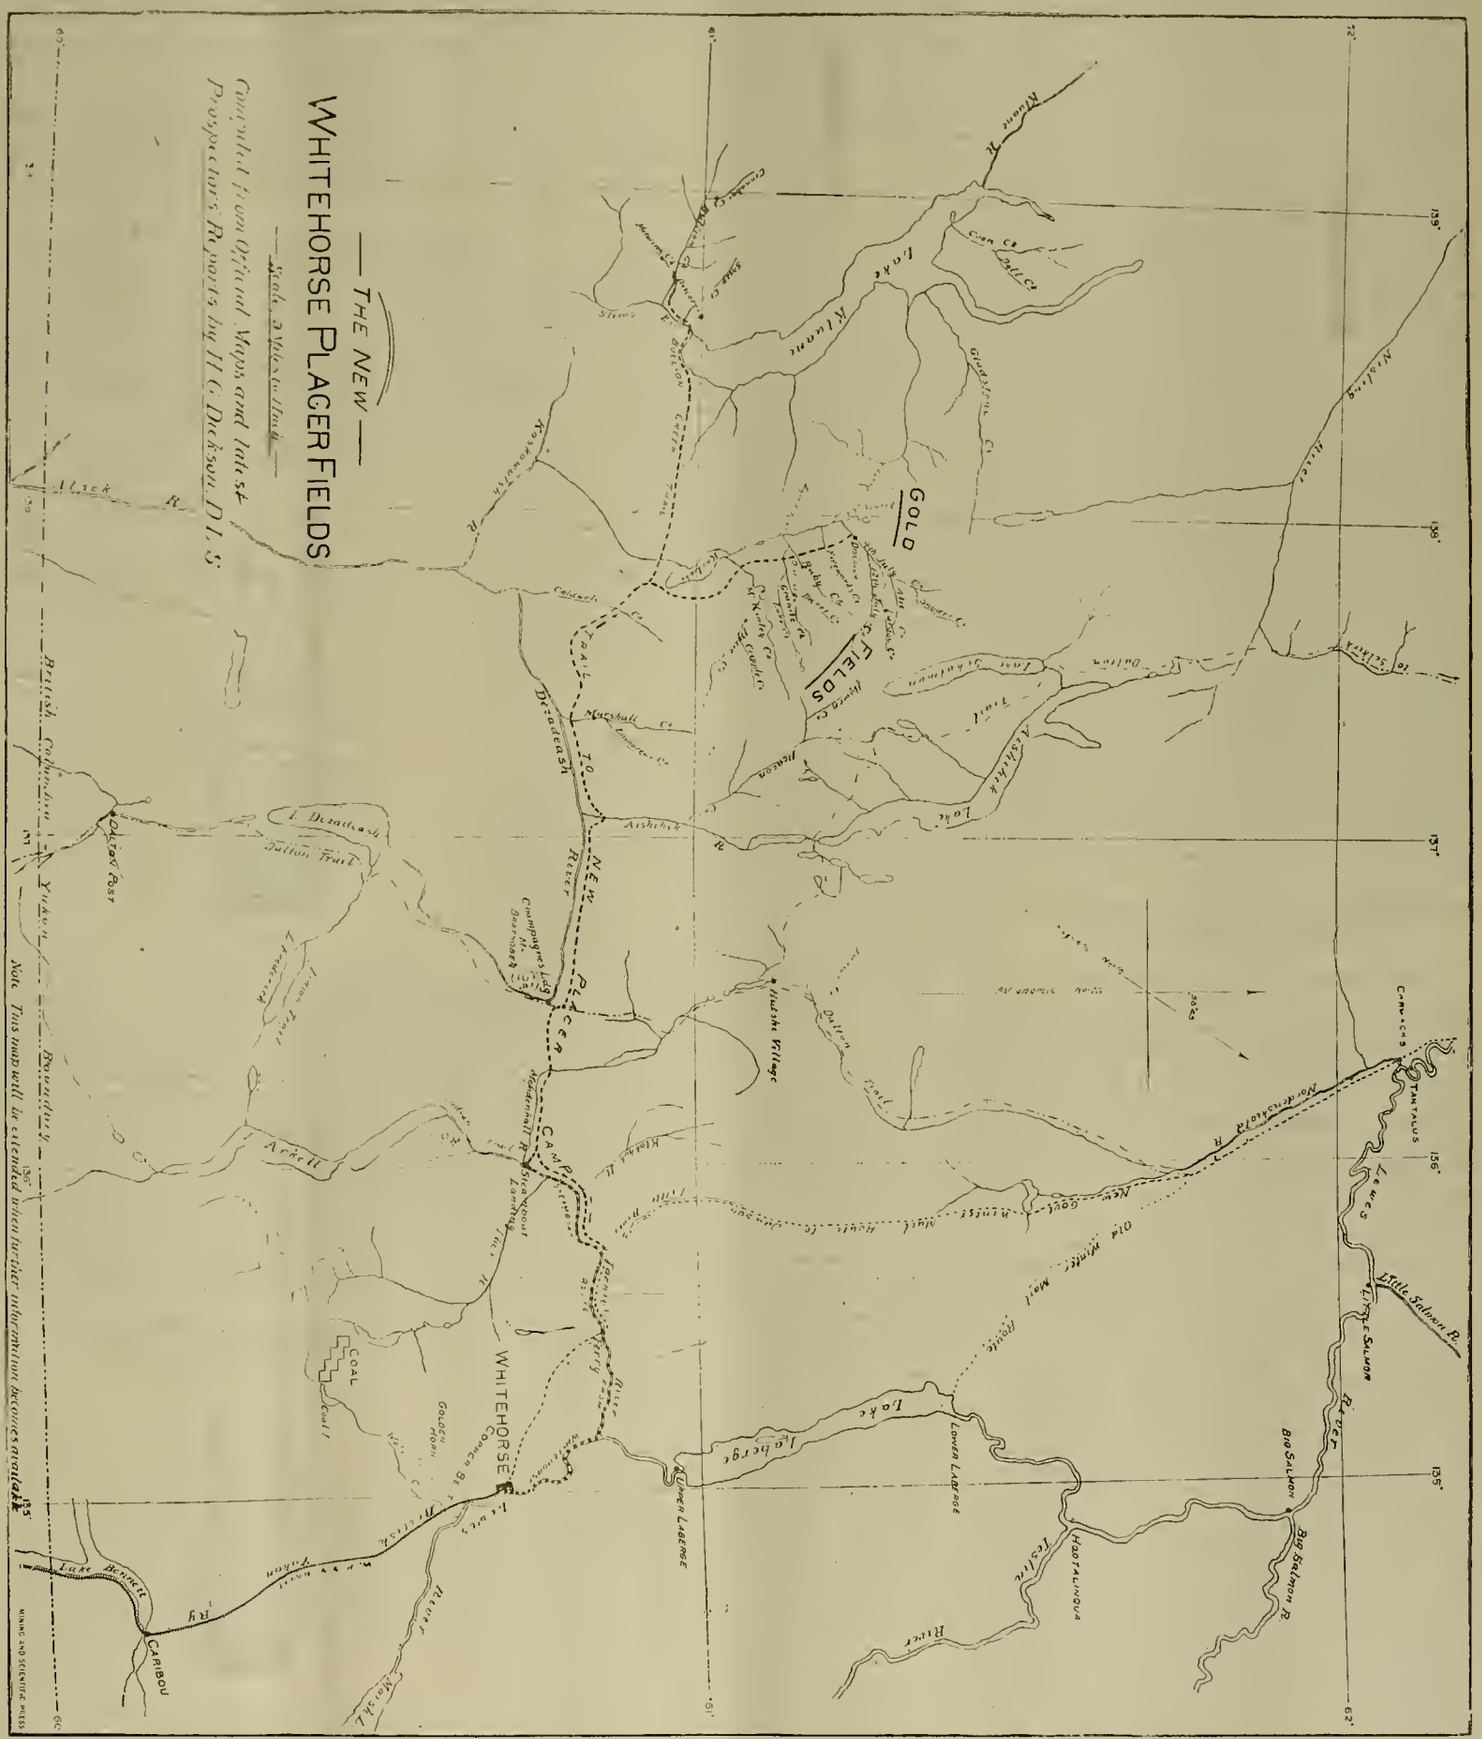
If the box were made double, with a layer of sawdust between, it would undoubtedly be an improvement. I believe this is as safe a plan as any for thawing powder, and it works very satisfactorily in cold weather. CLIFTON H. WILDMAN.

Mt. Hope mine, El Dorado county, Cal., Nov. 18.

The Alsek Placer District, Yukon Territory.

Written for the MINING AND SCIENTIFIC PRESS by W. M. BREWER.

During the summer of 1902 discoveries of placer gold were made by Dawson Charley, an Indian, and his associates on a creek about 12 to 14 miles long, situated near the headwaters of the main tributary of the Kaskawulsh river, itself a tributary of the Alaska river which flows through that portion of the Yukon Territory across a strip of British Columbia and into the ocean in United States territory westerly from Lynn Canal.



The location of the new discoveries is about 130 miles northwesterly from the terminus of the White Pass railway at White Horse, which is the outfitting point.

As the first staking was done on the 4th of July by the Indians they named the creek on which the discovery was made "Fourth of July" creek.

Their arrival at White Horse for the purpose of recording was the signal for general stampede and in a few days the town was almost depopulated.

Following the discoveries on Fourth of July came others on Ruby, Alie, Twelfth of July, McKinley, Dixie, Marshal and Lamoreux creeks, which resulted in the recording of about one thousand claims, principally by White Horse residents. A few men started at once to prospect their claims by sinking to bedrock. Whipsawing lumber for sluice boxes, these men washed some of the gravel, which yielded fair prospects, but only one man—Bert Fowler—reached bedrock on "34 above Discovery" on Ruby creek. In a few days he took out about $300 in gold dust. The other claims prospected fairly well from the surface gravel down, but bedrock was too deep and water interfered so much with sinking that the owners returned to White Horse in October last, and some of them ordered machinery for thawing the grave and pumping. This machinery, some of which ha already arrived at White Horse, will be hauled out to the creeks during the coming winter, and next spring and summer there will be a pretty active camp.

Later in the season than the discovery of the creeks mentioned William Armstrong and party from White Horse crossed the divide into the Kluane Lake district to the west of Fourth of July and other creeks. They discovered placer gold on a river which empties

nto Kluane lake on the east shore, and still later, on the 24th of October, a party of prospectors arrived in White Horse bringing forty ounces of very coarse gold dust and small nnggets which they had recovered by sluicing on Bullion creek, a tribntary of Shins river, which empties into Kluane lake at the southwest limit. Conseqnently another stampede took place, participated in by abont 200 men, some of whom came from Skagway, and others from Atlin.

On "Discovery" claim on Bullion creek from which the gold dust was taken, the discoverers report that bedrock averages from 3 to 9 feet below the snrface. While the stampeders, many of whom have already returned to White Horse, not only confirm this statement, bnt assert that all along that creek, as well as on other tribntaries of Shins river, the bed rock is apparently shallow.

The accompanying map illnstrates the location of the several creeks which comprise the Alsek placer diggings. The topography of the conntry in the vicinity of Rnby, Fourth of Jnly and other creeks east of the divide, is comparatively level, and no high mountain ranges are sitnated in the near vicinity, but that portion contiguous to Kluane lake is described as mountainons, rngged, bare of timber and generally inhospitable. This is to be expected though, becanse while the more easterly camps are located at an average altitnde of about 8000 feet, and situated in the foothills and plateaus of the coast range of mountains, the westerly camps are situated in that range bnt east of the summit.

Large hay meadows are fouud along Rnby and some of the other creeks included in the earlier discoveries, as well as an abundance of fair sized timber, principally spruce, some of it 10 inches in diameter. But in the Kluane lake section, where the higher altitndes are reached, there is but very little timber.

The trail from White Horse is described as good. The ronte is from White Horse northwesterly to the Takeena river where the Northwest Monnted Police maintain a ferry; thence up the Takeena to the month of the Mendenhall, up that river and across the divide to the Dalton trail; theuce down the Dezadcosh river to Marshal creek, and thence nearly uorth to the other creeks, or westerly to the Klnane lake section. No high monntains have to be crossed, and timber for camping purposes is plentifnl and easy of access. The snmmer range for stock feed is reported as the best in the Yukon, and saddle and pack horses can be used on the trail the year round because road houses are beiug built in the vicinity of good hay meadows which will furnish a supply of winter feed.

The area over which anriferons gravel has beeu discovered covers abont 400 square miles.

Accessibility as a Factor in Mining and Related Business.

Written for the MINING AND SCIENTIFIC PRESS by CHARLES H. FITCH.

It was au old saying that "all roads lead to Rome," and for Europe it was well said, becanse Rome was the mother of road-building; roads meant Rome, and were built to serve Rome's pnrposes. The repntation gained by Julius Cæsar as a general who struck his blows before his opponents were ready to parry them was due in no small degree to the provision of roads reaching out like veins wherever the body of Roman power exteuded its growth.

In figuring on the profit (or loss) obtainable in getting values from a mine, cost of transportatiou ought to have its reasonable consideration. If the miue is 40 milcs from Sodaville, and "20 miles from any place," and the ore has to be packed over a trail, it has got to be worth much money to the ton to pay for itself, let alone making fortunes for the mine owner. It goes without saying that this is well understood by practical people, but people who bny stock on the strength of gold-beariug specimens do not in many cases understand it. To their minds $10 or $20 to the ton makes the appeal of so much cash on hand. We do not qnestion the honesty of legitimate promotion, nor the fortunes obtainable in hard actnal mining, bnt there is a saying which makes the mining man or promoter the snperlative of untruthful, even when he confines himself strictly to true statemeuts, telling half the trnth, the auspicious half. But do not merchauts and machinery men do likewise with the merits of what they have to sell, leaving the defects to be discovered after purchase, aud is not the complaint merely a matter of whose ox is gored? There are both deceivers who are trnc to the interests of those whom they entertain, and many more trnth-tellers who deceive, and up to a certain poiut the latter are the more popular class.

Bnt I did not intend to dwell upon inaccessible mines, or mines whose profits are inaccessible. My interests concern machinery, and the long, expensive road between the maker of a good thing and its pnrchaser. I was only yesterday at the shop of a man who has no end of mechanical cleverness, whose devices combine novelty and what we might call good horse seuse in mechanics. He had built and equipped a shop which bore the marks of his ability, being one of the neatest and best arranged shops of small size that I have ever inspected. He complained, however, that he had not enough for this pretty shop to do, which worried him some, as pretty shops eat their heads off the same as some which are less admirable and have fewer conveniences. He was making a device usefnl to all mechanics which could easily be shown to pay for itself in time aud labor-saving within a few months. He fignred out, and his figures could hardly be dispnted, a saving of 200% to 300% on the investment, a showing that could not be bettered by "get-rich-quick" concerns.

This proposition was like rich ore in the mine, and no road to it, bnt as Rome has roads to all Europe, the MINING AND SCIENTIFIC PRESS has subscription roads to all Westeru mines, and the best the manufacturer can do is to plant his works by advertisement on the line of these roads. This, of conrse, costs money, bnt it is as trne that it takes money to get business as it does that it takes a mine to make a mine.

If the device be a small bnt meritorions one it is a good plan to get it published in the catalognes of jobbers and dealers in snpplies. These charge a good commission, but it is contingent. There are no commissions nnless sales are made. With this help sales may be slow, but a rough road is better than none and may be all the bnsiness will bear. If our manufactnring mine in a good article is at all rich, however, it will pay to have a good road to it. A clear, effective picturc of the device shonld be kept pnblished in the jonrnal of the best reach. I came across an engineer recently who wanted a kind of steam trap, but had lost the address of the maker. It had been sold throngh some jobber who had removed the maker's name to block the direct road to him, and now the man did not know where it had come from. He looked in the engineering papers, but conld find no pictnre of it. As a matter of fact the jobber's advertisement was there, offering steam specialties, but the engineer did not know which jobber, and there was no pictnrc of the device. This is a common occnrrence amoug people who want things, aud the man who keeps an open road to his device will build np the trade therein.

But some mines are not rich enough to pay for keeping the road open. There are some devicces iu conuection with mining which are good in themselves, but which are not of snfficiently large demand, or do not carry a sufficient margin of profit to admit of their being exploited commercially. Perhaps they can be inclnded in a catalogne, or worked in connection with larger affairs, so that they will be specified in contracts, and something made ont of them on the side, but as leading propositious they cost more than they "come to."

We might cite ore and tailings samplers and mine signals as coming in this class. When the late H. L. Bridgman brought out his ore sampler, its compactuess and efficiency enabled a smelting conceru (Cia Metalnrgica Mexicana) to strike a large building from its plans. Its cost was saved many times to them. Bnt how did it "pan out" as a commercial proposition. It was sold at a good profit. The inventor offered a bonus of $100 extra to every salesman who should succeed in placing one of these machines. Quite a few were placed, bnt Mr. Bridgman told me that he speut more on foreign patents than his whole profits on the machines, and I thiuk that the manufactnrers spent more thau their profits in advertising it. Bnt it was a credit to them. It took the Scott prize of the Franklin Institute, and did good work.

When the Byrnes tailings sampler was brought out, the mannfacturer made an extravagant pledge of outlay in advertisement. My opinion was asked, and I said that I had seeu a long striug of good samplers, bnt had never seen any money made out of making and selling them. Perhaps the makers of the Scobey sampler or the Lamb sampler may have a different tale to tell, but I doubt it.

I recollect when H. C. Bacorn came East from Montana with his mine signal. It was a good thing, snccessfully installed iu several mines where he had friends and infinence. There it stopped. It was advertised, and "press-noticed," and catalogued, bnt practically none were sold. To sell a device of this kind required at least a visit to the mine, and a snrvey before an estimate conld be properly made, and the contingent expenses were disproportionate to the cost of the device. Introdnctory outlay was more than it wonld stand, and where signals were needed the mine manager was left to devise his own. We do not care to make a serions religions allnsion in an engineering article, but this analogy is too apt to be omitted. A Christian society for the conversiou of Jews had such slow success that the cost of every person of the latter faith converted was extravagantly large. So the cost of every mine manager converted to a system of signalling is likely to be so heavy as to be prohibitive. These things may be all right to be described, and nsed going on the free list, but there are no large fortnues to be made from them, and the margin derivable from proprietary rights in them is small. They are like $12 ore which costs $11 to concentrate and rednce, while there is not enough of it to make the dollar margin vastly profitable. The dollar profit is there as the gold is in the mine, bnt it is not conveniently accessible.

To Determine the Current Flow of an Electrical Circuit.

Written for the MINING AND SCIENTIFIC PRESS by WM. H. KRITZER, E. E.

If the cnrrent is of cousiderable strength, its direction can be ascertained by a compass needle or a small magnet suspended by a fine wire or thread. Place the condnctor (wire) so that its direction is approximately north and sonth., Let the observer face the north, and hold the compass or magnet jnst above the conductor.

If the north-pointing end of the needle or magnet is deflected to the right or east, the current is flowing north or going away from the observer; while if the sonth-pointing end is deflected to the right the currcnt is flowing south or coming toward the observer.

The positive wire of a circuit that has been iu nse for some length of time will have a darker appearance than the uegative, also a heavier deposit of dust upon it.

Cut several slips off a common blne print paper, moisten them iu water, and apply to the couductors of which it is desired to ascertain the polarity. In a few seconds the blue paper placed on the negative terminal will be bleached, the ferro-prnssiate of potash nsed in preparing the paper being decomposed, with the liberation of potash.

Another reliable method is to remove a portiou of the iusulation that covers the wires at ZZ iu Fig. 1,

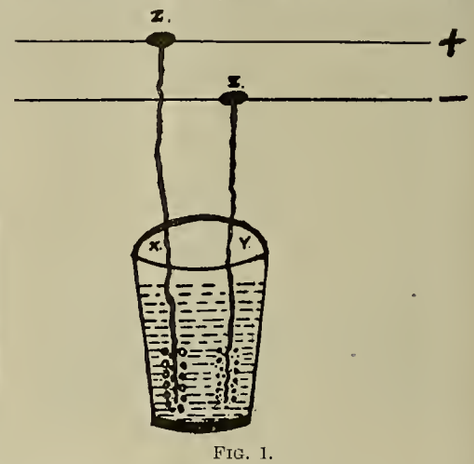


FIG. 1.

and attach pieces of insulated wire, leaving several inches of their free ends bare.

Place some water in a glass vessel, in which has been dissolved some common salt, or add several drops of sulphuric acid, if preferred. Dip the bare end of each wire that has been temporarily attached to the circnit into the water, aud observe which wire gives off bubbles or gas most freely. For example, if the one leading from X is found to do so, this is the positive wire. The gas given off by the + (positive) wire (or cathode) is inflammable, which may be proven by holding a lighted match over the bnbbles as they rise to the snrface. They will ignite with a minnte explosion. The wire is also very quickly corroded and eateu away by the action of the current.

Shonld only one wire of the circnit be accessible, attach two wires, as in Fig. 2, and, if safe to do so,

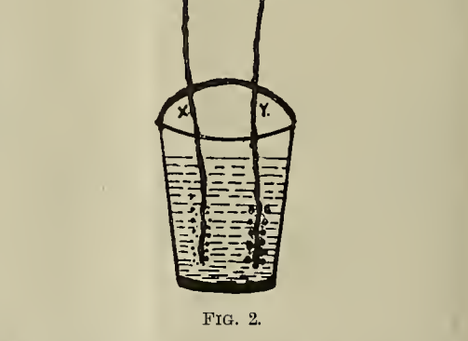

FIG. 2.

cut the circuit at A; bnt if dangerons, take the two wires as a shunt from the main condnctor and place the euds in a glass of acidnlated water, as before, and note which one acts as the + wire. We find that the wire Y does so, and, previonsly knowing the dynamo is located in the direction in which the tail of the arrow is pointiug, we know at once that the cnrrent in the conductor is flowing iu the direction in which the head of the arrow is pointing—away from the dynamo. It is apparent that this wire is the + portion of the circnit.

Underground Hoisting Problems on the Witwatersrand.*

Written by A. W. K. Peirce.

Gold mining on the Witwatersrand consists chiefly of the exploitation of the "main reef series," a bed of gold-bearing conglomerate with an east and west strike, and dipping to the south at a fairly uniform angle in the neighborhood of 30°. For an extent along the strike of 50 miles this reef series has been proved to be gold bearing, and the continuity of the deposit has been proved by actual mining and by bore holes to such a depth on the dip that mining ground is held at a high valuation even where the ultimate depth cannot be less than 8000 feet (vertical) or even more.

The permanence and the uniformity of average dimensions and values of these gold-bearing conglomerates make the mining in this area partake more of the nature of an industrial enterprise than is usual to mining ventures. This justifies the great attention that is paid to the engineering features of the work, and the large sums spent on the necessary mechanical equipment for the rapid and economical mining and reduction of the ore on a large scale.

According to the Transvaal mining laws, only the ore body contained vertically beneath the surface claim area can be mined by any given mining company. In order to exploit the ore contents of a mine situated at a distance from the outcrop, it is the practice, therefore, to sink one or more vertical shafts near the northern boundary of the property, to the intersection of the reef. This is then opened up by horizontal drives in the direction of the strike, and inclines along the dip; the principal inclines, in the most cases, being extensions of the vertical shafts. The ground thus opened up is stoped as required for the reduction plant, the development being kept ahead of these requirements sufficiently to permit of keeping up average values of the output, in spite of local variations in the gold contents of the ore body; and this process is continued until the payable ore body in the claim area is exhausted.

Where these vertical shafts are of moderate depth, the hoisting in both vertical and incline shafts is done by steam winders located on the surface, the vertical shaft being turned through a circular or parabolic curve into the incline. At greater depths, separate winders are used for the two sections (vertical and incline), but both located on the surface, the ropes for the incline hoists being led down the vertical compartments near one side, and suitably guided into the incline, the ore being transferred from one hoist to the other at the intersection of the two shafts.

Further extensions of the "deep levels" involve vertical shafts of 3500 to 5000 feet to the intersection of the reef, with inclines from this point of 3000 to 6000 or more feet in length; and in planning the development and equipment of these new properties, it is evident that present hoisting methods must be modified. A paper by H. C. Behr, entitled "Winding Plants for Great Depths," presented the various features of this hoisting problem, and in this paper and the ensuing discussion will be found a complete treatment of the matter from several points of view.

The concensus of opinion among South African engineers seems to be that these deep levels will be operated on an even larger scale than has obtained previously, the output planned for being 2000 to 3000 tons per mine per day; and that the greatest attention will be given to the economies that may be effected in working costs by the use of machinery, and in economic methods of operating the same. The advantages of electric power distribution are recognized, and this method will be extensively adopted for what may be termed auxiliary power requirements. This is not an inconsiderable amount; it may be from 500 to 1500 K.W. per mine, for surface requirements only.

The underground workings will be arranged with a view to rapid removal of the ore contents, and it is probable that several incline shafts, operated by independent winding engines located underground, will be used to feed each single large vertical shaft, the latter having several pairs of hoisting compartments, and possibly arranged for hoisting in stages. In any case, there will exist within the next few years a demand for hoisting engines of considerable size, to be located underground in a dozen or more of the deep level mines, and with from three to six hoists per mine.

As in several cases a number of these mines in the same neighborhood are controlled by the same financial interests, and will require their equipment at approximately the same period of time, it is feasible to consider the supply to such a group of mines of their electric power requirements from a single central power station; and if these requirements are to include the underground hoists I have mentioned, it is of interest to mention some of the conditions of the problem thus presented, and some of the conclusions that have been drawn therefrom.

The principal power requirements of the mine equipment and the area over which the power is to be distributed (this being several square miles, with an added distance of in the neighborhood of a mile for each transmission to any underground installation) practically determine the use of a polyphase system at a moderately high voltage, especially as the ratio of copper cost to power cost is about twice as great in the Transvaal as in most countries, thus rendering the use of small line losses desirable.

I think it is generally conceded that, for hoisting work on the scale indicated, direct current motors are more desirable than alternating. Their use in this instance, therefore, involves apparatus for converting the polyphase supply into direct current.

In spite of the losses and extra first cost involved in this conversion, it presents many important advantages in connection with the control system and the central station supply.

First, however, as to the nature of the power demand of such hoists as will be required.

The hoists will be of the double drum type, with clutches for each drum, and while they will be operated normally in balance, they must be capable of bringing up a fully loaded skip from the bottom with the other drum unclutched, i. e., without the balancing effect of the empty skip and its rope.

While for each particular installation the size of the hoists must be separately determined to suit varying local requirements with regard to degree of inclination, load to be hoisted, length of haul, etc., the following may be taken as representing the approximate limits, between which particular values will be taken to suit conditions:

Load of ore 5500 to 8000 pounds.
Hoisting speed 2000 to 3000 feet per minute.
Degree of inclination 25° to 45°.

A hoist to suit what may be taken as average conditions would demand 400 K. W. at the end of the acceleration period.

The hoists would be installed for an ultimate hoisting distance of perhaps 3500 feet along the incline (any longer inclines being equipped for hoisting in stages), but would only have 300 feet or so to haul when first installed. As the incline would be continued at the rate of about 100 feet per month, in about two and a half years the hoist would be working at its full capacity, and during most of this time would be operating under maximum conditions of load, the variables being the frequency and the duration of the trips, and possibly maximum speed if the control scheme be suitable.

Considering an individual normal trip, it is evident that the maximum torque required from the hoist motor occurs at the time of starting the loaded skip on its upward journey; for the acceleration is a maximum, the moment and friction of the ascending rope is also a maximum, and the balancing effect of the rope on the descending skip is a minimum. On completion of the acceleration period the effective torque still continues to decrease during the remainder of the trip, by reason of the winding up of the rope on the ascending skip and the corresponding unwinding of the rope on the descending skip.

The design of the hoist should not be such that this torque would become negative before the completion of the trip, as this would require the application of the brakes at this point to overcome all the inertia of the moving masses. It is obvious that this inertia should be utilized as far as possible to complete the last part of the trip, the brakes only being used to effect the final landing of the skip.

While similar in kind, the mechanics of this problem are quite different in degree to those of operating elevated railway trains, the relative value of the kinetic energy of the moving masses and the work done against friction and gravity being quite different in the two cases. Thus, with the limitations to hoisting speed imposed by practice, a considerable part of the trip must be made with power after the acceleration is completed, and the "coasting" period only exists for the few seconds required to bring the moving masses to a standstill.

In considering the demand on the generating plant occasioned by such a trip, the form of the acceleration curve to be adopted is of importance.

Obviously, if the available acceleration moment is fixed, maintaining the moment at a constant (maximum) value throughout the acceleration period gives a minimum duration of that period; but, as pointed out by Mr. Behr in his paper, an acceleration showing a constant decrease from the same maximum value to zero will give the same ultimate velocity in a certain space, and requires only 5% greater time than is needed to cover the same space with the same maximum velocity using an acceleration maintained constant at the maximum value.

The maximum power actually demanded by the hoist motor during a given trip depends upon the form of the acceleration curve, and is materially greater with constant acceleration than with constantly decreasing acceleration. The power demand being proportional to the product of the total torque and the speed at any instant during the period, it is evident that as the constant acceleration maintains the initial maximum torque until the maximum speed is reached, the power demand continually increases during the acceleration period, and at its end is a maximum. With a constantly decreasing acceleration, however, the maximum torque only occurs at minimum speed, and at maximum speed the acceleration torque is zero; therefore the maximum power demand occurs at some instant between these two points, and is but little greater than the power demand at full speed after acceleration ceases, which is that required for overcoming the effects of friction and gravity only. The actual amount of the work done is of course practically the same in either case.

It is evident that the constantly decreasing acceleration is much more favorable to the central station, in that it gives a better load factor, less fluctuation in the power demand, and requires less investment in generating plant, provided the method of control is such that the power demand from the source of power is proportional to the actual power demanded by the hoist motor.

The control system is thus the important factor in attempting to realize these advantages, as the decreasing acceleration is more normal for electric motor operation than the other; and for this purpose I know of no other method of control that is workable than some form of voltage control or Leonard system. Involving as this does some separate dynamo machinery for each motor installation, the advantage in control method previously referred to in connection with the conversion from the assumed polyphase distribution to direct current becomes apparent, in that this converter machinery may be utilized in one of a number of obvious ways to furnish the voltage control of the hoists.

This machinery also helps out the central station in another way, in that the inertia of its moving parts further smooths out the peaks in the demand curve during each trip; this effect may even be increased by the deliberate addition of inertia to the converter set in the form of a flywheel, as has been proposed by several Continental engineers that have investigated this problem.

The voltage control also possesses incidental advantages. The necessary slow speed inspection trips in the shaft may be readily made; during the first year or so of operation, the controller can readily be provided with adjustable stops limiting the maximum speed (consequently the maximum power demand) to whatever amount will give the desired output, and thus again improve the central station load factor; the controller need not handle the very considerable main current of the motors, thus eliminating a source of considerable first cost, and also maintenance cost; given positions of the controller handle result in nearly enough given speeds, irrespective of loads. These characteristics are so well known that it is perhaps superfluous to mention them here; I only wish to indicate that in almost every particular this problem is best met by this control scheme, which favorably affects both the source of the power and its utilization.

* Abstract Trans. Amer. Inst. Elct. Engrs.

A Sulphur Mine in Nevada.

George I. Adams of the United States Geological Survey has recently inspected a sulphur mine in Nevada and made an interesting collection of specimens which show that a good grade of sulphur is produced in this country and that we are not dependent on importations from Sicily to supply the demand. Only a few deposits in the United States are at present mined; but if a tariff were levied on the foreign product much greater development of native deposits might be expected. This is one of the industries that ought to be fostered. The investigations of the Survey were made for the purpose of ascertaining the nature and extent of the Nevada deposits.

The mine visited by Mr. Adams belongs to the Nevada Sulphur Mine Co. It is situated in the Rabbit Hole mining district, just northwest of Rabbit Hole Springs, 35 miles from Humboldt House station on the Southern Pacific Railway, on the edge of the Black Rock desert, a desolate volcanic region in which there is little rest to the eye or cheer to the spirit. The mines are in the form of pits, open cuts and drifts.

This deposit was discovered about thirty-five years ago by an Indian, who sold it for a horse and saddle that he never received. In 1874 the mine was worked by white men.

The Nevada Sulphur Mine Co. began work in 1900. The new company started with only one retort, but have since added another. These retorts are cylindrical iron structures somewhat resembling a blast furnace in general appearance. After the ore is dumped into them they are closed and superheated steam is then turned on. The sulphur melts and runs out of the bottom of the retort into a settling pan, from which it is drawn into molds. The forms in these molds weigh about 250 pounds. After they have cooled, they are crushed to pea size or ground with buhrstones into flour.

The sulphur of pea size is shipped in 100-pound sacks, the flour in 110-pound sacks.

Where the sulphur has taken crystalline form, it looks bright and sparkling, its yellow crystals often beautifully tinted with rosy cinnabar. The richer deposits are the dark, massive ones, which look like solid walls of brimstone.

Mr. Adams will write a report on the mine, to be included in the Survey's yearly volume on "Economic Geology."

Notes on Quartz Milling on the Rand.*

Discussion of paper by FRASER ALEXANDER.

I. Roskelley: With regard to Mr. Edwards' first question in reference to the rate of feeding ore into the mortar, I am nnable to give any definite answer to this question, since the rate of feeding must depend on the rate that the crnshed prodnct passes through the screen. The feed shonld be kept low and the discharge should also be low, say from 2 to 3 inches. The crushed ore bronght to the mill should not be larger than 2-inch cnbes, for on the size of the ore depends, to a great extent, the efficiency of the mill. This is a point to which not nearly enough attention has been given on these gold fields. The crnsher is the proper machine for breaking up big rock, and if the work is not done there the damage done to the mill itself is almost endless—mortar boxes are choked, feeders get broken, and the duty of the mill is lowered. When the ore has been properly brokeu np before being brought to the mill the dnty is increased by about a quarter of a ton per day per stamp. This, in a 200-stamp mill, means an increase of 50 tons per day. Hence, taking the duty per stamp at 5 tons, proper crushiug is eqnivalent to an increase of ten stamps.

Mr. Edwards wants to know what quantity of water shonld be used per stamp per twenty-four hours. This, again, is conditional. It depends on the duty of the stamp, the mesh screen used, and the fall given to the plates. The following are the results obtained in the Robinson Deep mill under varyiug conditions:

Fall of Plate.	Screens, Standard.	Tons Crushed per Stamp per 24 Hrs.	Slimes Collected.	Height of Drops.	Speed Drops per Minute.	Height of Discharge.	Water Used per Ton of Rock Crushed.
Inch per Foot.			%.	Inches.		Inches.	Tons.
1 1-16	600	5.45	25.4	8½	96	2½	6
1 1-16	700	5.28	29.0	8½	96	2½	6
1 1-16	900	5.07	31.8	8½	96	2½	6½
1 1-16	1000	5.06	35.3	7½	100	2½	7
1 1-16	1200	4.95	35.0	7½	100	2½	7½

Referring to the use of lime, should the plates show discoloration a little lime may be used, but not otherwisc. An excess of lime would, I think, affect the efficiency of the plates.

DISCHARGE.—I certainly do advise the general adoption of a low discharge, since I do not believe iu inside amalgamation. I can see no reason why the pulp should not leave the box immediately it is crushed to the reqnisite degree of fineness, and a high discharge is nnfavorable to this, siuce the pulp is splashed about the box instead of against the screen. Did I recommend iuside amalgamation I should favor a high discharge, since this splashing would be what I should aim at getting.

C. H. Pead: I wish to state the fact that all our later experience goes to show that the gold left in the sand residues is, except for a very small portion, due entirely to the condition in which the pulp is received from the mill, for the gold, being enclosed in insnfficiently crushed particles of pyrites, is, to quote Mr. Tavener, "not accessible."

Mr. Crosse has stated that all our gold since reaching the blue ground is associated with the pyrites. Mr. Denuy has shown that if the pyrites be crushed fine enough wonderful extractions may be obtained from them by cyanide treatment, and I fully indorse this statement. This being the case, it is inevitable that this fine crushiug must by some means be done, aud when it has been achieved the residue values, now ranging from 1 dwt. to 1.5 dwt. per tou on the Rand, will, I believe, be brought down to from 0.3 dwt. to 0.5 dwt. per ton.

As to how this fi e crushing is to be done, there seem to be almost as many opinions as there are experts, but I think it will be geuerally admitted that the finer crushing of the pyritic portion of our rock is the point to be aimed at.

From experiments made by Mr. Crosse and myself at the East Rand Proprietary miues—where the milling conditions are as follows: Stamps 1250 pounds, drop 8 inches to 8½ inches, discharge 2 inches, screen 700 mesh, speed 98 drops, water 6 tons per ton of rock, feed light—it has been found that, of the pyrites in the rock, from 40% to 50% of it has been insufficiently crnshed to give np its gold contents to anything like a complete extent, and that further crushing causes this inaccessible gold to be readily dissolved by the ordinary cyanide treatment.

The proposition before us, then, seems to be to crush the pyrites as much finer as we can contrive to do during the first crushing in the mortar boxes without undnly crushing the siliceons portiou of the rock, and without lowering the duty per stamp, to collect mechanically the pyrites which may still remaiu insufficiently crushed, to regrind it to a suitable size and treat by cyanide in the ordinary way.

Mr. Crosse has often told me he would like to make the mortar boxes act as mnch like spitzlntteu as possible, and I think he is right, bnt it is evideut that they will never act thns while the water is led into them at the top, and I believe if it were introduced lower down, even, perhaps, through the bottom, much better results might be obtained. Of course, the discharge would have to be considerably raised and a much coarser screen used, or, perhaps, even none at all. In this connection it wonld be of the first importance that the water supplied to the mill come from a steady head tank through pipes of snfficient size to allow of effective pressure at any part of the mill, and the snpply must not serve as a general main to provide water for other purposes besides milling. The results to be obtained by some such plan wonld, I think, be higher dnty and more gold recovered.

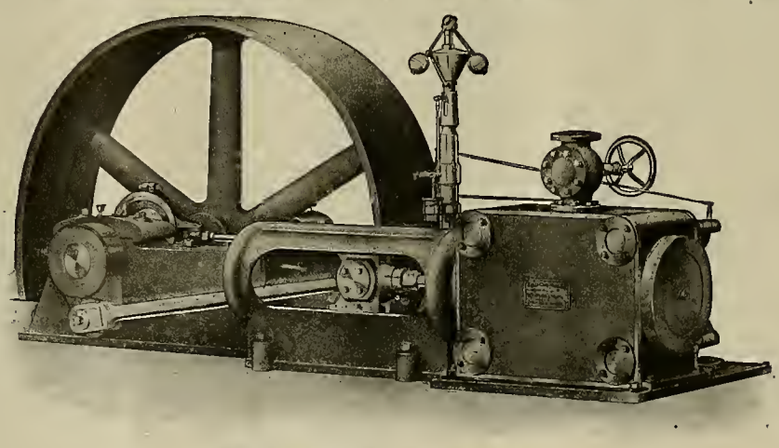
While on the subject of stamp duty, I notice Mr. Alexander gives an instance where with 1000-mesh screen and 6-inch discharge a duty of 5.5 tons per stamp per day is obtained, and J. R. Williams mentions that among the compai ies with which he is connected the mill using the finest screen crushes the most rock. I shonld like to ask if there is any special reason why with so fine a screen such an excellent tonnage is obtained—whether, for instance, the rock is unnsually easy to crush, or whether some special system of milling not usnally adopted on these fields is the cause of this success? I feel sure that either of the gentlemen I have mentioned will gladly assist us to an improvement, and, I think, we must admit that, as a rule, the use of finer screening has resulted in less tonnage being pnt through the mills.

Mr. Alexander also gives us the relation between height of discharge and size of screen, reducing he height as he increases the size of his screen. I cannot in the least understand how he arrives at his figures, for the reverse seems to me to be the natural order of things, unless the mill duty is to go all to pieces. For instance, keeping a nniform size of screeu and raising the chuck block I shall expect the dnty to fall more or less in proportion to the rise in discharge, and with every increase in the size of the screen I should expect the dnty to rise. Therefore, I should have looked for a low chuck with a fine screen and a higher chuck with a coarser screen, whereas Mr. Alexander advocates the reverse.

With regard to amalgamation, Mr. Alexander advocates an unrippled flow from start to finish over the plates. I know snch a condition of things has been established in these fields, chiefly, I believe, for convenience in work. But is an nnrippled flow the best for amalgamation? It has often seemed to me that the pulp traveling over so smooth an inclined plane does not turu over enough, and may easily bear np particles of free gold in such a position that no contact with the plates is possible. We can, many of us, remember the old-fashioned step plates, and these, I am told, are still used in Australia, and that the results obtained with them are excellent. Perhaps bnt for the introduction of the cyanide process we should still be nsing them here.

(TO BE CONTINUED.)

*Abstract Jour. Chem., Met. and Min. Soc., S. A.



New Standard Reynolds Corliss Engine.

Herewith is illustrated a new Corliss engine which is being bronght out by the Allis-Chalmers Co. from the designs of Irving H. Reynolds. The field of Corliss engine design has been so fully worked over in the past, and the accepted designs have become so simple, that no strikingly novel designs are to be expected. The present machine, however, represeuts the experience of twenty-six years in buildiug of Corliss eugines. Engines of the type illnstrated are being built in seveu sizes, rangiug from 50 to 500 H. P., and are desigued for steam pressure np to 150 pounds. They are bnilt of somewhat shorter strokes than have heretofore been customary in Corliss engines, with the idea of economizing in space and making the construction more rigid. The speeds are also somewhat higher thau usnal, rangiug from 110 to 150 revolutions per minute, although these speeds are not higher than those at which the Reynolds-Corliss engines of older design are frequently operated. The frame is cast in one piece with the slide, the construction being of the box type, resting on its foundation for its entire length. The main bearing shells are bored into the frame, thus insnring a solid bearing and also permitting the easy removal of the shells by rolling them ont around the shaft. The slide is of the barrel type with bored guides. The crosshead is fitted with babbitt faced shoes with wedge adjustment. The piston rod is screwed into the crosshead and held firmly with a steel lock nut. The cylinder is of the round cornered type, is fitted with double ported steam and exhaust valves, lagged with planished steel. The cylinder is set on a cast iron base plate, which extends under the valve gear, serving as a drip pan.

The valve gear is of the nsual Reynolds-Corliss type, the wrist plate beiug of skeleton pattern and fitted with a new type of disconnecting device which, while clamping the hook rod firmly, is easily detached by hand. The dash pots are of differential plunger type without leathers or packing of any kind. The regulator is of the high speed weighted type, designed to control the engine within narrow limits of speed variation. The connecting rod is of steel with solid forged ends, fitted with bronze boxes, babbitt lined on the crank pin ends, the boxes being adjnstable by means of screw actuated wedges. The crank is of plain type, polished on the face, and is protected by a planished steel oil guard (not shown in cnt).

The engines are fitted either with belt flywheels, as shown, or with square rim wheels where used with direct connected electric generators. The crank and crosshead pins and main journals are of a size ordinarily nsed with heavy duty engines.

The manufacturers say that "the engine is strong, simple and compact, and while nothing has been added for oruamentation, nothing contributing to economy or durability has been omitted, and the machine should find a large sale among power users who appreciate quality."

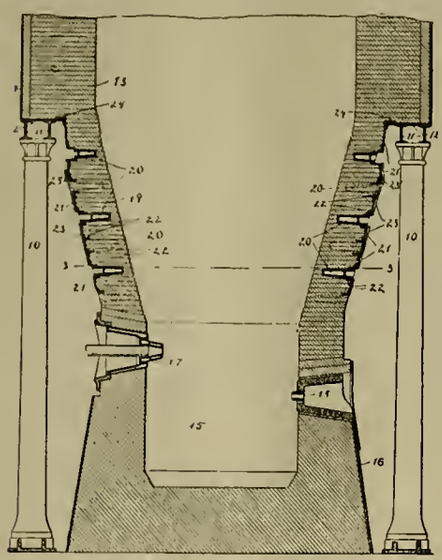
New Standard Reynolds Corliss Engine.

Refining Silver in British Columbia.

A shipment of 85,000 ounces of silver 900 fine was recently made to the United States Mint at San Francisco, says the Mining Record, for shipment to the Philippines, representing the product from the smeltiug of British Columbian lead ores at Trail, refining the resulting bullion by the electrolytic lead process, which has for many months past beeu supplying Eastern Canada with commercial pig lead.

When the electrolytic lead refinery was first operated the "silver slimes" (composed of the precious metals and all the impurities, such as copper, antimony, arsenic, etc.) were sold to United States refineries, where the actual separation of the precious metals from the impurities was made. As there were no plants in operation prepared to economically handle this particnlar product, which differs somewhat from the slimes produced from electrolytic copper refining, it was decided to bnild a special plant at Trail for the purpose of making a complete separation of the precious metals and impurities, which will make, in connection with the electrolytic lead process and the smelting works, a complete works for the treatment of all lead-silver ores and the productiou therefrom of pure lead, fine silver, fine gold, copper sulphate, and probably later, metallic antimony.

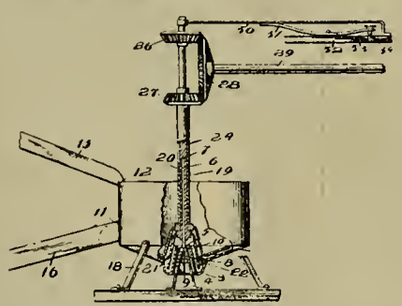
The first shipment of abont 300 ounces of gold which was over 995 fine was made to the United States Assay Office at Seattle a few weeks ago, and a second shipment of about 700 ounces of gold was made shortly thereafter to the same place.



FORMERLY it was the custom to operate machiue drills nnder a pressure of 60 to 70 pounds per square inch, but the pressure has beeu increased to 90 or 100 ponnds, and, although the wear on the drill is greater, the additional work accomplished is more than commensurate.

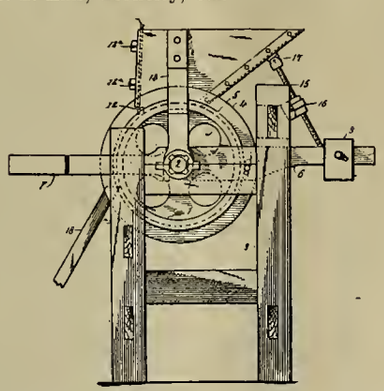
Mining and Metallurgical Patents.

PATENTS ISSUED NOVEMBER 24, 1903.



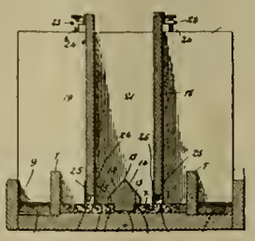
Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

SUPPORT FOR COOLING PLATES OR COILS IN BLAST FURNACES.—No. 744,319; A. Farrell, Gladstone, Mich.



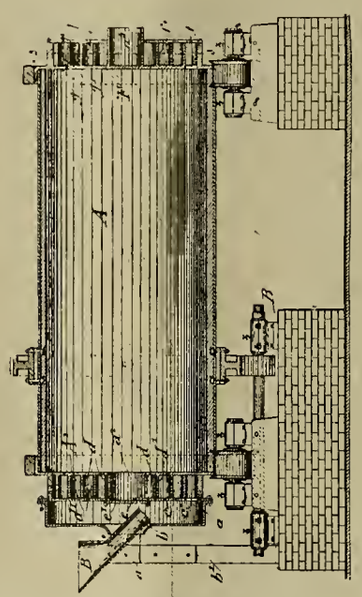
Blast furnace having metal frame encircling its bosh wall and provided with series of cooling plates or coils extending inwardly from frame, and means for securing outer portion of cooling plates or coils to frame in manner permitting plates or coils to be removed without disturbing frame.

AMALGAMATOR AND CONCENTRATOR.—No. 744,687; T. B. Lee, Hesperus, Colo.



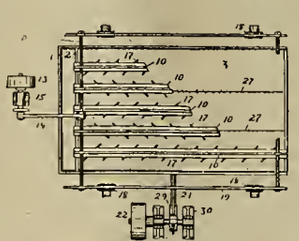
In amalgamator and concentrator vessel having bottom and amalgamating pocket depending therefrom, revolnble stirrers to operate on bottom and in pocket, and vessel carried by stirrer in pocket having means to feed chemical therefrom; revoluble shaft vertically disposed, having stirrer to operate in vessel; tubular shaft on first mentioned shaft having stirrer to operate in vessel; reversely disposed gears on shaft and tnbular shaft; a driving gear engaging gears to simultaneously reversely rotate same.

FEED REGULATOR FOR ORE FEEDERS.—No. 745,169; C. Z. Ellis, Berkeley, Cal.



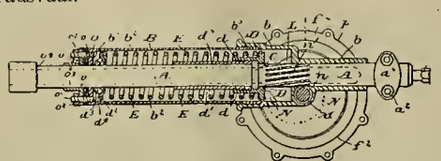
In ore feeder, frame, cylinder mounted to rotate in frame, annular flanges at the ends of cylinder, cylindrical ledges at outer sides of flanges, levers mounted to rock at opposite ends of cylinder, blocks carried by levers and extended across cylindrical ledges, sides of blocks adjacent to ledges being inclined upward and outward, series of bearing balls arranged between blocks and ledges, balls being of varying diameters and hopper arranged above cylinder.

AMALGAMATOR.—No. 745,047; G. Fletcher, C. E. Davis and B. T. Douglass, St. Clair, Nev.



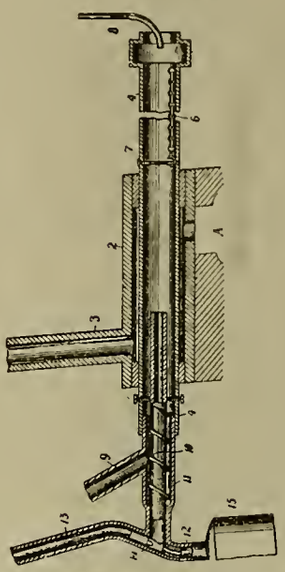
Amalgamator comprising casing having qnicksilver pit and pressure chamber directly over pit, vertical amalgamating plates disposed in pairs at opposite sides of pressnre chamber and each plate extending below qnicksilver level in pit, plates of each pair being disposed in parallel relation and forming intermediate space in which anriferous material is free to distribute itself after passing one plate and before passing remaining plate of pair, and beveled divider extending upwardly from bottom of pressnre chamber and between adjacent members of pairs of plates.

TUBULAR BALL MILL.—No. 744,451; M. F. Abbe, New York, N. Y.



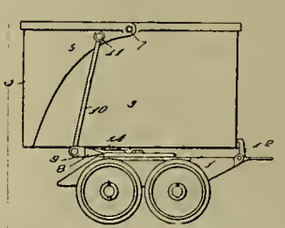
In grinding mill, combination with horizontal cylinder rotatably mounted, of feed chamber at front end thereof, partition wall dividing feed chamber into two compartments and provided with segmental opening at circumference, hopper extending into front compartment, and spiral feedway in other compartment for feeding material passing through segmental opening of partition plate into cylinder.

MACHINE FOR RECOVERING MERCURY AND AMALGAM FROM ORES.—No. 744,759; T. H. Hicks, Fort Wayne, Ind.



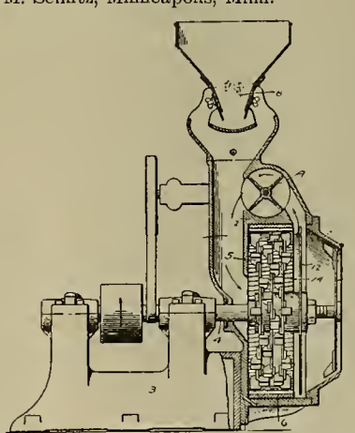
Reciprocating pan having amalgamated lining and adapted to contain ore and water; amalgamated joints in lining for passage of snperfinons mercury, and means to agitate ore.

ELECTRICAL ROCK DRILL OR ROCK DRILLING MACHINE.—No. 744,912; A. H. Gibson, Krugersdorp, Transvaal.



In rock drill, in combination, drill bar A, collar or annular projection C formed thereon, circular tappet or disk D mounted concentrically on bar A and free to rotate thereon and bearing against one side of collar C, boss d of tappet and bearing sleeve d' screwed into boss d to reciprocate drill bar as tappet is moved in path parallel to longitudinal axis of bar while permitting it to revolve freely, spiral spring E arranged concentrically around drill bar and bearing against tappet at one end, and ball-bearing collar interposed between other end of spring and drill case.

ROASTING FURNACE ATTACHMENT.—No. 744,992; D. D. Bailey and J. O. Bailey, Banner, Cal.



Combination in ore roasting apparatus of furnace having inclined discharge flue, pipe extending substantially central through flue and through furnace, device for feeding ore through pipe, extension of pipe beyond furnace, and amalgamating device carried upon discharge end of pipe.

ORE CAR.—No. 745,113; G. G. Newcomb, Denver, Colo.

In ore car combination with rotatably mounted support of car body pivoted thereto formed with a discharge opening, gate closing opening, webs formed on gate inclosing portion of body pivotally engaging same, and link connecting rotatably mounted support with one of webs.

CORRUGATED LINING FOR PULVERIZERS.—No. 745,075; J. M. Schutz, Minneapolis, Minn.

A pulverizer or grinding mill comprising cylindrical casing in combination with corrugated ring or lining provided therein and having internal inclined corrugations, ring being shorter than casing; shaft, beaters provided thereon, disk 12 carried by shaft and located between end of ring and end of casing; return duct, feed trunk, separator cone 10 and end disk 11 thereof.

PROCESS FOR DESULPHURIZING SULPHUR-BEARING PETROLEUM.—No. 744,720; T. F. Colin, Elizabeth, N. J.

Process of desulphurizing petroleum and its distillates by treating them with aqueous solution of iron sulphate, sodium chloride and copper sulphate.

Mining Summary.

SPECIALLY COMPILED AND REPORTED FOR THE MINING AND SCIENTIFIC PRESS.

The annual report of Director Roberts of the United States Mint Bureau shows that the mints at Philadelphia, New Orleans and San Francisco were in operation during the year and that the output was greater in number of pieces than in any previous year, aggregating 205,872,482. The pressure for small domestic coins and for Philippine coins reduced the aggregate of gold coinage to $45,721,733, and the stock of gold bullion in the mints increased from $124,083,823 to $157,511,571. This bullion is included in all figures of Treasury reserves. The net gains in the gold stock of the country during the year is estimated to have been $57,157,149.

Of the silver bullion bought for dollar coinage under Act of July 14, 1890, 33,218,712 fine ounces were on hand at the beginning of the year and 17,502,938 at the close of the year. This amount will be entirely exhausted during the current fiscal year. No other provision exists for the coinage of dollars or subsidiary silver coin.

The total deposits of gold bullion at the offices of the Mint service during the year were of the value of $127,004,443.——A summary of all earnings and expenditures, including seigniorage on silver and minor coin, shows that the total earnings and gains exceed expenditures by $6,897,323, the total earnings having been $8,698,510 and the expenditures $1,801,187.——It is announced the new coinage mint at Denver, Colo., will be ready for equipment during the coming year.

D. Phillips, U. S. Consul at Cardiff, has forwarded to the State Department at Washington, D. C., statistics relative to the coal industries of the world. Figures are given showing the production of coal in the five principal coal-producing nations in 1902, as compared with 1901, as follows: United Kingdom, 227,095,000 tons; increase 8,048,000 tons; United States, 268,688,000 tons; increase, 6,814,000; Germany, 107,436,000 tons; decrease, 1,103,000 tons; France, 29,574,000 tons; decrease, 2,060,000 tons; Belgium, 22,769,000 tons; increase, 556,000 tons. The total known production of the world is stated to be about 700,000,000 tons.

The excess of exports over imports in 1902 in the three leading coal-producing countries is shown to be as follows: United Kingdom, 60,397,000; Germany, 12,111,000: United States, 2,583,000.

The following figures are given showing the excess of imports of the chief coal-importing countries: France, 13,017,000; Austria-Hungary, 5,388,000; Russia, 3,643,000; Sweden, 2,793,000; Canada, 2,627,000; Spain, 2,151,000.

The following figures are given to show the consumption of coal in 1902 in the countries named: United States, 265,105,000 tons; United Kingdom, 166,698,000; Germany, 95,325,000; France, 42,195,000.

ALASKA.

Judge Wickersham, on the 28th ult., gave his opinion confirming the title of the Alaska Copper Co. to the complete and undisputed ownership of the Bonanza mines in the Copper river section, near Valdez. It is expected the building of the road will result, as the Havemeyers of New York are said to be of the company. The question as to titles of the properties arose through a misunderstanding over grubstake rights.

C. Whitehead of the Alaska Bank & Safe Deposit Co. reports the gold production of the Nome region for the season just closed estimated at $6,000,000. This is an increase of half a million dollars over the production of 1902, and an increase of $1,500,000 over 1901.

The final cleanup of the 300-stamp mill of the Alaska-Treadwell mine, on Douglas island, was made last week, and operations have ceased. It is not expected to start up again before spring, says the Juneau Record-Miner.

ARIZONA.

Cochise County.

The oil-burner smelter at Benson, which has been under construction during the past year, is completed, and is expected to be put in operation this week. The Smelter Co. last week struck artesian water at depth of 250 feet, and it is expected to supply all the water necessary for the operation of the plant.

Developments by the Tombstone Con. M. Co., Ltd., at Tombstone, are progressing. The work of unwatering is going successfully. The ground has been sufficiently drained to permit of sinking winzes on the veins at distances of several hundred feet from the shaft and shipping ore has been struck at points below water level. The ore is found to carry more lead than that from above water. Increasing shipments are being made, the present rate being three cars a day. The amount of water being pumped daily is 2,250,000 gallons, which is sufficient to drain the ground, but not as fast as desirable, and two additional pumps have been set up on the 700-foot level which will permit of doubling the rate of pumping if necessary. An additional boiler of 200 H. P. has also been put in, making a total of 1000 H. P. available at the drainage shaft.

Gila County.

Suit has been brought by G. Elliot of Boston, Mass., in New Jersey courts, to restrain the consolidation of the Old Dominion C. M. & S. Co. at Globe and the United Globe mines, and a temporary injunction granted.

R. Fleming has secured a two years' working bond on the McNelly & Crowley group of copper mines on Middle Pinto creek, near Globe, and will begin development in January. It is intended to develop the property by sinking a shaft several hundred feet and opening up the lead by drifts and crosscuts. The McNelly & Crowley is a group of nine mining claims and a millsite. About 1400 feet of development work has been done. The ores carry copper and gold values.

Graham County.

Work was resumed on the Antietam mine, near Metcalf, last week, and arrangements have been made to ship ore to the Arizona C. Co. for treatment, says P. F. Crowley, manager of the mine. A burro pack train will carry the ore to the railroad at Metcalf.

The Humboldt tunnel, near Morenci, is being widened to receive six-ton cars, as they propose to increase the output of the mine.

At the Sierra de Oro mine, near Clifton, in their tunnel, last week, a 3-foot vein of ore was struck which averages $15 in gold, 9% lead and 2% copper, says the Copper Era. Manager Potter says this lead does not apex on the surface.

Maricopa County.

(Special Correspondence).—A bottling works has been established in Phœnix to supply the trade with mineral water from the springs near Goddard's. A mineral paste which is said to possess medicinal virtue is found near the springs.

La Gloria M. Co. is working sixty men on its property in the White Tank mountains, west of Phœnix.

Mills & Philes, in the Cave Creek district, are taking out high-grade ore. It will be shipped to a smelter.

Phœnix, Nov. 30.

Mohave County.

Arrangements have been made for resuming work on the Elkhart mine by the reorganized company, with J. P. Finegan of Chloride, resident manager, and Tom McGraw superintendent.

It is reported the Infallible and Star Spangled Banner mines, at Stockton Hill, have been sold to W. S. Fletcher of Pinal county. An adit 700 feet in length tapping the vein 250 feet from the apex has been run on the Infallible, while a drift several hundred feet in length has been run on the vein of the Star Spangled Banner. These drifts have been connected by shaft with the apex of the veins, giving them ventilation, says the Mohave Miner. They have produced gold, and silver-lead ores. W. A. Mensch will be resident manager.

The water is being pumped from the C. O. D. mine, near Kingman, and a deal for the mine is said to be pending. The C. O. D. is in Wallapai mining district, and has produced gold-silver ore.

It is reported that the New Comstock M. Co. has bonded its mines and mill, near Kingman, to Swan & Son. A short line of railroad connecting the mine with the mill will be built and a hoisting plant set up on the Katherine mine, says the Mohave County Miner.

The hoisting plant for the De la Fountaine mine at Stockton hill is being set up in the drift and the shaft will be sunk to water level. The shaft is 300 feet from the portal, and through this drift all waste and ore will be discharged until water in sufficient quantity to require a pumping plant is struck, which is expected to be within 200 feet below the level of the drift. The mine shows bodies of lead and zinc ores.

Pinal County.

(Special Correspondence).—The Pinal Paraffine Oil Co. has completed the casing of its well in Hackberry wash, near Kelvin, and has resumed drilling. Indications of oil have been struck. The well is down 1217 feet.

Phœnix, Nov. 30.

Owing to fall in price of molybdenum, the C. H. Udell concentrating plant at Mammoth has been shut down, pending recovery in the market price of the metal, reports Manager Udell, who has been operating this plant in extracting molybdenite from the Mammoth mill tailings.

Yavapai County.

The Prescott-Arizona G. M. Co. is putting in machinery at its mine near Hillside. The power dry washer is expected to be in operation this month. The company has both quartz and placer claims, says President J. T. Pendegast.

In the mines of the Octave camp there are 150 men at work.

At Big Bug the Jessie M. Co. is enlarging the shaft to a double compartment. This shaft is down 657 feet. A hoisting plant with capacity for 2000 feet and a five drill air compressor are on the ground ready to be set up. A mill of 200 tons daily capacity will be built adjoining the shaft house.

At the Henrietta mine, near Big Bug, the Braganza M. Co. has let a contract to drive a tunnel from the level of the tram at the mill through the mountain for a distance of 2800 feet. This tunnel will follow the Henrietta lead at the beginning of the work, and when completed will connect with the shaft on the opposite side of the mountain with shaft No. 2. Direct communication will be had between the mine and the mill, and tramming will be reduced to a minimum, says Superintendent J. T. McLaughlin.

F. E. Biles, vice-president and manager of the Dividend M. Co., operating near Big Bug, says they propose to build a 40-stamp mill in addition to the 5-stamp already in operation. They will establish a power house in Eugenia gulch, 1 mile distant, and from that point electrical power will be furnished for all mining, milling and lighting purposes.——The Merchant's M. Co., in the same section, has its main shaft down 300 feet, and the work is progressing on the First Home claim of the group. At the level at this point a body of milling ore has been struck. It is proposed to build a concentrating plant on the ground.

J. J. Brooks will begin development work on the Bodie Extension group, near Prescott, this week.

The Journal-Miner says preparations are being made to resume work on a larger scale on the Leland group in Chaparral district, near McCabe.

Yuma County.

Quinn & Scales are working their Hercules group, 1 mile north from their 10-stamp mill at Harrisburg. Quinn is also working a claim south and adjoining the Bonanza mine.

CALIFORNIA.

Amador County.

The cleanup made last week at the Fremont Con. mill, near Amador City, is reported to have averaged $5 per ton for the first run. The ore was a mixture of rock from several levels.

At the Argonaut mine at Jackson the shaft repairs have been completed below the 1200-foot level. The mine is expected to be in full operation early in the spring.

Butte County.

The American Dredge Co. is building a dredger on the east side of Feather river 5 miles below Oroville.

The Cherokee mine at Cherokee has been reopened by the hydraulic process. Superintendent Vinton has fifteen men at work and the number will be increased.

Calaveras County.

Last week a number of the mines in and around Angels started up again, as there is plenty of water to keep them in operation. The list includes the Sultana, the Angels, the Oriole, the Gold Cliff and the Madison mill. At the Cross shaft of the Utica G. M. Co. water was turned on instead of steam; repair work is being done at this shaft, while at the Madison shaft the water is being pumped out, preparatory to development work, says the Angels Record. There were 500 men put to work during the week. The outside mines are preparing for work, and the Calaveras mine, on Indian creek, is putting in an engine.——The '49 gravel mine at Douglass Flat has resumed, and the water is being pumped out.——At the Eho mine, 3 miles east of Murphys, water for hydraulicking is being piped from the Utica ditch. During the past year a tunnel 130 feet long was run and two drifts made; powder was put in and exploded, tearing down the side of the hill, so that the hydraulic work can be carried on.

Operations are resuming at the Welsh gold mine, near Copperopolis.

The Angels Record reports that forty additional stamps are to be added to the 60-stamp mill at the Melones mine this winter.

The Salvator mine and mill, near Railroad Flat, is again in full operation. Owing to shortage of water for the past four months, milling could not be carried on. The 8-stamp mill is crushing ore. The property consists of three full claims on the lead, on south bank of Esperanza creek. The mill is on Esperanza creek at mouth of tunnel No. 1, and is run by free water from the creek, which they have eight months of the year. The mine is developed by tunnels on the vein. No. 1 from mill is in 950 feet, showing a milling ore body, with sboots at intervals. On one shoot a raise is up 300 feet to tunnel No 2, which is being extended. Also a winze is being sunk on shoot on floor of tunnel No. 2. H. C. Newman is superintendent.

A union of the miners having been formed at Hodson, a demand was made of the Royal Con. M. Co. last week that the men be given $3 per day, that the union be recognized and that the men be allowed to board and trade where they please. Up to the present time the men have been required to board and trade at the company boarding houses and deal at the company stores. This was refused and the company has closed the mines, throwing 200 men out of employment, 100 being union miners. The company recently started a new shaft near the old 40-stamp mill, but the work has been abandoned, as well as all other work. The 120-stamp mill has been in operation since summer.

El Dorado County.

At the Havilah mine, 8 miles from Plymouth, Amador Co., across the Cosumnes river, Superintendent O. R. Allen says the shaft has been sunk to 800 feet in depth and other developments made. More machinery will be put in at the top workings.

It is reported that Superintendent B. Peters of the Lady Emma mine, near Kelsey, has completed the 2-stamp mill at the mine.

The steam hoist is in operation at the Eureka-Woodside mine, near Georgetown, and Superintendent Everson has two shifts at work. The triple-compartment shaft is down 80 feet.

Fresno County.

The first well of the Pleasant Valley Stock Co., near Coalinga, has been finished, and is flowing at rate of 250 barrels per day of 18° gravity oil. Well No. 2 is over 900 feet deep.

Section Seven Oil Co., well No. 1, at Coalinga, continues production averaging 1200 barrels per day. Since it was tubed and packed, the flow has been steady without any indication of lessening, says the Reporter.

The last well that has been pumped by means of a jack on the west side, at Coalinga, is No. 3 of McClurg & Claypool. It has been changed back to be pumped with the beam. It has been shown by various companies that the production can be increased from ¼ to ½ by pumping a well with the beam instead of jacks.

Inyo County.

Work is reported progressing on the mill and cyanide plant of the Millspaugh M. & M. Co. at Millspaugh.

Kern County.

(Special Correspondence).—The Hamilton mine, 8 miles from Rosamond, is down to the 300-foot level, with free milling ore averaging $5.28 per ton. Manager Staverken will build a 100-ton plant. The ore will be cyanided.

Rosamond, Dec. 1.

F. H. Heald of Los Angeles, part owner of the coal mines near Garlock, says a diamond drill will be used to thoroughly test the mine.

The Karma M. Co., near Mojave, has its 20-stamp mill building up and is putting in the machinery and stamps. Equipment for cyaniding is also being installed.

The hoist at the Sunshine mine, near Randsburg, has been set up and is now in operation.——Superintendent Morrison of the St. Elmo mine reports he has resumed operations with one shift at work.

Nevada County.

Five more stamps are being added to five set up at the Zeibright mill, near the Placer county line, south of Grass Valley, by the Zeibright M. Co. of Nevada City. The work of laying 1500 feet of pipe to connect the South Yuha ditch with the mill is in progress, and when completed will give a head of 400 feet.

Preliminary work is under way at the Osceola mine, near Rough and Ready, bonded by Enzensperger & Waterfield. The mine was formerly worked through a tunnel, but they will sink a shaft.

The Town Talk mine, on Howard Hill, near Grass Valley, will resume operations, says the Tidings. Work has been suspended for the past five months. The tunnel in 900 feet will be continued. The Town Talk is owned by William Shackleton, and is between the Empire and Badger Hill mines, near the Gold Blossom.

At the New Eureka mine of Canada Hill, near Nevada City, the 300-foot drain tunnel is being cleaned out and reopened. The tunnel cuts the shaft at depth of 75 feet and as soon as it is opened to carry off the surface water sinking the shaft will be resumed.

J. M. Meighan of Groveland, of the

Shady Creek mine, near Nevada City, says the centrifugal dredging pump is in operation. The pump has a 10-inch suction and an 8-inch delivery, with a 65 H. P. pressure, and handles 1500 yards of gravel daily. Ten men are at work on the mine.

At the Federal Loan mine in Willow valley, near Nevada City, Superintendent H. Ogden has fourteen men at work and high-grade ore is being taken from the seventh level. The 10-stamp mill is running steadily.

At the Orleans-Potosi mine on Gold Flat, near Nevada City, the hoisting and pumping plant is in operation and shaft No. 2 is under way. W. B. Gillingham is superintendent. The main shaft is being sunk and the drain tunnel is being opened. Ore is coming from No. 1 level and is being crushed at the Gold Tunnel mill.

Machinery for the mill of the New York-Grass Valley mine, near Grass Valley, is on the ground. The foundations have been laid.

The Yuba River Gold Placer Co.'s mine, near Grass Valley, has been closed for the winter, says the Minor.

Placer County.

It is expected the Marguerite mine, near Auburn, will resume operations, says President Gimble of the company. They will sink further in the original shaft.

Work has been stopped at the Crandall mine, between Auburn and Ophir.

Plumas County.

At the Claybank mine at La Porte the gravel channel is reported struck in a raise from the main tunnel.

San Bernardino County.

The consolidation of the Bagdad and Chase mines, near Ludlow, has been completed by incorporation of the Bagdad-Chase G. M. Co. in New York, with C. Depew of New York City, J. N. Beckloy, B. E. Chase and J. H. Stedman of Rochester, N. Y., and E. Van Etten of Boston, Mass., as directors.

San Diego County.

The Elevada mine at Banner was closed down last week, and Superintendent F. D. Jones says operations will resume Jan. 1st, when further development will be done.

Santa Barbara County.

The Santa Maria Oil & Gas Co., near Santa Maria, is down to depth of 2000 feet and reports good indications of oil. The well is a mile from the first hole sunk, says Superintendent Squier.

The Pinal Oil Co., near Santa Maria, has contracted for the delivery to the Standard Oil Co. of 120,000 barrels of oil, delivery to begin as soon as the Standard's tank at Port Harford is completed. Wells No. 1 and 4 are completed and producing. No. 1, while being tested, flowed 250 barrels in two hours. The derrick for No. 5 is completed.

Santa Clara County.

The Teresa Quicksilver M. Co. has completed purchase of its property near Edenvale, south of San Jose. The company has taken deed for 325 acres of land. The mine has been worked under a bond of $25,000 for two years. The price paid is reported at $100,000. The Santa Teresa proposes to inerease work.

Siskiyou County.

The Marsena Mott mining claim above Oak Bar, on the Klamath river, comprising eighty acres of the river channel, has been sold to H. J. Barton for San Francisco men, says Superintendent Mott. Work has begun.

Solano County.

A vein of coal 2 feet thick is reported struck on the Patrick Garrel land, near Vacaville, at a distance of 25 feet from the surface.

Shasta County.

The ledge in the Copper Queen mine, in Pitt River district, near Bear mountain, northeast of Redding, has been opened up, showing 50 feet wide. B. F. Rodgers, who has a bond on the mine for Eastern men, says 375 feet of tunnel have been driven.

Work on the Shasta May Blossom mine near De Lamar has been resumed after a temporary shut-down.

At Deadwood the Lappin mine has closed down. —— At the Three Brothers mine, Zont, Thorne & Carter are getting out ore and are running their arrastra steadily. They have uncovered another ledge showing 2 feet wide.——The Nicholson mine, near the county line, is shipping ore to the smelter.

Trinity County.

Location notices were filed with the County Recorder last week for a total of five lode claims and eight placer claims.

The Drinkwater M. Co. is operating its claims near Hayfork. The dam built in Kingshury gulch last summer stood the test of the recent high water. They have put up a sawmill, run by a gasoline engine, to be used in sawing their flume blocks and timber.

Tuolumne County.

At the Nonpareil mine, near Groveland, grading for the 200-ton mill is completed and the building is going up. In the mine the station at the 250-foot level has been completed, and contract let for crosscut and drifts east and west on the vein.

F. Vassalo has bought the Bon Ton quartz mine, ½ of a mile below Pine Log crossing, on the Stanislaus river, near Columbia.

At the Horseshoe Bend mine on the Stanislaus river, near Columbia, twenty men are at work, and it is expected the number will be increased. The tunnel is in 500 feet, and crosscuts are said to show the vein 105 feet wide. When 600 feet additional are driven the tunnel will be under the shoot cut in the surface shaft. The company proposes to build a 100-stamp mill, with a chlorination or cyanide plant, all to be driven by electricity. An assay office and superintendent's quarters have been built. C. G. Grimm is superintendent and E. Goss manager.

F. Boitano has bought the Dora C. quartz claim, an extension of the Melba, near Sonora, says the Banner; also the Eagle Bluff millsite, No. 1.

Superintendent N. Carmichael of the Confidence mine at Confidence, says the mill will be kept running until Jan. 1, provided the ore holds out, then the Confidence mine will be shut down and operations suspended indefinitely.

Yuba County.

W. H. Hill, H. Gillen, W. E. Nims and A. M. Meintz of St. Louis, Mo., have closed a deal whereby they will operate the New Blue Point gravel mines, near Smartsville. In connection with working the mine they will rebuild the ditch and flumes that carry water to be sold for irrigation purposes. C. H. Hill is superintendent.

COLORADO.

(Special Correspondence). — Sympathy seems to be the main object for striking in different parts of Colorado. In the northern coal fields everything was granted the strikers, and now they refuse to return to work out of sympathy for their fellow workmen in the southern field, who have been unable to get any concessions from the operators. It will undoubtedly be the means of bringing in outside labor to operate the coal mines, the same as the metal mines of Cripple Creek district.

Telluride district has the militia, and the operators will undertake to start the mines. However, with the militia on the ground, it will make some difference with the strikers.

At Cripple Creek a large percentage of the mines are operating, and it is claimed by the operators that they can secure plenty of men. The El Paso, on Beacon Hill, is outputting as large a tonnage as before the strike and employing the same number of men. About 40% of the old men are at work on the El Paso. The Elkton is running the same as before the strike, likewise the Gold Coin and Strong. The Independence has between 450 and 475 men at work. While this mine is not up to the standard, yet it is believed within the next month they will be producing the same number of tons as before.

Following the blowing up of the 600 station of the Vindicator mine, several of the operators of other mines have received notices to leave the district under penalty of death. None of them have left, and do not expect to leave, as they intend to stay and run their mines. It is conceded by the miners that the Western Federation made a mistake, and that they are defeated, as far as the Cripple Creek district is concerned.

Denver, Nov. 29.

(Special Correspondence). — Gov. Peabody has given out the statement that intimidation and lawlessness must cease, and that anyone wishing to work shall receive military protection. The strikers in the Cripple Creek district have lost. The mines are in full operation with non-union men. Telluride is protected by the militia and the mines will again be in operation this month.

The coal strike has caused considerable hardship, but this seems to be at an end. In the northern Colorado fields the strikers have voted to return to work, the operators having granted them everything asked for. In the southern fields the operators will not grant any concessions, but have commenced operations with non-union men.

Violence has been resorted to at the Globe plant of the American S. & R. Co. at Denver.

Denver, Nov. 30.

Boulder County.

The coal miners of Louisville, Lafayette and Superior, and other northern Colorado camps, returned to work on the 30th ult., all of their demands having been conceded by the operators. There were 2000 men put to work, and it is expected this week the full number will again be working, and producing 4000 tons of coal daily. It is thought the settlement of the strike in the northern fields will have some influence in settling the strike in the southern fields.

At the Gold Lodo mine, near Wall Street, men have been put on and the output is being increased. Operations have resumed on the 200-foot level, where there is said to be a body of high-grade silver ore.

The Apex M. & M. Co. will resume work on El Dorado mountain, near Eldora.

Clear Creek County.

(Special Correspondence).—The Consolidated Gem. M. Co., W. E. Renshaw manager, is remodelling the State Oro Sampling Co.'s plant and is putting in stamps.

Idaho Springs, Nov. 29.

The Santiago mine, near Georgetown, has been consolidated with the Hazeltou Con. M. & T. Co., with W. Rogers as manager, who is also manager of the Baltimore tunnel. The Santiago group consists of eleven claims and the Santiago mill site. The property is developed almost entirely by tunnel system, driven on the ore body.

W. P. Clough of Empire, treasurer and manager of the Continental Electric Power & Irrigation Co., says the company proposes building a mill at Empire. This mill will have capacity of 100 tons daily and will have a cyanide annex. It will do custom work exclusively. A number of the mine operators in Empire district are shipping their mill dirt to Idaho Springs for treatment. A pipe line excavation 6000 feet in length has been cut by the company, and work is progressing on the dam which will protect the water supply. The company will furnish power for the mines through Empire district and in Fall River district, as far as Yankee Hill, and will be able to generate a maximum of 3000 H. P.

Manager Boughton says he is arranging to increase work on the Bi-Metallic tunnel and group of claims controlled by the Boughton T. & M. Co., near Silver Plume. The Blue Bell has produced ore of high grade and the Countess lode has yielded ore carrying a value of 100 ounces silver and 20% lead. The Three Nations, another lode, will be cut by the tunnel. The Bi-Metallic tunnel penetrates McClellan mountain.

The Eagle mine at Dumont, being operated by Micheals & Anderson, will resume production. They have men at work unwatering the shaft and clearing the workings. A cable 1 mile in length is being put up, which will carry the ore from the shaft to the Spect mill, which has been bought. The shaft is down 350 feet.

Manager B. F. Kelley of the Kelley tunnel has an option on the Junction, Fred Rogers, Clift, Big and Little Emma Junction and other claims on Democrat mountain, near Georgetown, and proposes to drive the Hansboro tunnel, at the base of the mountain, near the railroad tracks, to cut these claims at 1000 feet below their lowest workings. The work of enlarging and retimbering the tunnel is now under way. When completed wires will be strung from the plant of the United Light & Power Co. to furnish electric power at the terminal.

The Memphis & Idaho Springs G. M. Co. is arranging for a compressor plant, to be used in extending the Tropic tunnel, near Idaho Springs. The company's claims include all the ground between the Gem and Sun & Moon mines.

C. S. Desch of Silver Plume is making regular shipments of ore from the Diamond tunnel, near Silver Plume. He says it is intention of the company to build a mill at the tunnel mouth next spring.

The Shafter mine, near Idaho Springs, will have a mill, says Manager A. H. Roller. The Shafter will be cut by the Central tunnel, and after connection has been made the property is expected to output 100 tons a day.

Custer County.

The Preston G. M. Co., near Rosita, has resumed operations, and is sinking its Bismuth shaft. There is a showing of lead carbonates.

The Humholdt and Pocahontas mines, at Rosita, have been sold to F. Fruend et al., of New York. Operations will begin this month and additional machinery will be put in. The plant at the Humboldt will be overhauled and refitted. These properties were formerly producers of silver ore.

Dolores County.

H. C. Demming, State Geologist of Pennsylvania, reports tin ore found in the shaft of a mine near Rico, which was being worked for gold and silver. Samples are said to have assayed 14% tin. P. S. Rider of Durango is manager of the mine. The ore has been uncovered 18 feet thick.

Gilpin County.

The Jupiter G. M. & M. Co. has been incorporated by J. W. Smith, G. M. Edmonson, et al., of Colorado Springs, to take over and develop a group of mines and mining claims at Central City (Saguache county), Crestone and Bowermau (Gunnison county). The holdings of the Jupiter Co. consist of three claims at Central City, making fifteen acres; five claims at Bowerman, comprising fifty acres, and four claims at Crestone, comprising forty acres.

N. J. Pike & Co., of Idaho Springs, leasing the Wautauga mine near Russell Gulch, have unwatered the mine and will increase development.

Grand County.

C. Wolcott, T. S. Waltenmeyer et al., of Boulder, report locating copper prospects on Arapahoe mountain, in Grand county. The vein is 30 feet wide, and carries 10 feet of copper ore. Should the proposed State wagon road be built by way of Arapahoe pass it will run near these claims. They will begin development in the spring.

Gunnison County.

The Whig mine, near Pitkin, will resume operations this month, says the Pitkin Miner.——Operations will begin this week on the South Hall's Gulch tunnel, which is to cut the Silent Friend ore shoots at depth. The contractors are driving the north tunnel.——The Colorado S. & M. Co. has men at work in the West Mountain tunuel, near Pitkin, preparatory to resuming operations.

After being closed for ten years, owing to low price of silver, the Jimmy Mack mine, near Tin Cup, a former producer, will be again started up this month, say C. J. Carpenter and H. J. Waldron of New Brunswick, N. J. There is a mill on the property, and in the ore bins are several hundred tons of ore, taken out before the mine shut down. There are tunnels, drifts, raises and stopes aggregating 5000 feet of workings. The company will overhaul the mill and add more machinery. A. Lajune of Gunnison is superintendent.

The Tomichi Dome G. M. & M. Co. has been organized to operate at Bowerman, with J. G. Crooks of Denver as manager. It owns eleven claims east of Tomichi dome, which are to be developed by a tunnel.

Hinsdale County.

T. L. Beam and E. W. Wiley have a bond and lease on the Æolus group in Cascade gulch, near Lake City, and have begun work.

Ten stamps are dropping at the Hanna M. Co.'s mill, near Lake City, and the others will resume this week.

Las Animas County.

The coal strike situation at Trinidad shows little change. The injunction case of the United Mine Workers against the Victor Fuel Co. to restrain the latter from interfering with union men visiting any properties of the company, was decided against the unions, as Judge Lindsay dismissed the proceedings on the ground of lack of evidence. It is thought the settlement of the strike in northern Colorado may influence the situation in the southern fields.

Onray County.

The Yale-Brown M. Co. of Red mountain is preparing for the winter by putting up several buildings. Work on two tunnels is progressing.

San Juan County.

Tungsten ore is reported in the Adams claim on Bonita mountain, near Silverton, and in the claims, Dawn of Day, Sunshine, up Dry gulch, and in several claims in Minnesota gulch. The veins run from 3 to 4 feet wide, but the development is yet superficial, consisting of short tunnels and open cuts. The quartz carries hubnerite in small streaks and bunches, and it is thought it can be made to pay by concentration.

The Northern Light M. Co. is developing a group of ten claims on west slope of Bouldor mountain, near Silverton, under management of W. N. Sesson.

A group of Picayune gulch claims, near Silverton, viz., the Golden Eagle. Neglected, Crown Diamond, Scotia Extension, Scotia Extension No. 2 and Atlantic, have been sold to A. A. Brown for $20,000, of which $15,000 has been paid.

Carpenters and machinists are at work on the tailing plant of the Gold King mill, near Silverton. The building will occupy ground space of 73x167 feet, and will contain thirty-six slimes tables, with direct current motors to propel same.

Work will be resumed on the Charter Oak mine tunnel, near Howardsville, owned by T. Trippe and O. Kimball. The 200-foot bore will be continued 250 feet to cut the Charter Oak vein at a vertical depth of 300 feet.

The Mayflower lode and one-third interest in the Slide lode have been sold to Malchus Bros. of Silverton. The Mayflower and Slide are said to be continuations of the North Star vein after it reaches the gold belt of Little Giant mountain.

San Miguel County.

Justice of the Peace Robinson at Telluride has issued a lot of John Doe warrants to Sheriff Rutan to be used as he soes fit, in connectiou with tho striking miners. Thirty-eight men were taken into custody. soldiers accompauying the deputy sheriffs and assisting in making the arrests. Twenty of the prisoners were discharged hy Justice Robinson. Sixteon othors were fined $15 each for vagraucy and two were assessed $35 each ou tbe same charge. One man was fined $5 for contempt of court. The sentences, except in the contempt case, were suspended until 2 P. M., December 2, when they must be paid or iucarceration will follow, unless the men are at work. With 500 soldiers posted at tbe various mines in Telluride district, the success or failure of the attempt at resumption of miniug depends on the ability of the mine managers to find meu who will work in the places of tbe strikers. A majority of the 1200 miners and millmon who went on strike to enforce the demand for an eight-hour day iu the mills, have left for other mining districts. There romain only ahout 300 idle miners and millmen.

Summit County.

T. R. Griffitb has a lease and bond on the Jossie gold mines, 4 miles from Breckenridge, in Gold Run. The property consists of thirty lode claims, a 40-stamp mill and other surface improvemonts. Superiutendent A. Matthiossen will resume development work this week. The mill will not he started up before May 1, and in tbe meantime ore will be hlockod out. In the spring machine drills will be put in.

Teller County.

Three moro companies of the Colorado National Guard, from Lamar, Rocky Ford and Pueblo, were sent to Camp Goldfield last week, and the gaurds at points in the district are being strengthened, particular attention heing given to tbe outposts. It is roported tbe soldiers located and have arrested the owner of the revolver found in tho sixtb level of the Vindicator mine. A numher of other arrests have been made in connection witb the Vindicator explosion.

The Henry Adney shaft, near Cripple Creek, on which M. J. Burke resumed operations last week, will be sunk to 500 feet depth. At that point laterals will be startcd. The Henry Adney adjoins the Buckeye, of the Old Gold Co.

There are ninety-five men working on tbe Vindicator mine at Independence in two sbifts. Tbis is about equal to the former number of men employed, but does not include lessees, which brings the number up to 130. Tbere are being mined and shipped daily forty tons of ore, whicb averages three ounces gold per ton. The ore is being mined in a stope 400 feet north of the shaft at the 800-foot level.——Lessee Smith, operating tbe Ida May claim, is driving a crosscut at depth of 400 feet expecting to cut the Joe Dandy ore shoot. ——The Gold Ore Leasing Co., operating under lease tho Saturday claim on soutbwest slope of Beacon hill, noar Cripple Creok, is sinking the shaft and expects to continue to the 200-foot point before doing lateral work.

The suit of the Stratton Independence Co., Ltd., of London against the Strong G. M. Co. has been dismissed, the litigants having effected an agreement out of court. The Stratton Co. accepted $18,500 in lieu of $1,750,000, for which it sued as full payment for all damages for the extractiou of ore from its territory in Cripple Creek by the Strong Co. A boundary line between the properties has also been agreed upon.

The water flow from the Cripple Creek drainage tunnol was doubled in volume last week by cutting two additional channels in the east heading. The flow amounts to 3000 gallons per minute. Measurements taken sbow the water had receded a total of 11 feet since Sept. 6, the day that tho tunnel was connocted with the El Paso Co.'s shaft, and the fall of 11 feet in the water area of tbe district means that a total of 650,000,000 gallons of water has flowed through the tunnel since the connection was made, says tbe Gazette. As the figures secured during the pumping season showed that it cost practically $10,000 per vertical foot to pump the water, it is seen that the tunnel has already paid for itself, as the tunnel proper cost between $80,000 and $100,000. The breast of the tunnel is nearing the point where the main water course should bo tapped. Tbe breast of the tunnel is up iu the loose phonolite. The effect of tbe tunnel is already felt throughout tbe district, and bas proven that the entire district, with the exception of the east side, is connected by underground water courses, and that the currents flow in every mine in the district. (By the east side is meant the Isabella, Vindicator and Golden Cycle properties.) In the Gold Coin mine, on Battle mountain, the company has a water gauge, and that indicator is showing a decrease of pressure. ——The work of extending tbe east lateral from the El Paso Co.'s main shaft is progressiug. The flow is increasing daily.

Statements made by the railroad officials indicate tho tonnage of ore for the month of November will he 90% of the normal output. A numbor of the properties which prior to the strike worked a gravoyard shift, have dispensed with it and are ouly workiug two shifts. Somo of the properties have only one shift where formerly two, at least, were employed.

IDAHO.

Blaine County.

The new railroad ratos on zinc and other low-grade ores from Wood River district to the smelters has led to the resumption of operations at the Star group of mines in Star gulch, 2 miles southwest of Hailey, says the Wood Rivor Times. Superintendent A. Richardson bas men at work making an air connection from tbe 465-foot level to the shaft, which is down 365 feet. When this connection is made the number of men will be increased to twenty-five. Thore are over 20,000 tons of zinc on the dumps and a concentrating mill on the ground.

Boise County.

H. L. Woodburn has bought the East Hill placer ground, near Idaho City, with water rigbts, ditches and other equipment, from tbe War Eagle Co. The price is reported at $40,000. The water of More creek can be conveyed to Gold Hill, which has a deposit of gravel, averaging 100 feet in deptb and extending ¾ of a milo north along the east side of Elk creek, and east the same distance, says the Idaho World.

Custer County.

The Carbonate Hill M. Co., operating near Galena at Stanley basin, proposes to build an elootric road from Ketchum to Stanley basin, a distance of 60 miles. This will be to haul tbeir ore and supplies to and from the railroad to their mines, and, secondly, for general freight business to offset tbe cost of such hauling.

Idaho County.

G. E. Sanders, president of tbe Angel Con. M. Co. of New York, says the Angel Co. owns a group of twenty-four claims in Warren district, also several claims in Yellow Pine Basin in Thunder Mountain district. Among the properties owned by the company at Warreu are the Goodenough and Rescue, on which considerable work has hoen done. On the Rescue there is a 10-stamp mill. Sanders has arranged to increase operations next spring. The company will make Weiser its headquarters and base of supplies.

Lemhi County.

E. Minert reports tbe discovery of tin ore at Prairie Basin. The ore runs from 1½% to 2% in the metal and contains a little wolframite.

Shoshone County.

The Horst-Powell C. M. Co. has been incorporated by E. L. Powell, M. F. Mendenhall of Spokane, Wash., with E. E. Horst of Kingston. The company owns a group of copper claims on the Little North Fork of the Cœur d'Alene river.

Tbe American Lead-Silver Supply Co. has been incorporated by J. L. Brice, J. A. Bennington, T. B. Dennis, L. Frankell of Burke, L. Feldman of Murray and J. H. Wourms of Wallace.

The Iron King M. Co. has been incorporated, owning a group of claims in Evolution mining district. F. Eppinger, J. Gann, W. J. Bracking and J. L. Columhus of Wallace, with H. N. Freeman of Oshurn are incorporators.

KANSAS.

Cherokee County.

The Marsball mine, on the Galena Lead & Zinc Co.'s ground near Galena, is again working. The present operators are C. N. Crissman of Webb City, M. H. Cavanaugh and T. J. McKnight. Tbey have laid tracks in the upper level and will work two faces of ore. They are unwatering and expect to reacb good ore at the 100-foot level, where the former operators were working when they pulled the pumps.

The Galena Lead & Zinc Co. has unwatered its ground at Galena. Two 10-inch pumps have boen working steadily at the main sbaft. A new shaft has been sunk north of the Cousins shaft to depth of 150 feet. A face of lead and jack has been found from 125 to 150 feet under the old workings and this will be mined. Leases will be made. The company has had a drill in operation. Several new shafts will be sunk after the new ore body.

Neosho County.

The official report on the general Kansas field sbows that on October 1 there were 1014 wells producing, and on October 25, 1158, with 184 wells completed during the month and forty ahandoned.

The Colorado-Kansas Oil & Gas Co., of Colorado Springs, Colo., owning 400 acres of oil lands 7 miles south of Chanute, will sink two more wells on its ground and put up a pumping plant, says C. M. Smith, president. Tho company has one well ostimated to flow fifty barrels a day, tho grade of the product being 34° speoific gravity.

Chanute reports say that New York men will build a 2000barrol independont refinery.

MICHIGAN.

Houghton County.

Repairs at Tamarack No. 5 shaft of the Calumet & Hecla C. Co., near Calumet, have been completed and rock is again being hoisted.

The electrification of the underground tram lines in the Quincy is completed and the system is expected to be in operation this week.

The present production of tbe Franklin mine at Hancock is coming mainly from the Junior mine, which with a single shaft is turning out more rock than was considered possible two years ago, says the News. With the completion of the additional sbaft on the conglomerate lode, the Franklin will be able to operate its 3-stamp mill to full capacity.

The Isle Royale mill, near Hougbton, is operating two heads of stamps and crushing 900 tons of rock daily. The output of refinod copper is showing little change, however, and for month of November amounted to about 160 tons.

Keweenaw County.

Diamond drill work on the south end of the Isle Royale property having been discontinued for the wintor the drill is in operation on the Cliff mino, north of Calumet. In the spring it will be taken back to tbe Isle Royale and the work of locating the Baltic lode resumed.

Menominee County.

A copper deposit has been discovered near Carney, 30 miles north of Menominee, which is said to be similar to the Calumet deposits.

Ontouagon County.

The rock from the Michigan mine, at Rockland, being handled in the Mass mill, is said to bo proving softer than Mass rock, and it has heen shown the single-head can handle 600 tons of rock daily. One run milled 330 tons in 12 hours and 15 minutes. The walls of the Michigan smelter are completed and the structural steel for the roof is arriving on the ground.

MISSOURI.

Barton County.

The drill on the lease of the Golden City Oil & Gas Co., near Golden City, is down 200 feet and they expect to get oil in quantity at less than 1000 feet. At 70 feet the drill, after going tbrough a stratum of bituminous sandstone, went into 7 feet of what is said to be liquid asphalt.

Jasper County.

The Portland M. Co., owning the lease on sixty acres of land a half mile north of Webb City, has tbe shaft 8x16 feet in tbe clear, down 230 feet. It is equipped with cage ways and two cages supplied with safety clutches. The mill has capacity of 300 tons per day. Power is supplied hy an engine of 130 H. P. There are four boilers, 60, 100, 150 and 200 H. P., respectively; and two air compressors which run eight drills. The ore is worked at the 209-foot level, and two pumps, each having a 6-inch discharge capablo of raising 600 gallons per minute, have been placed at the shaft bottom. One of these pumps will handle the water, the other being used in emergency. Two mules are worked under the ground. They are, however, taken down and brought up every day. The company has an electric lighting plant. From the prospect work done, additional shafts will be sunk. M. C. Conkey is president and manager of the company.

The Binghampton mill, macbinery and the fee in twenty acres east of Joplin, were sold at assignee's sale last week, to A. E. Humphrey for $2500.

J. W. Brooks, E. L. Davidson and E. R. Shipley have organized as tbe Brooks M. Co., in Joplin.——J. Luke, J. Brown and B. Ash have organized as the Luke & Brown No. 8 M. Co., at Carthage.

Forristall & O'Donald expect to start up the Florence F. mine, near Joplin, which has shown prospect in a drill hole, and a shaft will be sunk.

Lawrence County.

At Stotts City, at Lucky Jack No. 2 mine on Shipman land work on tbe mill is progressing, and it will be ready for operation this montb.——The drill hole on tbe Bud Smith land is showing up ore.

MONTANA.

The State Legislature met in special session Dec. 1 to consider the "fair trial bill," which will give tbe Supreme Court authority to review facts in cases of equity and change of judgeship. This bill is the outcome of the copper troubles in Montana which resulted in the closing of all the Amalgamated C. Co. mines.

Beaverhead County.

It is reported that the Watseca mine at Rochester will he reopened. The shaft is being unwatored. The mill will start up next week.

Fergus County.

Tho Case-Wilson Cyanide Developmont Co, is increasing developmont work on the Gilt Edgo Charley group, near Gilt Edge, says E. H. Crabtree. The shaft on the Gilt Edge Charley is down 110 feet and they are placing a steam hoist. On the Evergreen claim of the same group the Case-Wilson Co. have opened a body of ore averaging $3 per ton. The Gilt Edge Charley group is south and west of the Gilt Edge mines.

Granite County.

A lease and bond have been taken on the iron mines on Franklin hill near Philipshurg, by S. H. Babcock and D. T. Conkling, and they intend shipping two carloads or more of ore daily to Butte smelters. There is a 5 foot ledge wbich averages 50% iron, and the smelters desire it for fluxing purposes, says the Progress.

Jefferson County.

The Eva May mine in Cataract district, near Basin, has ceased operations for the winter.

The Pittsburg C. M. Co. of Butte has bougbt the iron claims of Jaquemin & Rotbfus, near Elkhorn, and will put the property in operation this month. The ore is an iron sulphide and will be used for fluxing by the company in its smelter near Butte.

Lewis and Clarke County.

The Sacajewea G. & C. M. Co. has been incorporated to operate near Helena by H. Altman of New York, W. J. Anson and A. S. Hovey of Helena, D. B. Sickles and W. T. Lawson of New York. Forty-seven mining claims have been acquired, with an area of 800 acres; also all the available water, 500 miners' inches. Electrio power will be obtained from the Missouri river dam. Considorable development work has already been done, and the ore carries copper and gold values. Work will be resumed this month.

Madison County.

The Monitor & Revenue M. Co., operating the Revenue mine near Norris, will build a 100-ton cyanide plant.

Tbe Kennet M. Co. has reincorporated as tbe Alder M. Co. Some additional property in Alder gulch recently bought has been transferred to the new company, as well as the Kearsarge mine near Virginia City.

The Greon Cambell M. Co. of Butte and Eastern men, who havo a loase and hond on the Green Cambell mine near Silver Star, bas lot a contract to sink a 200-foot shaft to E. W. Merritt. The ore is gold-bearing quartz.

A strike made in the U. S. Grant mine, near Virginia City, in the lowor tunnel at 250 feet from the mouth, sbows values in gold. The mill started up last week with five stamps. It is expected fifteen stamps will be dropping this week. The mill is built for treatment by amalgamation, concentration and cyanide processes. L. D. McCall of Chicago, Ill., is manager.

The Cook G. M. & M. Co. has been incorporated by E. Stevens and F. A. Brown of St. Paul, Minn., and M. A. Goodner of Pierre, S. D., with principal offices at Pierre, S. D. The company is organized to operate the Fortune group of mines on Williams gulch, 5 miles west of Virginia City. A concentrator will be built.

R. C. Knox, manager of tbe Monitor & Revenuo M. Co., operating near Revenue, says tbey will build a 100-ton cyanide plant, work to begin in the spring.

Silver Bow County.

The Goldsmith mine, half a wile west of Walkerville, a former producer of gold and silver, is being operated by C. W. Ellingwood, who has a lease. Ore is being shipped. The workings are down 250 feet.

The Little Eveline mining claim has been leased for eighteen months to W. McGuire of Butte.

The Pypocka M. Co., organized last year by F. A. Heinze et al., at Butte, has taken over the Minnie Healy mine, recently awarded to Heinze by Judge Clancy.

NEVADA.

Esmeralda County.

The Montana Tonopah M. Co. at Tonopah reports shipping a carload of ore on Nov. 22 to the Western Ore Purchasing Co. at Reno, wbich after all shipment and treatment charges were deducted netted $22,226.47.

Lincoln County.

Superintendent Spare at tbe Ione mine, near Searchlight, has suspended operations temporarily while the mine is being equipped with a gasoline hoist and other improvements to increase development.

At Searchlight the Quartette M. Co. is working seventy-five men, the Southern Nevada M. Co. thirty-three men, and forty-five or fifty union men are doing

assessment work on claims for themselves and local parties. The non-union men who are working are kept close to the companies' grounds, the companies having provided their own commissaries for supplying their men.

Development work is in progress on the Hidden Treasure, Bay View and Tiger mines, owned by C. E. Mand, between the Cyrus Noble and Olympia groups, near Searchlight. The lead oponed measures 6 feet.

Storey County.

It is reported C. Butters proposes to double the capacity of his Six-mile canyon cyanide plant, near Virginia City, says the Enterprise.

NEW MEXICO.

Grant County.

The International G. M. & M. Co. at Malone, 20 miles north of Lordsburg, is sinking the main shaft on the Summit mine, which is down 140 feet and shows an ore body from the surface. The ore averages 5 feet in width, with an average value of $15 per ton in gold and silver, says W. H. Stevens, manager. He is arranging to build a 50-ton cyanide plant, which is expected to be in operation by spring. The plant will be 1 mile below the mill, in a canyon, where there is an abundance of flowing water. The company has a lease on this water right for twenty years. A wagon road has been built from the mines to the millsite.

At Stein's Pass the concentrator on the Beck mine is completed and is expected to be in operation this week. The Beck mine is a silver proposition, carrying gold. It is the intention of the management to add a cyanide plant.

The Michigan-New Mexico C. Co. reports development progressing on the Dacotah Pearl mine, one of the company's group of five claims near Shakespeare, south of Lordsburg. The shaft is down 200 feet and has ore all the way, but of low grade. The ore is 8 feet in width and consists of quartz carrying carbonate and sulphides of copper, red and black oxide of copper, $2 gold and 5% copper per ton.

Sierra County.

A gold strike is reported made at Apache canyon, in the Cobolla mountains, east of Hillsboro. A large number of men have gone from Hillsboro to that section.

Taos County.

The Tusas Park M. Co. proposes to build a concentrating plant at Tres Piedras, in Bromide district, say J. W. Murray and F. White of Manistee, Mich., directors in the company.

OREGON.

Baker County.

The Hoad two-thirds interest in the Rainbow group, near Sumpter, has been bought by the Commercial M. Co. of Portland, which owns the California and the Radcliffe groups. W. E. King is manager. The owners of the Rainbow have been hauling their ore to the Golden Gate mill, 2 miles distant, on South Dixie creek, and report that for the past three months they have had returns of $50 per ton. These mines are 1 mile east from the Morning Star group, in Mormon Basin district.

The Alpine G. M. Co., near Sumpter, building a 20-stamp mill, has discontinued construction work for the winter on account of snow. In the meantime development work at the Alpine mine will be continued, says Superintendent Addoms.

Manager F. E. Pearce of the Iron Dyke copper mine at Homestead, on Snake river, 60 miles east of Baker City, says the Iron Dyke mine is in full operation, blocking out ore, and neighboring mines are working double shifts.——At Homestead the Ladd Motals Co. is making progress with building its 100-ton smelter. In another year they expect to have railroad transportation.

The Golconda mine, near Sumptor, last month shipped over 150 tons of concentrates to the smelter, and shipments this month promise to be large.

The North Polo and Columbia and the E. & E. and Taber Fraction are also shipping ore. The first two send concentrates; the latter two are shipping rock from the new workings. The cleanup from the Columbia, taken to Baker City last week, is estimated at $40,000.

The Alamo mill is completed and ready to start up. The flume is almost completed and when connected mill operations will commence. It is expected that within two weeks the stamps will be dropping. There are over 3000 feet of underground work done in the Alamo and large bodies of ore are blocked out for milling.

The Golden Wizard Co., near Sumpter, has contracted for material for construction of the new mill, which will be built as soon as the material can be placed on the ground. The main shaft is down 175 feet; sinking has been suspended. The shaft is now full of water.

Josephine County.

B. Hurst is developing his quicksilver ledge on South Umpqua, near Wolf Creek.

The Wolf Creek M. & Dev. Co., at Wolf Creek, is running full blast and operating two giants, says R. C. Shipley, superintendent.

The Ramsey & Ingram copper claims, on Slate creek, near Grant's Pass, have been bonded by S. Bowden for $25,000. Bowden will put men to work and develop the claims during the winter. The ledge carries values in copper and gold. The vein shows a width of 100 feet on the surface. The claims are within 2 miles of the surveyed route of the proposed railroad from Grant's Pass to the coast.

A. B. Cousin, manager of the Galice Con. M. Co. of Portland, says their hydraulic properties on Galice creek are expected to be ready to begin piping this month. There is now an abundance of water in Galice, and the supply will not diminish till late next summer. The dams and reservoirs built during the summer at the head of the Galice Con. ditches on both forks of the creek are conserving the water.

Jackson County.

The Sborty-Hopo M. & M. Co., near Ashland, is increasing development work. The miners last week cut an ore shoot on the 335-foot tunnel drift carrying values in gold.

Union County.

A discovery of molybdenum is reported in eastern Union county, 12 miles southwest from Cornucopia camp. The owners are arranging to make trial shipments.

SOUTH DAKOTA.

Lawrence County.

The Eliptic M. Co., which bought the holdings of the Arcade M. Co., has bought additional ground and now owns 1000 acres near Maitland. The ground adjoins that of the Penobscot on the north and east. J. G. Leming, manager, says a hoist will be put in and development begun.

The Ivanhoe mine, near Deadwood, is putting in machinery, including a hoist, pump, pipe and fittings, etc., and a boiler and compressor.

F. E. Wade, manager of the Globe G. M. Co., is putting in a cage, additional cars, etc., to be used in drifting and crosscutting on the 500-foot level of the company's mine west of Lead City.

Golden is the name of the new town in Nigger Hill district which has sprung up about the Golden Empire M. Co.'s property. The town is near the head of Potato gulch, near the Ontario claim. The Ontario shows a big vein in slate, which the company will open up. A hoist is to be put in and the shaft continued to 500 feet.

Another discovery was recently made on Mineral hill on the Gold Coin claim, where ore was found showing gold. C. Rock is superintendent.

A strike is reported in the Lucky Strike mine on Box Elder creek, 12 miles south of Deadwood. The pay shoot is said to extend from wall to wall of the vein, 11 feet. This find was made in drifting from the shaft at the 100-foot level.

A gold bar worth $5200, representing three weeks' run of the 50-ton cyanide mill at the head of Two Bit gulch, 4 miles from Deadwood, is the first output of the mill since it was remodeled. The plant was started a little over a month ago, after being shut down and the capacity doubled, five stamps being added to the five first. A number of new slime vats were added to the mill equipment, as in the experiments carried on with the plant early last spring it was found that the capacity of the plant for handling slimes was inadequate. The ore being treated by the Golden Crest makes a high percentage of slimes when crushed under stamps, and the extraction of the gold values has been a matter of experiment.

UTAH.

The Deseret News says that many new mining enterprises which were to have opened up have been advised by the Utah Fuel Co. not to do so as it is at the present time a question with them whether they would be able to fill coal orders of any size. Inquiry at most of the offices brought out the fact that the greatest supply any of them had on hand would not last more than thirty days, and that most of them had not more than a fifteen days' supply on hand. It was stated that the United States M. Co. at Bingham was very short both at mine and smelter. The Beaver Con. has a supply on hand. The Majestic C. Co. at Milford has a good supply on hand, as also has the Cactus at Frisco. The coal situation will hardly affect the Park City mines as the supply from these is remote from the scene of disturbance. It is thought that if the shortage should keep up for thirty days, over half of the mines using coal in the State will have to close down.

Beaver County.

Now that the smelter of the Majestic C. Co. at Milford is in operation development work will be increased on its group of mines. It is intended to resume sinking on the shafts of the Old Hickory, O. K. and Harrington-Hickory mines, and to go below permanent water level. W. A. Farish is general manager of the company.

Carbon County.

President Kramer of the Utah Fuel Co. says they will not deal with the United Mine Workers. He says his company has at all times been willing to submit to the State Board of Arbitration any grievances that may exist between the employer and employe covering such questions as may properly come before the board. W. Price, the United Mine Workers' representative, says the strike would be declared off provided the Utah Fuel Co. would guarantee that no discriminations would be made against the employment of union men in the future. In reply to which President Kramer issued the following statement: "To work union and non-union men in the mines is impossible. Men who refused to join the union would be intimidated, and there would be too much danger of accidents. We are willing to take back in our employ all strikers who have not been agitators, and who have not destroyed property, provided they will give up their union cards."—— The five days notice of eviction served on the striking miners occupying houses on leased company ground expired on the 30th, and guards armed with rifles made a house-to-house call, demanding that the houses be vacated. The service of eviction notices has created an ugly feeling among the Italian strikers at Clear Creek and Scofield. Two companies of infantry are at Clear Creek.

Grand County.

New York men have a bond on the property of the Westwater Asphalt Co., at Westwater, says President Ray. The work of extracting asphalt will start this week. It is said they have contracts for a large amount of the product in the Southern States.

Iron County.

Manager McGrath of Detroit, Mich., of the Sulphides group of claims, near Stateline, says the company proposes building a 10-stamp mill. The Sulphides carries values in silver, with gold. Development consists of a 150-foot shaft and 500 feet of drifts and crosscuts.

Juab County.

At the La Reine mine, near Eureka, an engine and boilers have been put in.

The Eureka Reporter says the Uncle Sam mill, near Eureka, will be completed and in operation this week. The water line to the mill is finished and connections made with the Telluride Power Co.'s line for power.

W. Hatfield of Salt Lake City, manager of the Snowflake mine, gave orders last week to have the mine closed down, due to disagreement among the stockholders.

Piute County.

W. Armstrong of Milford, part owner of a gold property in Gold Mountain district, near Marysvale, says the Surprise G. M. Co. has been organized to develop the group.

Salt Lake County.

Manager Clays of the Peruvian mine at Alta says work was resumed this week.

The Conklin sampler, near Salt Lake City, has been put out of commission for an indefinite period, says the Tribune. The samplor has been in constant operation for thirty-five years.

J. J. Snider has a bond and lease on the Mystic Shrine group and Erie mine, adjoining properties near mouth of Markham gulch, near Bingham. They are to be developed this winter.

Summit County.

A gasoline hoist has been set up at the Silver Bell mine at Park City. It is at the upper end of the inclino tunnel which is being run from the tunnel level, 700 feet below surface.

Manager J. McConghy of the Diamond-Nimrod group at Park City, says the steam hoisting and development plant is in operation. The shaft, down 175 feet, will be sunk to 1000 feet, and it is expected 100 feet per month will be made, as no time will be lost in drifting or crosscutting. They will drive for the contact, which should be reached by August, 1904.

WASHINGTON.

Ferry County.

Five miles of the new wagon road to the Blue Horse mine on Iron mountain, near Republic, has been completed. It starts at the California mine road, a mile east of the San Poil sawmill, and follows O'Brien creek southward. This makes it possible for the Blue Horse mine to send ore to the smelters, and work will be resumed on it this month.

The tunnel on the Red, White and Blue group at Belcher Camp, near Republic, is in 325 feet, and cuts three veins, the first 22, the second 65 and the third 16 feet wide. It has also run past the hanging wall of the third vein 50 feet into the diorite. The claims in the group are the Copper Bottom, the White Stone, the Black Diamond and the Red, White and Blue, midway between the Belcher and the Hawkeye mines, and are owned by R. W. Hunner, G. W. Tripp, W. H. Bingham and R. Brownrigg. A station will be cut at the end of the tunnel and a shaft sunk 200 feet.

The Trade Dollar mine at Republic has closed down for the winter, owing to the steam hoist being inadequate for the work required. The management, being interested in the lease of the Nob Hill mine, will work that until spring, when a heavier heisting and pumping plant will be put in at the Trade Dollar.

Snohomish County.

The shaft at the Wayside mine, near Granite Falls, will be sunk to the 200-foot level. The drift at the 100-foot level is in 60 feet. Manager Habecker says the ore taken out of the tunnel and shaft in developing will pay two-thirds the operating expenses of the mine. No stoping will be done until the mine has been further developed.

Whatcom County.

C. H. Ballard, manager of the Mammoth mine in Slate Creek district, east of Whatcom, near Mt. Baker, says he is arranging to build a chlorination plant capable of handling five tons of concentrates daily, and machinery is being hauled in. The company will put in ten additional stamps in the spring The 10-stamp mill at the mine, during a run of forty days, turned out $18,000 in gold and silver, $11,000 of which was secured on the plates, the remainder being in concentrates. About 2000 feet of development work has been done, and work in the mine will be continued through the winter. The Eureka mine has plans for increase of development work, and the Chancellor will work all wiuter. Ballard says the main drawback to mining in Slate creek is the lack of roads. The natural outlet is on the west side of the mountains, but a road 65 miles long would be needed to reach the Great Northern railroad. Forty-five miles of the road between the mines and Goodell, in Whatcom county, passes through a rough country, but the remaining 20 miles would be comparatively easy to construct.

WYOMING.

Carbon County.

In the lower workings in the Doane-Rambler mine, near Grand Encampment, connection has been made with the old shaft by the drift from the lower tunnel, and the mine is drained. A station has been cut, machinery placed, the shaft enlarged to its present depth below the station, and sinking will be resumed. Superintendent Powell says he is sending out by teams copper ore taken from the shoot cut in the drift from the tunnel which will run 30% copper.

FOREIGN.

AFRICA.

Rhodesia.

The South African Gold Dredging Co., near Bulawayo, reports the electric power plant and dredgers Nos. 1 and 2 in successful operation.

Transvaal.

The Transvaal Chamber of Mines at Johannesburg reports the gold output for month of October of the mines which have so far restarted working as indicated and compared with corresponding months of 1902:

	1903			
	Witwaters-rand. Ozs.*	Outside Districts. Ozs.	Total. Ozs.	1902. Ozs.
January....	192,934	6,345	199,279	70,341
February..	187,977	8,536	196,513	81,405
March.....	208,456	9,009	217,465	104,127
April.....	218,900	8,971	227,871	119,589
May.....	224,409	9,716	234,125	128,602
June.....	228,167	10,153	238,320	142,780
July.....	242,070	9,573	251,643	140,179
August.....	262,569	9,349	271,918	162,750
September	267,513	8,684	276,197	170,802
October....	275,064	8,880	284,544	181,440
November..	.....	....	.....	187,575
December..	.....	....	.....	196,023
Total...	2,308,659	89,016	2,397,875	1,704,413

* Returns are in fine gold.

The Transvaal Chamber of Mines at Johannesburg, Nov. 10th, reports:

Natives distributed to mines during October	
by Native Labor Association	7,208
Time expired and other wastage	6,716
Net gain during October	492
Total number employed, end of October	68,958

An allotment of 588 natives was made to the railways, otherwise there would be a net gain for October of 1080.

AUSTRALIA.

New South Wales.

The exports of minerals from New South Wales during the nine months ending September 30th are reported as fol-

lows: Silver, 814,861 ounces, valued at £82,032; silver-lead, 246,201 tons, valued at £901,363; copper, 7715 tons, valued at £366,544; tin, 1431 tons, valued at £177,400; coal, 2,866,146 tons, valued at £1,336,561; total value of minerals exported £2,863,900, as compared with £2,659,261 during the corresponding period of 1902.

The gold yield of New South Wales in October amounted to 32,319 ounces, valued at £119,246. The gold yield for ten months was 269,373 ounces, valued at £985,707.

Queensland.

The Queensland gold returns for the month of October were:

District.	Tons crushed.	Yield in ounces.
Charters Towers	24,300	43,400
Croydon	6,900	8,200
Gympie	16,700	14,400
Mount Morgan	19,300	9,100
Ravenswood	1,900	3,700
Other fields	5,100	3,900
Alluvial	....	1,700
Total		84,400

The Mount Morgan G. M. Co. at Mount Morgan reports that during October 18,531 tons were chlorinated; gold returned, 8989 ounces.

The Mungana M. Co. at Chillagoe reports for the month of Octoher 1946 tons of ore containing 81 tons of copper, 12,074 ounces silver and 328 tons of lead were shipped to the smelting works.

Western Australia.

The 20-stamp mill at the Kinsella mine, one of the Murchison properties of the Cue G. M. & Exp. Co., near Cue, is in operation.

The scheme for testing the Bayleys mine at Coolgardie at depth provides for boring hy diamond drill from the 1000-foot point by means of five horeholes from Price shaft, about 2750 feet heing proposed.

The Perth hranch of the Royal Mint reports for month of September, 1903, and from Jan. 1, 1903:

Particulars. Receipts.	Month of Sep., 1903. Ounces.	Since Jan. Jan. 1, 1903. Ounces.
Western Australia	129,823.71	1,085,463.17
Other Australian States	.....	19.89
Foreign countries	.....	.....
Unknown origin	28.62	212.56
Worn British gold coin	.....	5.49
Total weight	129,852.33	1,085,701.11
Value of gold contained in the above, calculated at an average of £3 10s. 9d. per gross ounce of material received	£459,353	£3,840,668

The firewood carried by rail for the mines at Kalgoorlie is charged 1d. per mile per ton for a minimum distance of 16 miles, says the Western Australia Journal. The Kurrawang Co., the largest supplier, paid for freight for the two years ending July 31st last, £24,315. The Broad Arrow Co. paid £5619 for a period of seven months. The hulk of the railage for those companies, however, is done on private tram lines which feed the State railroad.

Now that things are settling down in this State to legitimate mining, says the London Mining Journal, the number of unemployed men is on the increase. The reason for this is not very far to seek. When the mines were first opened up, a great influx of all sorts and conditions of men took place; anyono who called himself a miner was sure of work. This class has been gradually weeded out, and since only skilled men are now wanted, they find themselves out of work. A large percentage of these take to a bush life, doing odd jobs at various mines in the Back Country, or else a little prospecting. It is surprising the large quantity of gold that is ohtained hy small parties of men who work a claim for a few months, until, with the appliances they have, they are unable to go deeper. The surface enrichment of reefs and lodes in this State is surprising, it being a common occurrence for parties of men to send parcels of stone to the public hatteries, and which yield as high as 50, 60, or even 100 ounces to the ton. These high values are mostly contained in narrow leaders of a few inches, and which do not continue in depth. This country is highly auriferous, and any day another Kalgoorlie may he discovered in the Black Range.

BRITISH COLUMBIA.

Ore shipments from the Granby mines to the smelter havo heen increased from 1200 to 2000 tons daily. The railroads are making an effort to supply cars and the motivo power to handle the increased tonnage hetwoen the mines and the smelter. There are now six furnaces in blast at the company's smelter at Grand Forks, giving the works the maximum daily capacity of 3100 tons. At tbe smelter the improvements made in the last few months havo been many, so that it now has the capacity to turn out blister copper at the rate of about 1,500,000 pounds monthly. Some increaso will be made in the working forces at hoth mines and smelter, whero 700 mon are omployed.

Boundary District.

The deal for the transfer of the Volcanic group of claims on the north fork of Kettle river, near Phœnix, has been closed hy Marquette, Mich., men for $90,000. W. A. Harkin of Grand Forks is resident agent of the company. A diamond drilling outfit is at work. In addition to this they have bonded the Evening Star group, in Wellington camp, on which work has been started. A wagon road will be huilt to connect with the main road and a test shipment to the smelter will be made. Both the Volcanic and the Evening Star have had some development work done. The Volcanic M. & D. Co. has been formed to develop the Volcanic.

S. Curtis, managing director of the Denoro mines, Ltd., that owns the Oro Denoro group, near Phœnix, says the ore is heing taken out and loaded on the railway dump cars at a cost not exceeding 40 cents per ton. This has been made possihle since putting in the compressor. The output is 150 tons per day, sent to the Montreal & Boston C. Co.'s smelter at Boundary Falls, and runs high in iron, serving as a flux. Work has centered in stripping the ore body exposed when the Phœnix branch of the C. P. R. was graded five years ago. From this point all the ore has been shipped thus far. The main ore body is 80 feet wide. After putting in the air compressor work was started in No. 3 tunnel at 200 feet from the portal to crosscut to reach the ore body, on which work is going on above. After going 80 feet the ore was cut. A raise will be driven to the surface, and connections made with the ore quarries. Surveys have heen run hy the C. P. R. to build a third spur, which will run under the dump from No. 3 tunnel.

Cassiar District.

The Canadian American M. Co. of Whatcom, Wash., has contracted with the Tyee smelter at Ladysmith to handle the output from the Empress group on Grihhell island. The company has been three years opening up these copper properties. The road from the beach to the mine has been completed. Development work has opened up the ore hody on the 300-foot level. The 480-foot tunnel to tap the ledge on the 400-foot level has not yet reached the ore hody, but will do so next month.

East Kootenay District.

Iowa men have formed the Gold River M. & P. Co., with G. E. Henderson of Beloit, Ia., president, and D. S. Guinter, superintendent. The company has a water right for 10,000 inches from Bull river, near Fort Steele, and has also leased several miles of placer ground. Superintendent Guinter is working sixteen, men prospecting and developing. Supplies have heen taken in for the winter. The right of way has been cleared for a flume for a mile, and the company intends to put in a sawmill to get out timber to allow the flume being huilt in the spring.

Rossland District.

The annual report of the Centre Star M. Co., operating at Rossland, issued last week, shows the company netted $265,000 on its mining operations, which, after paying off the company's debts, left a surplus of ahout $70,000 in the treasury. The future development, according to the report of Manager E. B. Kirby, will lie along the line of milling the low-grade ores. Kirby's report shows the ore sales during the year have heen 88,387 tons, averaging $10.58 smelter's gross assay value. The average assay contents were: Gold, 0.50 ounce; silver, 0.40 ounce; copper, 0.99%. The net profit in excess of all expenditures was ahout $265,000. The reserves of smelting ore at present are not large, and are of such shape that their dimensions cannot be accurately estimated. The development work of the year has continued to add to the masses of ore too low in grade for smelting, hut rich enough to afford a profit to successful milling. They occur in hodies 15 to 30 feet in width, and exposed imperfectly hy the mine workings, since these have in the past been directed to exposure of smelting ore hodies only. The values given are hased on the price of 12 cents for copper instead of 16.25 cents, as in previous reports. —— The fourth level, 431 feet in depth measured on the vein) east has heen extended to a point 690 feet from the shaft. At the 500 foot point the ore is 35 feet wide, averagging $5 smelter's gross assay value. The fifth levol (608 feet in depth west, at the 340 foot point, raise No. 595, has heen made on the vein to connect with the fourth level. The fifth level east has been extended to a point 358 feet from the shaft crosscut. From the 187 to the 217 foot point the ore is 8 feet wide, averaging $9.80 smelter's gross assay value.

F. Deitzsch, as consulting engineer, is conducting a series of tests with Giant mine ores of Rossland to ascertain the most economical method of handling the molyhdeuum and cohalt contained in the ores and lost in the ordinary smelting process followed thus far.——The Contact mine, in Burnt Basin section of Rossland camp, has forwarded another consignment of its ores to Swansea, Wales, to be tested for platinum and other metals of the platinum group. A number of tests conducted in England are reported to have shown that platinum exists in the ore in commercial quantities, the results secured indicating an average of a quarter of an ounce of platinum per ton of ore. With the platinum are iridium and osmium. The contact bas a lead of ore running $10 in gold and silver and is a concentrating proposition, irrespective of the presence in the ore of the platinum metals.

Sixth level (778 feet in depth) main east has heen extended to a point 1060 feet from the shaft crosscut. At the 934-foot point an ore hody begins, 20 feet in width and averaging $20, smelter's gross assay value.

Slocan District.

The Wakefield concentrator, near Silverton, is closed down for the winter after a successful run. The concentrator has turned out two products; a lead concentrate running 65% lead, 9% zinc and 125 ounces of silver; and a zinc concentrate running 45% zinc, 2% lead and 70 ounces of silver to the ton. The lead product was shipped as produced and smelted in the local smelters. The zinc product has not yet been shipped, hut there are 200 tons at the wharf that will go to Iola, Kans. There is as much more stored at the mine, which will not be shipped till next year, in hope that better treatment rates will be obtained. During the winter the Wakefield mine will continue development work with fifteen men and block out more ore. —— The Comstock mines are hauling their own ore down. There are four cars of ore sacked at the mine ready for shipment that will run 45% lead and 85 ounces silver.

CANADA.

Alberta.

A. C. Flumerfelt of Grand Forks, president of the International Coal & Coke Co., operating at Coleman, says he is preparing to put in machinery to enable the colliery to prodnce 2000 tons of coal daily. This will also include the huilding of the initial battery of 104 coke ovens. Electricity will be the motive power in and around the mine. Work on construction will be started in January. The grading of the railway switches to the mines and the construction of the first battery of 104 ovens are in progress. By spring they expect to have a payroll of 600 men at Coleman. There are fifteen buildings under construction, and the payroll numhers 200 men at present, with tho output of the mine at 100 tons of coal daily.

CHILE.

United States Consul R. E. Mansfield at Valparaiso writes the production and exportation of nitrate, the world's supply of which comes chiefly from Chile, is regulated and controlled by an association with headquarters in Valparaiso. The association has issued a circular, from which the following figures are taken: For 1902-3, the oxportation quotas amounted to 1,668,486 tons. On March 31, 1903, the stock on the coast was given at 269,923 tons, and that ahroad at 518,136 tons—a total of 788,059 tons. In course of half the year five new works joined the association, making in all twenty-four "officinas," or producing plants, operating under the combination. The twenty-four plants, or officinas, with the production allotted for the year, as as follows:

Officina.	Production. Tons.
Lagunas	35,000
Keryma	9,000
Mapocho	17,500
Mercedes	10,750
Angela	28,350
Esperanza	18,000
Rica Aventura	66,000
Pepita	57,600
Camina	30,000
Sloga	13,800
Sebastopol	9,250
Pan de Azucar	30,000
Grutas	44,000
Empress	66,000
Recuerdo	19,200
Palmira	7,150
San Lorenzo	27,500
Naprled	5,750
California	30,000
Dalmacia	14,500
Slavonia	14,000
Ballena	40,000
Lastinia	52,000
San Enrique	10,000
Total	655,350

To this total there will be added quotas for the following plants or officinas, which are ready to enter the combination: Jaspampa Bajo, Chile, Alemania, Esmeralda, Florencia, and Cota; in addition to which are to he reckoned the output of several intended new works and those which may be opened on the Government nitrate grounds sold in Novemher.——The total exportation for 1903-4 has heen fixed at 1,625,000 tons.

The consumption of nitrate is increasing in the United States. The Argentine Republic, in which are cultivated 6,000,000 hectares (14,826,000 acres) will, in the future, require large quantities of nitrate to maintain the fertility of its farm lands. It has been claimed that the scarcity of labor may affect the output of nitrate. It is estimated that each laborer in the works produces fifty-five tons of nitrate per year. For various reasons the quantity produced by each laborer has decreased 30% since 1880. But there seems little danger of a scarcity of labor in the nitrate fields. In some of the provinces wages are very low, which is an indication that there is small demand for well-paid labor. The hetter class of workmen in the nitrate works receive on an average 6 pesos ($2.19) per day. This fact is sufficient to attract laborers from other sections of Chile and from Peru and Bolivia, where wages are only 60 to 80 cents Chilean currency (22 to 29 cents) per day, when the demand comes for a greater number of workers in the nitrate fields. ——The exportation of nitrate is taxed at $3.38 pesos Chilean gold ($1.19) per metric quintal.

INDIA.

The Burma Ruhy Co. reports during month of October 148,000 loads washed, producing rubies valued at 103,000 rupees ($49,955); royalties, 22,000 rupees ($10,670).

KLONDIKE.

Superintendent Temple, engaged hy the Government, will hegin his Yukon work with diamond drills this month, says Commissioner Congdon. It was intended to begin on the copper properties at White Horse, hut a change is considered, Congdon says, the most logical place at which to begin work with the diamond drill in the Klondike heing where the property already located and held by companies or individuals is the most promising and developed most. Of the quartz properties in the Klondike proper, the Violet group is making favorable showing. A large number of applications for work on quartz properties with the Government drill have heen made to the commissioner. The Government has a diamond drill at White Horse and one at Dawson. It is possible that Superintendent Temple will do some prospecting work for the Government, in time, with placer drills, such as are used in California and elsewhere, and which were introduced in the Klondike this summer hy two companies. Howevor, quartz devolopment is the chief object at which the Government is aiming at present.

MEXICO.

Campeche.

W. J. Fisher, having oxplored the oil lands of Campeche, Tahasco and the isthmus of Tehuantepec, says he has located 250 acres near San Pedro and will begin drilling operations.

Chihuahua.

The mines of Parral, Minas Nuevas and Santa Barbara employ hetween 8000 and 9000 men, says the Enterprise. The Montezuma Land Co. at Sauta Barhara employs 1200, and a numher of others employ several hundred each. These mines are largely owned by American capital.

At the Americano mine at Terrazas work is going on in four breasts of ore of good grade. There were seventy more miners put on this week, so as to increase operations.

A. P. Johnson and T. L. Owings, of Denver, Colo., aro reported to have organized a company and are beginning operations on two properties in Guaynopa section, 60 miles from Nuevas Casas Grandes.

Coahuila.

The Cahrillas mine, owned by Zambrano Bros., on the National Railroad, near the Nuevo Leon State line, has been oquipped with a steam hoisting plant of fifty tons daily capacity. The ores are lead-silver-iron, which are said to he dosired hy the smelters.

Guerrero.

F. A. Heinze of Butte, Mont., is reported to have taken an option on the Ladichs copper mine, owned hy the Mitchell M. & S. Co.

Mexico.

At the Sullivan mine, at El Oro, the two compartment vertical shaft is down 230 feet, and sinking continuos through the andesite capping. The equipment consists of 10x14 steam hoist and one 80 H. P. boiler, and will ho increased hy addition of a pump and a 40 H. P. boiler, says manager H. W. Benton.

Thore are twenty iron furnaces in operation throughout Mexico, hosides the plant at Monterey, with a combined capacity of less than 60,000 tons per annum. The limit to the supply is determined hy the quantity of wood available for charcoal, the product of these furnaces being wholly charcoal iron, says the Mexican Investor. The cost of pro-

ducing pig iron from charcoal furnaces is estimated at from $20 to $25 and bars at $40 to $50 per ton. The chief obstacle at this time is transportation.

Oaxaca.

The Juanita M. Co. has been organized in Mexico City to operate the Juanita mino, in Oaxaca, by G. M. Houstou, J. Lane, G. P. Hupp, M. Blum, E. Murray and W. J. McCammon.

It is reported that C. Frank of Ejutla, for Chicago, Ill., men, has bought the Soledad mine in Ejutla district for $30,000. The property consists of three pertenencias. It is claimed the ore runs 400 ounces silver per ton.

Sonora.

W. C. Olds of Eric, Pa., of the Hays Con. M., M. & L. Co., operating at Camp Hayes in the Pinito mountains, says work is progressing on the 30-stamp mill being built by Manager D. J. Duncan.

The Brady-Levin Co. has bought the La Higuera group of gold mines, 30 milos southeast of Magdalena in Magdalena district. The group comprises six claims, containing eighty pertenencias of ground. The Higuera is an antigua property on which 1500 feet of workings have been made. There is a 5-stamp mill in operation on the property.

Manager Tennant of the Sonora River Placer M. Co. says work was started last week on their holdings near Cananea, says the Cananea Herald. The company has put in an extensive equipment for water service.

Vera Cruz.

The Oil Fields of Mexico Co. has been organized under laws of Delaware to develop oil lands 40 miles inland from Tuxpan, on the Gulf of Mexico.

Zacatecas.

The San Luis del Oro mine, 2 kilometers south from Zacatecas, in Zacatecas district, is being developed through four vertical shafts, one being 220 feet deep, one 130 feet in depth, and the other two are each 150 feet deep. They are equipped with a 20-stamp mill, two steam hoists, one pump, two engines, four boilers, and a 50-ton cyanide plant. The reduction plant is not in operation, but development work is in progress, and the company expects to start up the mill in the spring. E. Savilla is manager.

SIAM.

Rubies and sapphires were exported from Siam during 1902 to the value of £3701, being £14,490 below the value of this item in 1901, says British Vice-Consul Lyle at Bangkok. The fall is said to be due to low prices prevailing in the London markets. The returns for 1903 are expected to show a recovery.

Obituary.

WILLIAM STEVENS, a pioneer miner of Grass Valley, Cal., died on the 26th ult., after an extended illness. He is survived by a wife and six children.

J. W. VIRTUE, a pioneer miner of the Pacific coast, who formerly owned the Virtue mine, near Baker City, Or., died at Portland, Or., on the 27th ult. of liver complaint.

WILLIAM JUREY, a pioneer miner of Nevada, died at Galena, Nev., Nov. 17th, from heart trouble. Deceased was born in England, aged 62 years, and leaves a wife, two sons and a daughter.

J. P. COCHRAN, a pioneer miner of California, and from 1864 till 1868 receiver of the United States Mint in San Francisco, died Nov. 26th, aged 76 years. Deceased was a native of Pennsylvania and went to California in 1850.

Books Received.

"Irrigation Engineering," by Herbert M. Wilson, C. E., is the title of the fourth edition of the work on this subject. It treats of the precipitation, runoff and stream flow of water; evaporation, absorption and seepage, drainage and sedimentation; flow and measurement of water in open channels, etc., canals and canal works; application of water and irrigation; storage reservoirs, dams and their construction, pumping, etc. It also contains numerous valuable tables; profusely illustrated; 573 + XVII pages; $4. John Wiley & Sons, New York; Chapman & Hall, Ltd., London.

Dividends.

Bunker Hill & Sullivan M. & C. Co., Idaho, $30,000, payable Dec. 4th.

Personal.

G. DUNCAN has returned to Deadwood, S. D., from Denver, Colo.

G. MCCARTY, interested in Mexican mines, is in San Francisco, Cal.

H. GATES is in San Francisco, Cal., from a trip to Mexico on mining business.

J. H. MACKENZIE of San Francisco, Cal., has gone to Alaska on mining business.

J. HISLOP of Fort Steele, B. C., is mining recorder for the Fort Steele mining division.

T. J. EVANS of Cananea, Sonora, Mexico, is in San Francisco, Cal., on mining business.

HOMER WILSON of San Francisco, Cal., has gone to New York City on mining business.

R. F. PEARCE of Denver, Colo., interested in Colorado mines, is in San Francisco, Cal.

M. F. GRAUPNER of Douglas, Ariz., has returned there from a trip to San Francisco, Cal.

C. S. KINC is now assayer at C. A. Luckhardt & Co.'s, 73 Stevenson street, San Francisco, Cal.

F. DIETZSCH of London, England, is consulting engineer for the Giant mine near Rossland, B. C.

J. D. HARDIN, president of the Branch Mint Co. of Galena, Lawrence county, S. D., is in the East.

P. CLARK, of Spokane, Wash., interested in Oregon and Washington mines, is in San Francisco, Cal.

J. E. KING of Mokelumne Hill, Calaveras county, Cal., is in San Francisco, Cal., on mining business.

JOHN ROSS, JR., has returned to Sutter Creek, Cal., from an examination of mines at Grant's Pass, Or.

MANAGER HOOPER of the Echo M. Co. made a short trip to Randsburg, Cal., last week from Los Angeles, Cal.

J. M. BLYTHE, secretary of the F. M. Davis Iron Works Co., has returned to Denver, Colo., from California.

A. LAJUNE of Gunnison, Colo., is superintendent of the Jimmy Mack mine, near Tin Cup, Gunnison county, Colo.

F. JARDINE has resigned as superintendent of the Martha Washington mine, near Eureka, Juab county, Utah.

I. J. COLE, manager and superintendent of the Pine Hill mine, near Auhurn, Cal., has gone East on company business.

E. C. ENGLEHARDT, M. E., has gone from Denver, Colo., to Cave Creek, Ariz., on a three months' professional visit.

D. E. BUCHANAN is superintendent of the I X L mill in the Greenhorn mountains, near Greenhorn, Baker Co., Or.

V. H. BEHNE of Portland, Or., has been appointed manager of a group of coal properties in Muhlenhurg county, Ky.

W. O. MORRISON of the Deadwood Standard M. Co., near Lead City, S. D., returned last week from Denver, Colo.

J. SCHMIDT, formerly engineer at the California mine, Lake City, Colo., is now with the Detroit Copper Co., Morenci, Ariz.

JOHN B. FARISH, E. M., of Denver, Colo., has returned from an Eastern trip and has gone to Mexico, via San Francisco, Cal.

W. L. BOWRON of Los Angeles, Cal., is mill superintendent of the Millspaugh mill and cyanide plant at Millspaugh, Inyo county, Cal.

E. W. NOAKES of Chicago, Ill., treasurer of the Tinton Tin Co., has returned from visiting their mines at Nigger Hill, Tinton, S. D.

F. E. WADE, general manager of the Globe G. M. Co. of Lead City, S. D., made a trip last week to Denver, Colo., on company business.

W. C. OLDS of Erie, Pa., of the Hay's Con. M., M. & L. Co., operating in Sonora, Mexico, has returned from a trip to their mines.

SAMUEL NEWHOUSE of Salt Lake City, Utah, has gone to London, England, to attend a stockholders' meeting of the Boston Con. M. Co.

J. M. SHERRARD, manager of the Taylor Iron & Steel Co., Highbridge, N. J., who has been sojourning in California, has returned home.

PRESIDENT E. L. WHITE of the Bingham Con. M. Co. returned last week to Boston, Mass., from Salt Lake City and Bingham, Utah.

T. MALTMAN returned to Angels, Cal., last week from Nome, Alaska, where he went to superintend the work of the Anvil Sunrise M. Co.

A. MATTHIESSEN, of Keystone, South Dakota, has gone to Breckenridge, Summit county, Colo., as superintendent of the Jessie mines and mill.

H. F. WELLS, treasurer, and E. F. Woodworth, manager of the Lexington Hill M. Co., have returned to Lead, S. D., from a business trip to Denver, Colo.

SUPERINTENDENT T. A. VARDEN of the Ohio Copper Co. of Bingham, Utah, has returned from Salt Lake City, after conferring with Manager Q. A. Tibbetts.

G. E. LADD of Rolla, Mo., is superintendent of the Missouri mines and metallurgy exhibit for the St. Louis Exposition, vice H. H. Gregg of Joplin, resigned.

W. B. MUCKLOW of Hartford, Conn., has resigned as president of the Majestic C. Co., operating at Milford, Utah, and is succeeded by A. H. Loomis of New York.

E. E. REYNOLDS of Wilkesharre, Pa., has been appointed general superintendent of the International Coal & Coke Co., operating at Coloman, Alberta, Canada, the duties of which he will assume Jan. 1.

RICHARD HAMILTON of Kalgoorlie, Western Australia, and J. Edwards of London, Eng., general manager and secretary, respectively, of the Great Boulder Proprietary mine, near Kalgoorlie, are investigating mining operations in Colorado.

Commercial Paragraphs.

THE San Francisco, Cal., office of the General Electric Co. is now in the Crossley Building.

THE Redfield Drill Co. of Denver, Colo., has shipped three of their hand power rock drills to Keller, Wash., one each to Burke, Idaho, and Black Hawk, Colo.

THE Victor Engine & Motor Carriage Co., Mr. Prescott Scott manager, has factory facilities at 252 Spear street, San Francisco, Cal., where offices and headquarters are now established.

C. M. FUELLER, 1752 California St., Denver, Colo., has a telegram from Dover, Frank & Co., Grover, N. C., instructing him to draw plans and specifications for a 50-ton concentration and cyanide mill for erection at that point.

J. W. RICHARDS, assayer and chemist, has moved into his new quarters at 1732 Champa street, Denver, Colo., his increasing business necessitating more commodious rooms. Mr. Richards was for a number of years assayer in Aspen, Colo.

THE Union Iron Works of San Francisco, Cal., reports the usual successful trial of another fine new vessel for the United States, this time it being the official trial trip of the cruiser Tacoma in Santa Barhara channel, where on the 30th ult. she exceeded the requirements of the Government for a developed speed of 16.5 knots, attaining a speed of 16.62 knots. The four hours' run was in every way a success.

THE J. G. Leyner Engineering Works Co. kept open house to their friends and patrons in the afternoon and evening of Nov. 25th at their new offices and salesroom, 501 Seventeenth street, corner Glenarm, Denver, Colo. Refreshments were served to a large company of friends, patrons and competitors. The growth of their business during the past four years has necessitated larger and more commodious quarters, and their space requirements for office and salesroom is three times as great as that occupied by their entire factory four years ago. In future they will be in a position to furnish complete mining and milling plants. Heretofore they have only carried the Leyner compressors and rock drills.

THE G. W. Price Pump Co., San Francisco, Cal., reports the following recent installations of its centrifugal pumps: Union Sugar Co. of California, three pumps with 10-inch discharge (one to raise 3500 gallons per minute 85 feet, with 100 H. P. steam, oil-burning plant; one for 3000 gallons, 75 feet, with 75 H. P. gasoline engine; one for 3000 gallons, 30 feet, 30 H. P. gasoline); F. J. Bowne, Oregon, 12-inch pump, to raise 5000 gallons per minute 20 feet with 50 H. P.; an 8-inch discharge, direct-connected electric motor, to raise 1500 gallons per minute 140 feet; W. H. McCain, California, 155 gallons 90 feet with 7½ H. P. motor. Also, the Price Co. has in preparation for W. E. Dargee, California, for irrigating, one 10-inch pump, to raise 3500 gallons per minute 117 feet with 125 H. P.; for Norcross, one 360-gallon and one 250-gallon capacity per minute, each to raise 40 feet; and for Chicago, Ill., parties a 6-inch pump, direct-connected to 40 H. P. induction motor, to raise 1000 gallons per minute 100 feet.

Catalogues Received.

The Kingsford Foundry & Machine Works, Oswego, N. Y., forward a carefully compiled catalogue of their centrifugal pumping machinery, with illustrated explanation in detail.

The catalogue of the Woodward Governor Co., 658 Race street, Rockford, Ill., shows in detail the compensating type for electric light, power and railway service, and the standard type for mill and factory use, minutely describing the mechanism.

Armstrong Bros. Tool Co., 617-621 Austin Ave., Chicago, Ill., send a handsome pamphlet, catalogue No. 10, showing how time, money, labor and worry can be saved by using the Armstrong tool holders, obviating danger of steel being burned or worked badly, and effecting economy in tool use throughout.

Catalogue No. 52 from the Jeffrey Manufacturing Co., Columbus, Ohio, is a fine compendium of information on coal washing machinery, in which the Jeffrey Co. have deserved prominence. They also therein direct attention to their elevating, conveying, power transmission, screening, crushing, coal cutting, drilling and hauling machinery. Frank R. Field, Equitable building, Denver, is their Colorado representative.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific Coast inventors:

FOR WEEK ENDING NOVEMBER 24, 1903.

744,992.—ROASTING FURNACE—D. D. & J. O. Bailey, Banner, Cal.
744,991.—PLASTIC COMPOUND—Rosa H. Boyd, Seattle, Wash.
745,035.—HARVESTER — J. H. Brammer, Hunters, Wash.
745,150.—GLOVE—F. H. Busby, S. F.
745,037. — GAS GENERATOR — C. A. Butler, Port Townsend, Wash.
744,907.—TRUCK—P. Dahle, Eureka, Cal.
745,043. — STEAM BOILER — W. Dobler, Sumner, Wash.
745,169.—ORE FEEDER—C. Z. Ellis, Berkeley, Cal.
745,047.—AMALGAMATOR—Fletcher, Davis & Douglass, St. Clair, Nev.
744,750.—PRESERVING EGGS — J. W. Green, Portland, Or.
745,185.—BICYCLE—C. G. Hightower, San Mateo, Cal.
744,767. — ELEVATOR — J. W. King, Waitsburg, Wash.
745,021.—VIBRATOR—J. J. Lewin, Palo Alto, Cal.
744,925.—DRILLING TOOL—D. L. Luddington, Grass Valley, Cal.
744,774.—VEGETABLE GRATER—H. H. Lyon, Riverside, Cal.
744,783. — CAMERA — W. E. Mulhollan, Juneau, Alaska.
745,233.—WATER WHEEL—L. Oliver, Ontario, Or.
744,877.—CARBURETOR—E. D. Parrott, Portland, Or.
745,077.—RHEOSTAT—W. A. Sherlock, S. F.
745,126.—PLASTERING TOOL—W. A. Warsoo, Seattle, Wash.
745,128. — ELECTRIC TREATMENT — L. Williams. Seattle, Wash.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

MOVEMENT CURE APPARATUS.—No. 745,021. Nov. 24, 1903. J. J. Lewin, Palo Alto, Cal. The object of this invention is to provide a vibrating arm and a means for regulating or stopping the stroke and the intensity of the vibration. It consists in the novel arrangement of an electro magnet, an armature, a peculiarly constructed contact making and breaking spring upon which the armature is carried, and a curved arm having a rounded knob or point upon the end carried by the armature, and in conjunction with this of a regulating arm and stop. The device is especially applicable to apparatus for the treatment of the skin by the action of the vibrating arm.

ROASTING FURNACE ATTACHMENT.—No. 744,992. Nov. 24, 1903. D. D. Bailey and J. O. Bailey, Banner, Cal. The object of this invention is to provide an apparatus in which the ore is fed to a roasting furnace through a conducting pipe, which is inclosed by a flue carrying the heated products of combustion from the furnace, so that the ore is gradually raised in temperature as it approaches the furnace, while it is roasted, and is continued through the pipe to an amalgamating device carried with the pipe and provided with a scrubbing or polishing device. The upper end of the ore conveyor is connected with a feed apparatus and beyond this with devices by which a sufficient vacuum is produced to withdraw any fumes produced by the roasting and convey them to a condenser.

FISH CUTTING MACHINE.—No. 743,742. Nov. 10, 1903. Wm. Munn, San Francisco, Cal. This apparatus is designed for cutting and slicing fish, particularly salmon, preparatory to canning. The object of the invention is to provide a simple practicable cutting machine of the type employing a series of rotary cutters. It is directed particularly toward providing a means for supporting the fish in relation to the cutters, so that the difficulty heretofore experienced in holding the soft fish up to the knives will be obviated.

Latest Market Reports.

SAN FRANCISCO, December 4, 1903.

METALS.

SILVER.—Per oz., Troy: London, 27¼d (standard ounce, 925 fine); New York, bar silver, 56¾c, refined (1000 fine); San Francisco, 56¾c; Mexican dollars, 46@47½c San Francisco, 43½c New York.

The London price for silver remains unchanged from last week's quotations, while New York and San Francisco prices are nearly 1 cent lower. No considerable rise in price can now be expected before the Government again enters the market as a large buyer.

COPPER.—New York: Standard, $12.50; Lake, 1 to 3 casks, $12.50; Electrolytic, 1 to 3 casks, $12.50: Casting, 1 to 3 casks, $12.50; San Francisco: $15.00. Mill copper plates, $17.00; bars, 18@24c. London: £55 spot per ton.

The copper market remains weak and practically unchanged. It is predicted in Eastern markets that the price will not go below 12 cents, while no immediate rise above 13 cents is looked for. The halt in industrial activity, due largely to the unsettled attitude of labor to capital, has caused a marked falling off in construction, and with it the demand for copper, mostly in the form of wire for electrical use. If the large producers attempt to find a market for their metal by offering lower than open market prices, a heavy slump may be looked for, and there is some anxiety on this score in copper circles.

LEAD.—New York, $4.25; Salt Lake City, $3.50; St. Louis, $4.00; San Francisco, $4.50, carload lots; 4¾c 1000 to 4000 lbs.; pipe 6½, sheet 7, bar 5¾c; pig, $4.75. London: £11 1s 6d ℔ long ton.

SPELTER.—New York, $5.25; St. Louis, $5.10; London, £20 10s ℔ ton; San Francisco, ton lots, 6¾c; 100-lb. lots, 7c.

TIN.—New York, pig, $25.80 @ 26.00; San Francisco, ton lots, 27c; 500 lbs., 28c; 200 lbs., 28c; less, 28½c; bar tin, ℔ lb., 30@32c. London, £119.

PLATINUM. — San Francisco, crude, $18.00 ℔ oz.; New York, ingot, $19.00 ℔ Troy oz. Platinum ware, 75 @ 80c ℔ gram.

QUICKSILVER. — New York, $46.00@47.00, large lots; London, £8 7s 6d; San Francisco, local, $43.50@44 ℔ flask of 76½ lbs.; Denver, $49.50. Export, $42.50@43.00.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 35c; Eclipse, 37½c.

SOLDER. — Half-and-half, 100-lb. lots, 18.00c; San Francisco, Plumbers', 100-lb. lots, 15.25c.

ZINC.—Metallic, chemically pure, ℔ lb., 50c; dust, ℔ lb., 10c; sulphate, ℔ lb., .04c.

NICKEL.—New York, 50@60c ℔ lb.; ton lots, 40@47c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30@34c.

ANTIMONY. — New York, Cookson's, 7½c; Hallett's, 6¾c; San Francisco, 1000-lb. lots, 8c; 300@500-lbs., 8½c; 100-lb. lots, 10½c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, $15.35 @15.85; gray forge, $13.35; San Francisco, bar, 3c ℔ lb., 3½c in small quantities.

STEEL. — Bessemor billets, Pittsburg, $23.00@23.00; open hearth billets, $23.00 @23.00; San Francisco, bar, 7c to 12c ℔ lb.

URANIUM.—Oxide, ℔ lb., $3.50.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

PHYSICIAN, WHO IS ALSO METALLURGICAL Chemist, wishes position as mine surgeon and assayer. Accustomed to base ores. Best references, character, ability. Speaks Spanish. Good location desired more than large salary. Address Dr. Porter, this office.

MACHINERY FOR SALE.

For Sale--Thirty Bottom Dump Cars,

ALL STEEL, ENTIRELY NEW. CAPACITY 5 CU. YDS, STANDARD GAUGE.

These cars set very low to track and can be readily loaded by hand. Suitable for handling stone, ore, shale, marl, or other material. An excellent car for contractors' use. Shipment can be made within 30 days. For further information, write

THE ATLAS CAR & MFG. CO., Cleveland, O.

Manufacturers of Steel Cars and Industrial Railway Equipment.

For Sale Cheap.

Offers Wanted for Any of the Following:

Air Compressor, 12"x12", Laidlaw-Dunn, belt driven, new.
35 H. P. Horz. Tubular Boiler, complete; will be tested to 150 lbs. pressure; first-class condition.
Portable Drilling Outfit, suitable for prospecting or water wells; good condition.
Douglass Pump, No. 6, force feed, never used.
Iron Turntable, 7 ft. diam., having two 30" gauge tracks.
Two Mine Water Buckets, 54 gals. capacity, complete with valves.
One Ore Skip, body 36" top, 48" bottom, 30" high, 24" wide.
5 H. P. "Almond" Right Angle Coupling, new.
Barrett Swivel Wrench, good condition.
6 H. P. Gasoline Hoist.
Two 5" Genuine Jenkins High Pressure Globe Valves.

Address Box 42, Mining and Scientific Press, San Francisco, Cal.

A COMPLETE CONCENTRATING PLANT

Can be bought at 12c on the $1. The machinery is of the highest type and in good condition.

One 200 h. p. Corliss Type Engine. Two Safety Tube Babcock & Wilcox Boilers, about 250 h. p. One 800-lb. High Mortar 40-stamp Mill, rapid drop. One 9x15 in. Blake Crusher. Eight Tullock Automatic Ore Feeders. Twelve Double-end 3-Compartment Hartz Jigs. One 4-Compartment Single Hartz Jig. Six Sets Revolving Screens, all housed in. Two Sets of Elevators, complete. All necessary Shafting, Pulleys, Boxes, Belting and most of the piping, etc. This plant has been used very little. It cost $100,000; if sold at once, will take $12,000 for it. Located on the D. & R. G. Ry.

S. S. MACHINERY COMPANY,
1529 Lawrence St., Denver, Colo.

SECOND-HAND MACHINERY FOR SALE.

4—5-ft. Huntington Roller Mills, complete.
3 Willfley Concentrating Tables.
1 Woodbury Concentrating Table.
1—4-ft. Pelton Water Wheel.
1—8x12-in. Rock Crusher.
1—30-ft. Hydraulic Elevator, complete.
1—1-ton Rock Car.
800 ft. Pipe, 1 in. to 4 in.; 200 ft. Rail.
1 Oertling Assay Balance, fine order.
1 pair Bullion Scales.
1 Platform Scale.
300 Sulphuret Sacks (new).

The above plant is complete and in fine shape, and will be sold as a whole or in part at half the original cost. We have ten times this amount of mining machinery on hand.

JARDINE MACHINERY COMPANY,
220 FREMONT STREET, SAN FRANCISCO, CAL.

FOR SALE.

1 Ingersoll-Sergeant Air Compressor, 18x16x18.
1 Ingersoll-Sergeant Air Compressor, 12x10x12.

The Duty of a Stamp Mill.

An important consideration with a mine manager is the duty of the stamp mill. After years of experience it is found that this duty varies greatly, even in the same district. With some managers the chief object appears to be high capacity—this is particularly noticeable on the Rand, South Africa, where the average duty of a gravity stamp is rather over than under five tons per twenty-four hours. California has made some record runs in the way of large capacity, as high as seven tons per stamp having been recorded, but this was on soft, decomposed amphibolite schist, with just enough free quartz to cut the fine, soft material, and as the gold was comparatively coarse and a 400-mesh screen—twenty holes to the linear inch—was used with abundance of water, the amount put through per stamp was large. This was at a mine near Angels, in Calaveras county.

From four to five tons per stamp is not an uncommon stamp duty in California mills, and about the same amount is run through in some of the Homestake mills of South Dakota, also those of Alaska. In fact, nearly all of the large low-grade mines must crush a large tonnage per stamp in order to reduce the cost of milling. If a 40-stamp mill crushes four tons per stamp through a 40 screen at a cost of 80 cents per ton of ore crushed, and by substituting a 30 screen for the 40, the capacity is increased one ton per stamp per twenty-four hours, the cost of running the mill will remain practically the same, but the cost per ton of ore crushed will be reduced to 64 cents. The question then arises, have the tailings increased in value to an amount equal to the decrease in cost of milling per ton? If not, then the change is advisable and the mortars should all be supplied with the coarser screen. If on the other hand the loss in tailings rises to about the same figure as the saving in cost it is not advisable to make the change, while if the values in the tailings rise above the difference in cost of milling it certainly would be a bad change. A higher capacity may then possibly be secured in some other manner, while the values in the tailings may still be kept down to about the same figure as before. One method of accomplishing this is by crushing the rock finer in the breakers. The smaller the maximum of size as the ore comes from the breaker, the greater the capacity of the stamps within certain limitations. As a rule the rock breakers do not do as much work as should be required of them. In some mills the breakers are only run a few hours each day, and the maximum size of pieces of ore going to the batteries are often so large as to be unable to pass the lip of the feed slot at the back of the mortar. If the crusher be set to crush finer the capacity of the mill will at once be increased. If the ore coming to the mill gains upon the breaker man, then a different arrangement must be provided. Breakers set tandem will increase capacity largely.

Where all the ore from the mine, after being run through a large breaker, which crushes it to pass, say a 3-inch ring, falls on a grizzly which sizes it roughly to 2 inches, the coarse product going to a smaller breaker for finer crushing, it will be found to accomplish a wonderful saving by increased capacity of the stamps. This is a feature of mill practice which many mill men seem slow to recognize. In a 40-stamp mill, where rock of uniform grade was fed to the stamps, several experiments were tried with screens of varying size and different heights of discharge. It was found that a 30-mesh screen, with a 6½-inch discharge, crushed four and one-quarter tons per twenty-four hours. An adjoining mortar, with a 40-screen and 3-inch discharge, crushed as nearly as could be estimated the same amount of ore, but the tailings were about 10 to 15 cents lower than on the higher discharge battery. This indicated that the ore required the finer crushing to release the gold bound up in the quartz and pyrite. In a case like that cited it is wisdom to adopt the finer screen and low discharge, but in another mill on different ore similar experiments may not produce the same results. Experience has shown that a quartz mill is a poor place to apply the "rule of thumb." Each case should be given the advantage of experiment. The simple fact that each stamp in a mill is crushing four tons per twenty-four hours, and that 92% of the values are being saved, does not prove that by altering the running arrangements of the mill it will be impossible to secure better results by still finer crushing and at the same time keep up or increase capacity. An increase in mill capacity without increase in value of tailings means a lowering cost of milling.

Often the ore of a mine is of such character that large tonnage per stamp is impossible without heavy losses in the tailings. Some mills do not crush over 1½ to 2 tons per stamp. This is because the rock, while requiring fine crushing, is very hard and flinty and difficult to amalgamate. In such cases it is, doubtless, economy to reduce the capacity per stamp and save as high a percentage of values as possible. Increase in mill capacity may always be obtained by increasing the number of stamps. It is safe to say that in a large mill ore may be treated at lower cost per ton than in a small one, for the reason that the ratio of expense per ton is less in a large mill than in a small one. The crew required to run a 5-stamp mill may also run one of ten stamps, and the crew of a 40-stamp mill may usually operate one of sixty stamps. Power generally costs less per unit; fewer men are required per unit; and the original capital expense per unit is less—the unit being either the stamp or the ton of ore crushed. In addition to the above considerations, there are other important factors which influence the duty of the stamp mill. These are quantity of water fed in the battery; inclination of the battery screen; the superficial area of screen surface; the height of drop and number of drops of stamp per minute. The weight of stamp varies somewhat with the wearing down of the shoe, but this is in a measure equalized by the increasingly higher drop which results as the shoe wears away. Careful millmen keep the drop as nearly uniform as possible by adjusting tappets.

One thing which is an essential in the stamp mill practice is uniform water feed. This can best be supplied by providing a pressure box outside the mill which is fed with an unfailing stream of water. This box should constantly be furnished with an amount of water somewhat in excess of that used in the mill, having an overflow near the top. The waste water may flow into a separate adjoining tank, this water being conducted by separate pipe to the hose in front of the battery, to be used in washing off the outside plates, etc. This arrangement affords a uniform pressure at the battery. It is also a good idea to provide the battery water feed with two stop cocks, one of which is adjusted to the maximum flow, set by the mill foreman, the other to be manipulated by the battery men at will. This admits of shutting off all water, but does not permit more than in the foreman's judgment is necessary for the best work.

THE increasing development of the mineral resources of South Africa is calling for more extensive application of electrical machinery, and American manufacturers are in the field and expect to make large installations in that region during 1904. The gold output is growing larger with each month, though it has not reached the magnitude it had assumed prior to the Boer war.

THE copper market shows signs of weakness, the anticipated rise in price not having materialized. The output for the year has been large, and the consumption has practically been equal to it; but still the market has slowly declined, and it is now at 12½ to 13 cents, with indications for a still lower price. The disturbed industrial condition of the country and lack of confidence on the part of investors is responsible to a great extent for the present condition of the copper market. Numerous anticipated electric installations and extensions have not been made, because of uncertainty of labor conditions, and copper has not been in as great demand as was expected a few months ago.

AS indicating the march of progress in British Columbia, the statement is made that rock which some time since was dumped in the workings of the Lenora mine of the Mount Sicker Copper Co. for filling, is now being drawn out and treated in the smelter for the gold it contains. When the ore was mined from the stopes of the Lenora, it was assumed that it was copper ore, and that, believed to be too low in copper to be profitably treated, was sorted out and used to support the walls of the stope. Presumably in testing the ores for copper, the volumetric assay was employed, and this gives no indication of the presence of gold. Recently it was found that this waste rock carried gold in considerable amount. This illustrates in a marked manner the necessity for careful tests for other metals than copper in so-called copper ores.

A Tempest in a Teapot.

The United States Land Office at Washington has made a ruling that a patented claim shall refer its lines to the lines established by the Government land surveys in the several Western States, and the ruling has been and still is the cause of much unnecessary anxiety on the part of those owning patented mining claims.

All who are familiar with the methods of Government land surveys and their results are aware that many of these lines are not true North-south or East-west courses, and that many other discrepancies exist; but this fact and the ruling of the land department need cause no serious uneasiness on the part of those owning patented claims. In Colorado, particularly, a great deal is being said about the matter, and the opinion is expressed that the land department is about to involve the entire mining region of the West in interminable litigation, by shifting the claims about into new positions, in the effort to make the descriptions of the claims conform to the land survey lines.

Nothing of the sort is contemplated, and, if it were, the land department has no authority to float mining claims from one position to another at will. When the land department has issued a patent to a mineral claim, that claim passes beyond its jurisdiction. The stakes or monuments are necessarily prima facie evidence of the limitations and boundaries of the claim. Concerning this "Lindley on Mines" says:* "It may be announced as a general rule that a patent is conclusive evidence as to the limits of a location, and that it can not be assailed by showing that its actual boundaries were different from those described in the patent. Nor are the proceedings upon which its issuance was based admissible in evidence to impeach it. This rule is, of course, subject to the qualifications that where there is a variance between the calls of the patent for courses and distance and the monuments specified therein, the monuments control, where the monuments are clearly ascertained."

Since the land office has no jurisdiction after issuance of patent, in the event of a controversy the case must be passed upon by the courts. The land department has no power to summon witnesses, take testimony or to perform any of the other functions for which courts are constituted, and therefore it has no jurisdiction. Wherever a conflict arises over this new order of the land office, the courts will determine what land was transferred by the Government to the patentee by taking testimony as to the monuments on the ground. If it be found that the bearings and distances from certain mineral claim corners to lines of the land survey do not conform to the calls in the patent, then those bearings and distances should be ignored, and the monuments outlining the location will define the position of the claim in question. The whole matter only emphasizes the necessity for care when staking a mineral location—to carefully set each post or monument, and to refer these posts or monuments to natural and indestructible objects as far as possible. Trees are very often used for this purpose; but in time a tree, being destructible, may disappear or its identity be lost. Prominent rock outcrops are preferable, and where the lines of the land survey are accessible, they also should be used as reference.

*Sec. 778, second edition, page 1389.

THE Montana State Legislature has passed at the extra session called by Governor Toole, the so-called Fair Trial Bill, the chief provisions of which are that no judge may try a case when either party to the suit files an affidavit that he has reason to believe that he cannot have a fair and impartial hearing before such judge by reason of bias or prejudice of such judge. It permits a judge from another district to sit and try any case, and no more than two judges from the district other than the one in which the action is pending may be disqualified to sit upon such case. The bill was aimed at the Heintze interests, he having won in most of the cases which have heretofore been tried at Butte. What effect this new legislation may have on the litigation between Heintze and the Amalgamated Copper Company remains to be seen. The new law is calculated to secure fair treatment for both sides of any controversy.

Geology in Mining.

That a knowledge of geology in practical mining is not only beneficial, but positively necessary, has been oft times proved. Millions of dollars have been fruitlessly expended in a search for valuable minerals where none existed, and where a knowledge of geology would have saved the unnecessary expense of the work of development. There are many instances where expensive shafts have been sunk in search of a certain ore-bearing horizon, when the collar of the shaft was below that horizon, with no possible hope for encountering it, while in altitude above the sea the platform at the mouth of the shaft was considerably higher than the ore-bearing zone in the same district. This peculiar fact was due to faulting of the strata, resulting in lower beds being raised to a higher elevation than later strata of the same series. The saying "once mineral-bearing, always mineral-bearing," is a good one from a geological standpoint, but not always so when viewed commercially. If a certain area of Archæan rocks is found to be mineral-bearing, it usually follows that any later rocks in the same area, overlying the older crystalline rocks, are also mineral-bearing; but this is not to be assumed as indicating that the entire concession of later rocks laid down upon the submerged Archæan will prove profitable, for such rarely, if ever, proves to be the case. An exemplification of this theory is found in the Black Hills of South Dakota, where the Archæan or Algonkian rocks are notably mineral-bearing, and the overlying sandstones (quartzites), shales and limestones of the Silurian and Carboniferous formations are also ore-bearing in part. Each stratum is not ore-bearing, but there are several horizons already proven to carry gold and silver, and sometimes lead ores in commercial quantities, and in some of the districts of that region there are no less than five separate ore-bearing horizons, while the whole number of strata or separate horizons in which minerals are found in the Black Hills in commercially valuable quantities is not less than nine, and there may be others, as yet undetermined, and this does not take into consideration the occurrence of ore deposits in the massive eruptive rocks of the region. A somewhat analogous condition is found at Leadville, Colo., and in other mineral regions in which sedimentary beds predominate.

Deep wells have been sunk for water and oil in crystalline rocks where a novice in the science of geology could have predicted failure with assurance. Instances are not few where considerable work has been done on strata of black, lustrous, slaty rock, in the belief that it was anthracite coal; beds of obsidian have also been located as coal, and black basaltic rocks have been believed to be tin ore. These are but a few of the numerous mistakes made by those unfamiliar with the simplest principles of geology and mineralogy.

The Labor Situation.

The labor troubles in Colorado and Utah continue to attract the attention of the Governors of those States. Troops have been sent into the Sunnyside coal region of Utah, and the indications are that the State militia of Colorado will have to be sent into the Trinidad district. There are still 500 troops at Cripple Creek, which district has been placed under martial law, and a considerable number at Telluride, though no new disturbances are reported from either of those sections. The Colorado coal strike remains practically unchanged. In California, in Tuolumne county, the Black Oak M. Co. are unwatering their property after an idleness of several weeks, due to the demand of union men who were not employed at the mine that Chinese ore sorters be discharged. No opposition to the reopening of the mine has yet been reported. In Calaveras county it is reported that a large number of striking miners from the Royal Consolidated mines at Hodson are at the village of Miltou, the terminus of the railroad, where they ambushed a party of non-union miners and commanded them to leave the country, which mandate the latter obeyed without argument.

In British Columbia the Provincial Court has imposed fines aggregating $2000 upon James Dunsmuir, being the result of seventy-five cases tried for the employment of Chinese in the coal mines of Vancouver Island. The cases will be appealed.

CONCENTRATES.

"FELDENITE," as an ore, mineral or rock, is unknown to "Concentrates." Possibly the name may have been misspelled.

✤✤✤✤

HUBNERITE is a tungstate of manganese, similar to wolframite, except that it contains no iron. Hubnerite contains 20% to 25% MnO; is usually in bladed forms; color brownish red to hair-brown to nearly black; streak yellowish brown, greenish gray; often translucent. Wolframite contains 9.5% to 18.9% FeO, and 4.7% to 14.0% MnO.

✤✤✤✤

BLACK OXIDE OF MANGANESE, though frequently accompanying veins and deposits of silver ore, is not an indication of the presence of silver in ores containing the manganese. There are many manganese deposits with barely a trace of silver. In some silver mines the manganese is barren, and with its accompanying minerals constitutes the gangue of the vein.

✤✤✤✤

CONCENTRATING MACHINES as arresters of amalgam escaping from plates prove the ability of that class of machinery to accomplish the work for which they are designed—the separation of particles of high specific gravity from those of relatively low gravity—but the amalgam should not be allowed to leave the plates. This is the cause of much loss in gold mills.

✤✤✤✤

WHEN a large amount of sand accompanies the water flowing into a flume, a great amount of it may be eliminated by constructing a box beneath the flume, into which the sand will settle, and from which it may be removed, daily or as often as necessary. To accomplish this a side flume can be built through which the water flows while the sand box is being cleaned.

✤✤✤✤

ALL copper deposits do not have heavy iron gossan, though such characteristic is not unusual. In many large copper deposits little or no copper appeared in the surface croppings, and in some instances now noted copper mines were originally worked for gold or silver. Among these are the copper mines of Butte, Mont., the United Verde of Arizona and the Mountain copper mine of California.

✤✤✤✤

REPLYING to inquiry from Reef, Cochise county, Ariz.: The change in the statement makes no difference. The time of location of a mining claim is a matter of fact, and an error in the date or an intentional misstatement on the location notice does not take precedence over the time when the claim was actually located. If this can be proven then the disagreement of the notice with the fact is not a material consideration.

✤✤✤✤

SULPHURETS containing gold are successfully treated by the cyanide process by fine grinding of the sulphides, and then treating with cyanide by agitation, the solutions being decanted, the remaining sludge being retreated with weak solution and reagitated, the solution being decanted as before. Coarse sulphides do not yield their gold readily to cyanide solutions, even after a contact extending over a period of several months.

✤✤✤✤

SOAP is a poor dressing for belts. It may answer for a short time, but will ultimately damage them. Rosin is little better than soap. These substances harden belts and make them brittle. The coefficient of friction between a belt and pulley may be increased by covering the pulley with leather. Experiments with leather covered pulleys has shown that the coefficient for leather belts over leather covered pulleys is much greater than leather belts over cast iron pulleys.

✤✤✤✤

THE static pressure on the gate of a pipe line 12 inches in diameter, under 400 feet head, would be 19,679.40 pounds, or nearly ten tons. The pressure is 174 pounds per square inch, and this pressure is exerted equally in every direction, upon the pipe as well as upon the gate. The weight of water in a pipe line may greatly exceed the pressure at lowest point in the line, as the vertical height of the column of water in the pipe determines the pressure. A pipe line upon which the vertical pressure at its lowest point is 400 feet may be a mile or more in length.

✤✤✤✤

WHERE the dropping of water down the timbers of a vertical shaft becomes troublesome, it may be diverted by tacking small laths along the inner upper edge of the plates, the laths projecting ½ inch above the top of the plate. This causes the water to collect on top of each plate, which will preserve them, while the surplus water will run down on the side nearest the walls of the shaft. By providing this simple arrangement a wet and disagreeable shaft may be made comparatively dry. The water may be caught up at desired levels and run to tanks to be pumped or raised by skips to the surface.

✤✤✤✤

THE terms "dry" ore and "wet" ore are to indicate the character of a particular ore. A "wet" ore is one containing sufficient lead or copper to make it a desirable smelting ore. A "dry" ore is one which is better suited to milling. It is a commercial designation purely, and depends largely upon environment. An ore which in one district would be smelted in another would perhaps be milled for the reason that to smelt it would require a greater expense than to mill it, owing possibly to absence of flux, such as limestone, iron ore, etc. A typical wet ore is one containing practically all the elements to render its treatment by smelting both a technical and commercial success. In large custom smelters the "wet" ores are mixed with purely "dry" ores and the mixed charge smelted, but this does not entitle the "dry" ore to be classed as a wet ore. Owing to improvement in blast furnace practice, and in the furnaces themselves, some "dry" ores of several years ago have become the "wet" ores of to-day.

✤✤✤✤

WITH the knowledge which comes with years of experience and experiment there should not be any great trouble in treating gold-bearing ores. An ore which after amalgamation, concentration and cyanide treatment still contains appreciable values must either have been improperly treated, or is not amenable to the ordinary milling process as outlined. To secure high extraction by amalgamation and cyaniding, fine crushing is generally necessary, but fine crushing renders concentration more difficult. The economic problem is more important than securing high extraction, for the latter may entail a cost greater than the amount extracted.

✤✤✤✤

IN some instances blue prints which have been overexposed may be restored to normal condition by immersion in weak solution of ammonia—two teaspoonfuls of ammonia to a half pint of water. When immersed in the bath the print will turn purple and gradually become lighter, passing through various shades of violet to pink, and will eventually become white if not removed from the bath. When the color has reached the pink stage the print should be rinsed in water and dipped in a bath of water one-half pint and muriatic acid one teaspoonful. This causes the blue color to reappear. The print should be washed in several changes of clean water before drying.

✤✤✤✤

THE statistics of the production of garnet in the United States have been gathered since 1894. These statistics show a great deal of variation in the quality of the mineral from various localities and consequently a variation in price, ranging from $20 to $60 per ton when the mineral has been concentrated and prepared for market. Since the introduction of carborundum, the artificial abrasive manufactured at Niagara Falls, the demand for garnet and other natural abrasives has fallen off. In 1900 the production of garnet was reported to have been 3185 tons, valued at $123,475, and 4444 tons in 1901, valued at $158,000. This fell in 1902 to 3350 tons, valued at $132,829.

✤✤✤✤

AN electric accumulator is a storage device which is capable of storing electrical energy and discharging it when required. When an electric cell is coupled to an outside source of pressure, so as to send a current through it, it is said to be in the process of charging. On cutting off the current the evolution of gas ceases, and if the poles of the cell be connected by a wire a current is obtained, the direction of which is opposite to that of the charging current, and the cell is referred to a discharging. At pleasure it may again be charged by recoupling to the outside pressure supply. An apparatus employed in this way is called an accumulator. This is the underlying principle of the so-called storage battery.

✤✤✤✤

THE specimens of rock from Tonopah, Nev., are: No. 1, blue limestone; No. 2, limestone with iron oxide; No. 3, quartz breccia, cemented by iron oxide and earthy minerals. The metallic mineral in No. 3 is lead sulphide (galena). It is a portion of what was probably at one time a solid vein of quartz, which has been fractured by the pressure and movement of the walls of the vein or deposit. It is impossible to tell the age of the limestones in the absence of fossils. No. 1 resembles somewhat the blue limestone of Leadville, Colo., but is rather lighter in color than the latter. The Leadville limestone is also generally coarser in grain than the rock from Tonopah. Either of the limestones represented by the samples might become ore bearing under proper geological conditions.

✤✤✤✤

THE ball stamp is a stamp lifted and forced down by steam pressure, the stem of the stamp passing upward through a steam cylinder, and having a piston attached. These stamps are in use chiefly at the Lake Superior copper mines. Each stamp head has a separate mortar. There are separate types of this kind of stamp, all operated on essentially similar principles. The foundations for these stamps are made of concrete or timber and concrete combined and the foundation rests on concrete or on solid bedrock. These stamps crush from 300 to 600 tons of copper rock per twenty-four hours, depending on the size of screen and amount of water used in mortar. The screens vary from $\frac{3}{16}$ round punched to $\frac{3}{8}$x$\frac{3}{8}$ slot. The rapidity of drop and size of steam cylinder, as well as steam pressure, has a direct effect on capacity of stamps.

✤✤✤✤

NO satisfactory microscopic study of rocks can be made without the employment of a microscope especially designed for this kind of work. It has two nicol prisms, one between the eye and object glasses, the second beneath the stage of the instrument. This stage should be adjustable to variable position by means of racks and pinions, and is known as a "mechanical stage." The stage must also be arranged to revolve. There are numerous other accessory attachments to the petrographical microscope, all of which are useful or necessary in the determination of rocks and minerals by a study of their thin sections. This study involves a considerable knowledge of the theory of light, the crystallographic structure of minerals, their refractive and absorbent properties as related to light, etc. It is an intricate study in which only those who make it a specialty may hope to succeed.

✤✤✤✤

THE issuance of the receipt of the receiver of the land office for money received for land for which patent has been applied for is equivalent to patent, and necessity to perform annual labor ceases at once. If the receiver's certificate issues on Dec. 31, and the assessment has not been performed for that year, but $500 worth of work had previously been done, there is no necessity for further assessment work. The law requires that the receiver of the land office issue a receipt immediately upon accepting the money in payment for patent. Upon the filing of an adverse claim it is the duty of the register of the land office where the patent proceedings are pending to notify both parties of the fact, and pending decision all patent proceedings are suspended and assessment work must be done as though no patent had been applied for. Applications to make entry for patent cannot be made at any place than the proper land office and within the proper hours—between 9 A. M. and 4 P. M.

✤✤✤✤

"CARBONATE ORE" is a term employed usually to denote "lead carbonate," although there are numerous other carbonate ores, such as malachite (green copper carbonate), azurite (blue copper carbonate), smithsonite (zinc carbonate). This latter is often called "dry bone" by the miners. There is no carbonate of silver in nature. "Siderite" is carbonate of iron. The name "carbonate" became popular upon the discovery of the large lead carbonate deposits at Leadville, Colo. In that district the several ores were called carbonate, sand carbonate and hard carbonate, also liver-colored rock, the latter a dark-colored iron oxide, usually siliceous, with patches and streaks of lead carbonate and often considerable visible horn silver (silver chloride). The common carbonate was a firm, though not hard ore, consisting largely of grayish lead carbonate, often stained in spots by red and brown iron oxides. Sand carbonate contained a large percentage of lead carbonate, which was found in the form of loose grains, like sand. Often this ore, when broken into, would cause "runs" of ore, sometimes difficult to timber. The hard carbonate was lead carbonate mixed with silica and brown iron ore (limonite).

✤✤✤✤

WHERE a valid existing mining claim is included in a townsite, the owner of the mining location can not be deprived of any of his rights by those who settle upon his claim for the purpose of forming a town. Concerning this the Supreme Court of the United States has declared: "To such claims, though within the limits of what may be termed the site of the settlement or new town, the miner acquires as good a right as though his discovery was in a wilderness." Where the mineral character of land is known, the taking out of a townsite patent by the proper persons for the benefit of those living within the townsite, does not deprive mineral locators of their rights to take up and to work mineral claims within the townsite. In the case of Deffebach vs. Hawke, 115 U. S., 392, 405, 6 Sup. Ct. Rep., 95, the Supreme Court of the United States said: "In the present case there is no dispute as to the mineral character of the land claimed by plaintiff. It is upon the alleged prior occupation of it for trade and business, the same being within the settlement or townsite of Deadwood, that defendant relies, as giving him a better right to the property. But the title to the land being in the United States, its occupancy for trade or business did not, and could not, initiate any right to it, the same being mineral land, nor delay proceedings for the acquisition of title under the laws providing for the sale of lands of that character."

✤✤✤✤

BY "rawhiding" ore in British Columbia is meant the method employed in transporting ore in the winter time from the mines to the railroad or other point. The mountains are generally steep and covered to a depth of several feet with snow. The ore is sacked at the mine and a trail made along the mountain side leading from the mine to the shipping point. A large rawhide is selected and through the thick, tough portion of the neck two holes are made and into these are secured the traces or chains from the "singletree." The sacks of ore are placed upon the hide and a lasso or rope is laced back and forth through holes cut at intervals in the flanks of the hide. These are drawn up as tightly as possible, enclosing the sacks of ore, the number varying from twelve to twenty each weighing 100 pounds or over, according to the character of the ore. On a good trail from 1800 to 2000 pounds can be easily hauled by a single horse. In many steep places on the trail the horse has to hold back the load of ore, and the process is often dangerous. The transportation of ore by this method is inexpensive as it requires only a narrow trail which may be built on grades not permissible on a wagon road. There are usually several horses, each with his pack of ore, forming a train, sometimes several hundred yards long. One driver can care for three or four horses.

Transmission of Power by Ropes.

Written for the MINING AND SCIENTIFIC PRESS.

Running ropes, made of various kinds of material, have been used as a means for transmitting power for many years. There are two systems in general use—one wherein several ropes, each independent of the others, pass over two wheels, having a series of parallel grooves, a separate rope for each groove. This is known as the English system. The other is by means of au endless rope which passes several times over each of two-grooved wheels, the ends being carried over a third wheel, situated either betweeu the main pulleys or behind one of them. This third wheel is of the sheave type, having a single groove. It is usually affixed to a traveling carriage, and being adjustable is employed as a tightener. The tightener may be "fixed" after adjustment, or it may be made to operate automatically by means of a counter weight, which, while constantly holding the ropes tight, admits of a certain amount of flexibility.

The principal factors which favor rope transmission are a lower first cost, and lower cost of maintenance, provided the installation is properly made; the greater distance over which power may be trausmitted. The amount of power that may thus be transmitted is only limited by the amount of power primarily available. Generally a rope drive ruus more smoothly than auy other, owing to the greater flexibility of the rope, and consequent adaptability to varying load. They are also practically noiseless, which is presumed to be due to a great extent to the cushion of air in the bottom of the grooves, beneath the rope. One valuable feature of rope drives not obtaining with any other system of transmission of power, except electricity, lies in the fact that power may be transmitted at auy augle by the proper arrangement of the "third wheel," or tension sheave. The life of a good rope when employed under proper conditions as to construction and use is stated to be from three to six years, and in a few instances longer. The factors which make driving ropes short lived are: Defective design of construction; improperly turned grooves in the pulleys; too great a strain upon the rope; unsuitable size of sheaves; too small a rope for the amount of power required and running at too high a speed.

As between the two systems, English and American, the former is not adapted to vertical drives, nor in any place where the distance between the pulleys is not sufficiently great to cause the weight of the rope to form its own tension. This system cannot be operated to advantage where the inclinatiou of the rope between the pulleys exceeds 55° to 60° from the horizon. It is stated that a 2-inch rope running 2500 feet per minute will transmit by the Euglish system of individual ropes about 33 H. P. This was increased to about 50 H. P. when the speed of the rope was increased to 5500 feet per minute, but when run at 7500 feet per minute or over the amount of power transmitted did not exceed that transmitted at a speed of 2500 feet per minute. This is due to the fact that when in motion the tendency of each atom of a running rope is to move in a straight line. Any giveu point ou a running rope, when it reaches the sheave, has a tendency to continue to move in a directiou tangent to the circumference of the wheel. At high speed this teudency is greatly increased until the rope ceases to cling tightly to the grooves, and slips somewhat on the pulleys with a consequent great loss in its ability to transmit power.

The American system of single rope with tension sheave is adaptable to any angle, and a given amount of power may be transmitted with a smaller rope than by the multiple rope system employing the same number of grooves. The tension carriage always adjusts itself to the power and speed, and by this system a higher rate of speed may be employed without the loss of power incident to the English system running at the same speed.

When deciding upou the question of small vs. large ropes, the preference should go to large ropes with larger sheaves, rather than to a greater number of grooves on smaller sheaves with smaller ropes. The first cost of large sheaves will be greater, but eventually the economy of larger ropes aud larger sheaves will be demonstrated. Too great a weight ou the tension carriage is not advisable, for while it increases the adhesion of the rope, with a consequent higher percentage of power transmitted, the rope uuder these couditions will be comparatively short lived. Ropes must not be run either too tight nor too slack. With changes in the humidity of the atmosphere the rope will stretch or shrink. On damp days the ropes will shorten and create abnormal friction, ofteu causiug heated bearings, while during dry weather the ropes will stretch to such an extent that under high speed they are likely to leave the grooves. These conditions apply particularly to the multiple rope system, the single rope American system being always adjusted automatically by the tighteuer.

In the designing of rope drives there are numerous coufliciting factors. The manufacturing concern bidding for the work may lesseu the number of grooves and the size of sheaves to an extent rendering the factor for safety a very small one in order to be able to quote a low price. By a formula they can demonstrate that with a given size of rope, diameter of sheaves and speed of driving a stated amount of horse power may be transmitted. The rope manufacturer, from his standpoint, figures the conditions given by an entirely different, but also accepted, formula, aud arrives at a much lower result. He knows that small sheaves and few turns about them with high speed means short lived ropes, and his chances for selling a second rope to the same person under these improper conditions are slender. The aim should be in estimating transmission of power by ropes, not the greatest possible amount of power a rope may be made to transmit, but to ascertain the highest economy that is possible to derive from its use.

There are numerous formulæ for estimating power transmitted by ropes, but owing to the difficulty in arriving at some of them there is usually more or less variation in the calculations made ou any particular installation. The most important factor is the

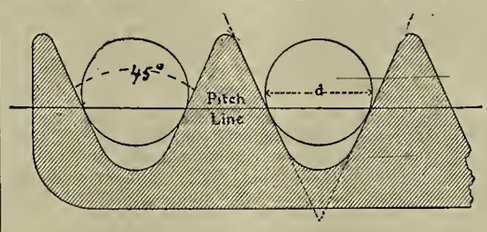

FIG. 1.

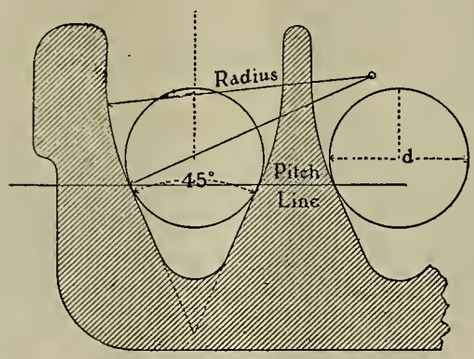

FIG. 2.

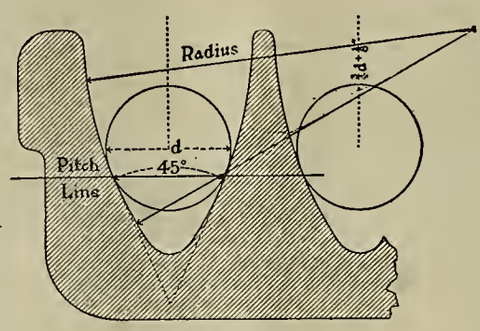

FIG. 3.

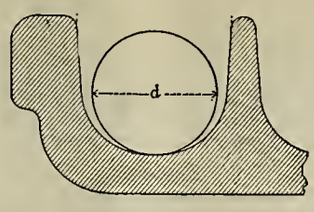

FIG. 4.

working tension which the rope must sustain. This is usually estimated at 200 pounds for a rope 1 inch in diameter. The following table is from Kent's Mechanical Engineers' Pocket Book:

Diameter of Ropes.	SPEED OF ROPE IN FEET PER MINUTE.											Smallest Diameter of Pulley in Inches.
	1500	2000	2500	3000	3500	4000	4500	5000	6000	7000	8000	
½	1.45	1.9	2.3	2.7	3.0	3.2	3.4	3.4	3.1	2.2	0	20
5/8	2.3	3.2	3.6	4.2	4.6	5.0	5.3	5.3	4.9	3.4	0	24
¾	3 3	4.3	5.2	5.8	6.7	7.2	7.7	7.7	7.1	4.9	0	30
⅞	4.5	5.7	7.0	8.2	9.1	9.8	10.8	10.8	9.3	6.9	0	36
1	5.8	7.7	9.2	10.7	11.9	12.8	13.6	13.7	12.5	8.8	0	42
1¼	9.2	12.1	14.3	16.8	18.6	20.0	21.2	21.4	19.5	13.8	0	54
1½	13.1	17.4	20.7	23.1	26.8	28.8	30.6	30.8	28.2	19.8	0	60
1¾	18.0	23.7	28.2	32.8	36.4	39.2	41 5	41.8	37 4	27.6	0	72
2	23.2	30.8	36.8	42.8	47.6	51.2	54.4	54.8	50.0	35.2	0	84

In the case of temporary installation the work may be largely increased—to nearly double that given in the table.

Another factor in the transmission of power by ropes is the sag of the rope between the pulleys.

The wear on the rope is the same whether the distance between the pulleys be great or small. Where both the driving and driven pulley are the same size the grooves should have the same angle of pitch, but where one pulley is smaller, that pulley should have 45° grooves and the larger pulley may have a 60° angle.

The following table, also from Kent, gives the diameter of pulleys and weight of rope best suited to accomplish given results:

DIAMETER OF PULLEYS AND WEIGHT OF ROPE.

Diameter of rope in inches.	Smallest diameter of pulley in inches.	Length of rope to allow for splicing in feet.	Approximate weight in pounds per foot of rope.
½	20	6	.12
5/8	24	6	.18
¾	30	7	.24
⅞	36	8	.32
1	42	9	.49
1¼	54	10	.60
1½	60	12	.83
1¾	72	13	1.10
2	84	14	1.40

With a given velocity of the driving rope, the weight of the rope required for transmitting a given horse power is the same, no matter what size of rope is adopted. The smaller rope will require more parts, but the weight will be the same.

The size and shape of grooves is important. In the early history of rope driving many different kinds of grooves were tried as an experiment, and of these there are two forms of recognized merit, the "V" shaped groove with straight sides and the "V" shaped groove with curved sides. Besides these there are other forms slightly modified from them. The "U" shaped groove is used for idler pulleys and sometimes for the multiple rope system. The relation of groove to size of rope must be such that the rope shall never touch the bottom of the groove. Eugineers differ somewhat as to the best angle to give grooves, both 45° and 60° having their adherents, but 45° is generally recognized as giving satisfactory results.

The accompanying sketches show four forms of grooves. Fig. 1 shows the straight "V" shaped groove. Fig. 2 the "V" groove with curved upper portion and straight lower portion. Fig. 3 shows the "V" groove curving from top to bottom of the groove. Fig. 4 shows the "U" shaped groove used in the idle pulleys.

Sinking a Steel-Lined Shaft in South Africa.

In the course of his paper, presented to a recent meeting of the South African Association of Engineers, says the Johannesburg Star, E. Williams said he was consulted as to the best method of sinking a shaft on the property of the Free State Colliery Co., Ltd., on the Taaibosch Spruit, near Viljoen's Drift, in the Orange River Colony. Several attempts had been made to sink shafts through the sand which covered practically the whole of the farm, but owing to the volume of water met with every effort had been unsuccessful, and it was found impossible to get down by ordinary means. Wooden caissous were tried, but proved unsuitable owing to the masses of clay occurring in the sand. It was difficult and costly to get a plant suitable. The cheapest and quickest method appeared to be to sink steel cylinders, and this was adopted. T. Begbie & Co. undertook the construction. The cutting edge on the first or bottom section was machined before the plates were bent to sweep, and the construction of the sections was as simple as possible. A simple flanged joint with an ordinary gasket wrapped with tarred flannel was adopted, and ½-inch bolts and 8-inch ceuters were used. The chief difficulty anticipated was the layers and masses of clay occurring in the sand, which would certainly impede the travel of the cylinders, and owing to the irregular occurreuce of the clay it was realized that special provision had to be made to ensure the cylinder going down vertically. To guard against any difficulty in that respect a strong frame was erected over the shaft. The sections were brought under the frame, and bolted to the top already in position. Then the runners were suspended by turn buckles, with long screws, to the top of the frame. Following this the hydraulic jacks were started, the thrust being taken by the weighted top beams, and the weight of about 150 tons of old rails, was found sufficient to take the pressure necessary for forcing down the cylinder. Often a small segment of the cutting edge would meet the clay, and then the jack immediately above got more pressure than others. The pumping of water and winding of sand would soon liberate the clay, and then that side of the cylinder was liable to run ahead. This was guarded against by keepiug the hanging screws just on the slack when the jacks were exerting pressure. It took about sixteeu weeks to sink the cylinder and complete the work to the shale bed. When that was reached the cylinder was pressed into the shale by the full weight of the loading. The shaft was kept fairly clear of water, and then boys picked a chase in the shale to allow the cylinder to

travel. This was continued for a distance of 36 inches, when a tarred flannel bed was made, and the cylinder pressed hard on it. The work was carried on by the manager, W. Blake, in an expeditious manner, and he had many difficulties to overcome in this bit of pioneer mining.

In Clear Creek County, Colorado.

The East Argentine district of Clear Creek county, Colo., is one of the most interesting in that State. In this district the Vidler tunnel is projected to cut through the range of mountains beneath Argentine pass, which is at an altitude of 13,000 feet above the sea. The accompanying illustration is that of McClelland mountain, which well illustrates the rugged topography of the country in that district. The canyon is known as Leavenworth gulch. The Colorado Central mine, which has a record of $10,000,000, appears in the central portion of the engraving. Clear Creek county is one of the first producers of the State, the first placer mine located in Colorado having been taken up in that county. The geological formation of the county is described as consisting principally of granite, gneiss and schist, traversed by eruptive dikes of various kinds. The veins are mostly clean cut fissures, with definite walls, and seem for most part to have been formed subsequent to the intrusion of the dikes, often being found in contact with a dike. Although the veins are generally clearly defined, pay ore is often found in the wall rocks adjacent to the veins in the form of local shoots, due to impregnation of the wall rock with gold and silver-bearing base metal sulphides. The vein material itself is altered country rock, which has been fractured and ground up between the moving planes of the walls, the mineral solutions subsequently depositing the sulphides with the gold and silver in the interstitial spaces, besides depositing large quantities of quartz and other minerals by replacement of the pulverized country rock of the vein.

McClelland Mountain, East Argentine District, Clear Creek County, Colorado.

Glassy volcanic rocks like obsidian, vitrophyre, pearlite and pumice are not gold bearing, as far as known. Gold is found in a great number of igneous rocks, but has never been recognized as an original constituent of such rocks. It is generally believed that the gold found in igneous rocks has been deposited from waters carrying gold in solution.

The Needs of the Miner.

To the Editor:—In your issue of Nov. 28th you note the fact that bills are pending in Congress to establish "mining experiment stations," etc. You say: "While the idea of experiment stations is one worthy of consideration and may prove of decided benefit to the mining industry, the plan outlined in the bill is clearly an invasion of the field now occupied by the numerous assayers and chemists throughout the country, and would result in driving some of them out of their profession."

What you say is true to a certain extent, but our Government is for the greatest good to the greatest number, and not for the benefit of the few. Apply your reasoning to the fish hatcheries and farming experiment stations. Could not private individuals carry on these enterprises, and with profit to themselves? Look at the distinction made between the farmer and miner in getting Government land. The Government, at its own expense, surveys the land for the homesteader, and gives him 160 acres of land for the sum of $26.50, local land office fees. Then the Government spends millions each year to find out the cure for chicken pip, hog cholera, mouth and foot disease of cattle and horses, selecting and experimenting with seeds for the farmer, sheep scab, etc., all of which goes to the farmer for asking. Millions are spent in improving the rivers and harbors so that the farm products may reach the markets cheaply. How does the miner fare? He has to go to the wilds, delve in the mountains and hillsides. If he finds indications of mineral, he has to, at his own expense, stake out and set up his boundary lines and corners. For $26.50 and five years' residence the farmer secures 160 acres. The miner himself has to work out, or hire it done, $500 for from 10 to 20 acres, according to the law of the State in which he is, to get a right to apply for a patent for his claim. During this time he has, perhaps, paid out to an incompetent assayer (?) from $50 to $100, and then does not know for a certainty whether he has correct assays or not. I know of a case where a miner spent four years on a claim that he thought was a copper mine. He had for four years been getting assays showing 11% to 12% copper. At last he met a man who was a first class chemist and assayer. He had him make some assays, and he got one-twelfth of 1% copper. The miner could not believe him. He then took five samples of the pulp and sent them to five leading assayers in the United States, and the returns from each and every one of them showed one-twelfth of 1%. The miner then said: "I wish I had met you sooner. I have put in four years' work on this claim, have spent over $100 for assays, and now I find out that the assayer (?) was giving me false assays." Had there been such plants as the bills in Congress call for, for a small sum this miner would have found out at once that he had no copper mine. Again, there was a man running a team who took up a claim. He found rock that carried gold. He took samples from time to time to an assayer (?), who reported $44 to $46 per ton. He sold his team, hired men to get out a carload of ore for the smelter. When the ore arrived the smelter found that it ran about $4.50 per ton and called on him to pay smelter charges before they would treat it. The miner, having lost his all, went insane and was taken to the insane asylum, and there he died. The assayer who gave the big assays is strongly opposed to these bills in Congress, as it will put him out of business. It was from a knowledge of these facts that I prepared the bill now under discussion. Then, again, the rocks here and elsewhere contain by-products that are worth as much or more than gold or silver. Ordinarily the assayers that are scattered throughout mining districts can only assay for gold and silver. With these stations established, a miner would know all the minerals in his ore, gravel or cement. It was for this purpose, and with no thought of private assayers, that the bill was prepared.

I will now go back to the miner after he has done his assessment work and is ready to apply for patent. He has to look up a deputy United States mineral surveyor and make a contract with him to do the surveying. He then has to send $30 to the Surveyor-General. He gets his order for survey, and has the survey made at a cost of from $75 to $150. Then, he is out from $10 to $30 getting his abstract, certified copy of certificate—one certificate from the United States court and one from the State court—that no suits are pending; then $10 to the railroad for their fees; then from $35 to $50 for advertising, and finally $5 per acre and the same for the thousandth part of an acre. Then add attorney's fee of from $40 to $75, and there you are. Say his claim is 20 acres—the limit—and with his preliminary and assessment work he is out at least $550. Add the minimum charges above, and he is out $800, or $40

per acre if it is a 20-acre claim, and $80 per acre if it is a 10-acre claim. How does this compare with the farmer's 160-acre claim for $26.50, and who gets a profit each year from his farm? The miner gets no income in the time he is working—his is all outgo.

I make this statement to you because your paper, I think, does more for the miner than any paper I know of. The information in each of your issues is worth far more than the price of the paper per annum. Seeing that you take such an interest in the miners is my apology for writing this to you, so that you may know the cause for the bill now in Congress.

Trusting that you will receive this in the same spirit that actuates the writer in writing to you, I submit the same for your candid consideration.

Deadwood, S. D., Dec. 4. JAS. A. GEORGE.

Notes on Quartz Milling on the Rand.*

NUMBER II—CONCLUDED.

Discussion of paper by FRASER ALEXANDER.

Mr. Wilkes advocates removing the amalgamating tables to the cyanide works and I fully agree with him, though not only for the reasons he gives, that they should be removed from the mill wherever they may be located. In the first place, the mill is essentially a crushing machine, and should be regarded as such only; in the second place, the greatest improvement in amalgamation, an improvement that may have the most astonishing results, will occur when classification of the pulp takes place previous to amalgamation, and when the tables are specially adapted in size, grade and form to deal in the most efficient manner with the varying products produced. I do not propose to go into the details of the advantages of such a scheme on this occasion, but, to give an instance, the excess water that is necessary to obtain a high stamp duty would no longer be a source of danger to amalgamation, and the duty and recovery would be simultaneously increased.

Mr. Durant quotes figures given in a paper of Edward Chester's, where he says that crushing through a 100 mesh screen only 13.7% of the total product remained on a 900 (30 linear) mesh screen. On the East Rand Proprietary Mines we have found that crushing through a 1000 mesh screen with a 2-inch discharge the following results were obtained:

Remained on 40 screen	34.20%
Remained on 60 screen	27.00%
Remained on 90 screen	7.70%
Passed 90 screen	31.10%

These figures do not at all agree with those quoted by Mr. Durant.

In conclusion, I again desire to confirm what has already been stated, that the high values in the residues are the direct result of the mill work. Many experiments after treatment have shown that all the accessible gold has been dissolved and that only a more complete crushing will enable a better recovery to be obtained. I have heard it stated more than once that of the gold the mill loses, only 85%, may be expected to be recovered in the cyanide works, and millmen have been urged in consequence to catch all they can on the plates. This is, I think, misleading, as any gold that is in a state possible to be caught by amalgamated plates is also in a state to be easily and completely dissolved by the cyanide treatment. Naturally, the exception to this is very coarse gold, but since touching our deeper slopes coarse gold seems to have practically disappeared, and, in any case, it is not the material liable to be lost from the mill through careless amalgamation, and I maintain that any such indifferent amalgamation will not affect our residues to anything like the same extent as imperfect crushing. By imperfect crushing I mean the imperfect crushing of the gold-bearing portion of the rock.

Mr. Alexander: In replying to the many admirable contributions sent in criticising my paper published in the Journal, I must say that I am disappointed in not having had a fuller discussion on some of the more vital points, such as inside versus outside amalgamation, fine versus coarse crushing, etc., from men who have tried both.

I agree with Mr. Roskelley's remarks about the construction of a modern mill, tending rather to follow in the ruts of the ancient stamp mill, and I believe our mechanical engineers only require such intelligible explanation of faulty construction as contained in Mr. Roskelley's remarks to speedily remedy this.

Speaking of the relative merits of crushing with a 700 and 1000 screen, I fully agree that more should be crushed through a 700 screen. Strange to say, this theory is not always borne out in actual practice, hence my remarks that the screen alone is by no means a final factor regulating fast crushing.

It is seen from experiments that the ratio of water to ore crushed plays an important part in fast crushing. My recommendation of 6 inch discharge through 1000 screens with six to one water is found in actual practice to yield the most efficient results, the discharge being lowered where coarser screens are used.

The sliming of ore need trouble millmen very little, in fact, it does not cause anything like the annoyance or bad extraction resulting from the bursting of a screen for instance or partially crushed material, so commonly the bugbear in concentrates.

Mr. Roskelley's views re inside amalgamation are doubtless perfectly correct, but how many millmen on these fields persistently follow an antiquated practice simply because it was done twenty years ago, regardless of the waste of both gold and mercury, resulting from this most unreasonable practice of trying to catch gold—(1) at the cost of all accurate record, (2) the loss of at least 50% of the mercury used in the mill, and many other disadvantages.

There is little doubt that the rock breakers are not always made to do their fair share of the preparatory work, and this defect is often traced to the inaccessible position which they occupy in the crusher station.

I am of the opinion that the contamination of gold with mercury tends to encase the gold particles, and certainly does retard extraction by cyanide. That a very considerable quantity of partially amalgamated gold escapes from the battery is sufficiently proved by means of side shaking tables, which catch about 300 ounces of gold from a 30-stamp mill per month. I presume, were it not for these extraordinary tables, this amount would have gone to the treatment tanks, and a recovery of about 30% only obtained, which bad recovery would be debited to the faulty work of the cyanide process, whereas in reality the mill is at fault. It is not too much to say that where inside amalgamation is practiced a loss of mercury equalling 2000 ounces per month will result from 100 stamps if this mercury carries only 2% in gold. By the time it reaches the treatment tanks it would mean 40 ounces, from which only 12 ounces, or 30%, can be recovered at best.

In answer to Mr. Pead's question of duty per stamp through a 1000 mesh screen which I mentioned in my paper, I was not at the time aware that this duty was at all exceptional. My figures were taken from the actual results obtained at the Ferreira Deep, Ltd., over six consecutive months' run. I might mention that special light screens were used which from later experiments appear to account for an increased duty equal to .2 ton per stamp per day over the ordinary light gauge.

I do not think there is any difference in the rock on this mine from that of any other deep level, nor can I define any special system of milling.

In reducing the height of discharge to suit the screen, or vice versa, the specific gravity of the crushed material must play a most important part. As we crush in water, I think it will be easily seen that where the screen is fine the maximum splash would give most beneficial results, the specific gravity allowing the rise of the fine material in water. We can only obtain this heavier splash with sufficient water in the mortar box and 6 inches appears from actual work to meet the case.

Where coarse screening is used it would retard fast crushing, as the heavier particles will not so readily rise to the face of the screen in this large amount of water.

I believe that the present position of the amalgamating tables is wrong.

1. The vibration caused from the constant falling of the stamps is likely to cause the quicksilver gradually to work off the plate.

2. When the plates are being cleaned the stamps must be stopped, causing a delay of thirty minutes per twenty-four hours for each table of five stamps, which means a complete stoppage of the mill for fifteen hours in each month, whereas the pulp might easily be divided over nineteen tables when one is being dressed or scraped.

3. A similar platform to that now used to walk on at the foot of the plates might with considerable advantage be employed close up to the mortar boxes, from which the millmen could easily change screens and generally work their boxes.

4. Amalgamation would become a more scientific process in its relation to the technical requirements of modern gold mining.

*Abstract Jour. Chem., Met. and Min. Soc., S. A.

Iron Mountain, Durango, Mexico.

There is a solid mass of iron ore close to the International railroad depot at Durango, known as Iron mountain, which has been known ever since the Spaniards and the Mexicans from the south first reclaimed this region from savages over 300 years ago. In 1803 Baron Humboldt, who did not reach Durango in his explorations, but who had seen samples from this mass of iron, said of it that it was an "enormous mass of malleable iron and nickel, whose composition is identical with that of the aerolite which fell near Agran in Hungary in 1751. It is asserted that this mass at Durango weighs nearly 1900 myriagrams, or 400 times as much as the aerolite discovered by M. Rubin de Celis in Olumpa, Tucuman." Humboldt evidently thought that this might be the world's greatest aerolite. Geologically, examination shows it to be a dike, emerging from a rocky plain at the elevation of 6300 feet, rising from 400 to 650 feet in height itself and forming a mass of iron ore 1 mile long and one-third of a mile wide. It has been calculated to contain 500,000,000 to 660,000,000 gross tons above the surface, with no notion of what may be below. The ore is a hard specular hematite, carrying on an average 60% of metallic iron, much of it going higher and some even to 67%. It is said to be suitable for practically all processes of iron and steel making.

The Mexican National Iron & Steel Co., an American concern, claims about one-half the mountain, but has never until lately been a paying concern. Charcoal can be obtained near here, made from the timber on the Sierras to the westward, but its production has always been limited and relatively expensive. Coke was formerly brought from the United States and at such prices that the marketing of the company's iron products in Mexico, except at near-by points, was, when the high freight rates were added, very commonly at a loss, or no gain, in competition with American iron products. Mexican coke is now obtained and at considerably lower prices, and facilities are being added for an increased output. The steel plant has not yet been added to the plant.

A New Zinc Field.

That southwestern Wisconsin is likely to have considerable economic importance as a center of the zinc industry is a fact that is not generally realized. It will be news to many to learn that twenty-one concentration mills have been erected in that district in the last two years, and that seventeen of them were in active operation during the last summer. Deposits of lead have long been noted in southwestern Wisconsin, northern Illinois and northeastern Iowa, and some work has been done toward their development, but owing to the discovery of extensive zinc beds below the lead formations, the district has recently become doubly interesting. The ore is not so clean as that found at Joplin, Mo., as it carries a considerable quantity of iron, and for this reason it received at first no particular attention. Improved metallurgical processes have, however, shown that this district contains a large reserve supply of zinc ore. This fact gives especial significance to the co-operative studies of the district that were made during the last summer by the United States Geological Survey and the Wisconsin Geological and Natural History Survey. The first organization was represented by H. F. Bain, and the second by U. S. Grant of the Northwestern University at Evanston, Ill.

The particular feature of the State Survey's work was that of making topographic and geologic maps on a large scale. Years ago, before the discovery of the underlying zinc beds, the State Survey did some geologic work in the district with special reference to the lead deposits. The maps resulting from that survey were drawn on a scale of a half inch to a mile. The field sheets of those made during the last summer were on a scale of 8 inches to a mile, and the printed sheets 4 inches to a mile, thus offering increased opportunity for elaborate detail and finish.

Mr. Bain's special work was the study of the ore deposits of the district. The results of his investigations will probably be published by the United States Geological Survey in a report that will be merely part of a more comprehensive work on the lead and zinc deposits of the Mississippi valley.

Three processes of separating the zinc from the iron ore are at present in use in southwestern Wisconsin. The Mineral Point Works of Mineral Point, Wis., the property of the New Jersey Zinc Co., is one of the few plants in the country where what is known as the "contact process" of manufacturing sulphuric acid is employed. This process minimizes the cost of the acid and allows the use of mixed ore. The fumes were formerly confined in lead-lined rooms, about 20 cubic feet of space being required per pound of sulphur burned per hour. By the new process these chambers are discarded, and other improvements have been made. The result is that the Mineral Point Works are now able to treat a grade of ore that they formerly refused to buy.

The roasting process, which is the second means of separation in use, is one that has lately been widely applied in Colorado. It consists of roasting the ore until the iron becomes magnetic and then picking it out with magnets.

The third process, which was likewise developed in Colorado, is an application of the principles of static electricity to the concentration of ores. The direct effect is the opposite of that produced by the magnets in the roasting process, for the electricity repels the zinc instead of magnetizing the iron, but the process results, in both cases, in the separation of the minerals in the ore. The electrical method is simpler and cheaper. The expense of roasting the ore, which amounts to about $1 per ton, is saved. In addition to the zinc blende, an iron sulphide is also obtained, which is sold to the manufacturers of sulphuric acid, so that the process thus affords a valuable by-product.

The zinc industry in southwestern Wisconsin would seem to have passed the experimental stage. Some of the mines have paid well. The mineralized area extends into northern Illinois and Iowa. In Illinois four or five mines are being developed and a little ore has been sold. In Iowa all the zinc properties are still in the development stage.

Electrically Driven Power Pumps.

The Aldrich horizontal quintuplex pump, built by the Allentown Rolling Mills, is illustrated in the accompanyiug engraving, Fig. 1. By reason of the large number of cylinders it delivers its discharge in a uniform stream at a velocity not exceeding 3 feet per second. The pump has five single-acting plungers operated from one crank shaft, the cranks being set 72° apart angularly. The working load being divided among five plungers, the liability of breaking bottom chambers, gears, cranks, etc., it is claimed, is much less than if the work were done with two or three plungers, and that the working barrels and valve chambers subjected to the working pressure are similar and relatively smaller than would be the ease with fewer cylinders. The motor is set in the center of a massive base, bolted to the bottom housings, and the shafts are extended on each side and back of piuions and outboard bearings. The power is transmitted to the crank shaft by two gear pinions, each of which is said to be stroug enough to do the eutire work. The crank shaft is made from open-hearth cast steel claimed to have a tensile strength of 60,000 pounds per square inch, and of such size as to give a total strength of fifteen times the maximum load. The conneetiug rods are fitted with bronze adjustable bearings at each end, and the length of the rod is four times the length of the stroke, whieh reduces the angularity and consequently the pressure upon the guides below that usually obtained. The main journal box is made in three parts, giving side and top adjustments. The plungers are east on end and ground perfectly straight and eylindrical. The working barrels are separate castings and contain the bronze valve seats whieh are readily aecessible through covers held in position by hinge bolts. The valves are leather faced with a bronze baeking and the water area is said to be sueh as to reduce the veloeity of flow to less than 3 feet per second. In order to make the pump as nearly automatic as possible the housings are cast with an oil case, and this is partly filled with oil, into whieh the conneeting rods dip at eaeh revolution. There is also attaehed a small radial oil pump which forees the oil from the oil case to eaeh of the bearings, whenee it turns back, thus keepiug up a continuous oiling process.

Fig. 2 shows the Aldrich vertieal quiutuplex pump, which is built to a great extent upon the same lines as the horizontal quiutuplex, and is calculated for working lifts from 500 to 1400 feet.

Fig. 3 illustrates the arrangement of the Aldrich triplex pump for operation with two direct-eurrent motors and is said to be especially suitable for eouditions where it is desired to have a variable capacity pump. When the electric eurrent passes through the motors in series the speed and eapacity of the pump will be half its normal flow, while if the eurreut is passed through the motors in parallel they will run at full speed and give its maximum capaeity. The motors ean be supplied with field rheostats, eontroller, switehes, etc., so that it would be possible to pump one-quarter, one-half, three-fourths or full capaeity without reducing the effieieney of the motor. One of the great objections heretofore raised to electrically driven pumps has been that the operator could get but one speed and there would therefore be no surplus of capacity, but this objection is said by the makers to have been overcome in the construction of the pump shown in Fig. 3.

Messrs. Harrou, Rickard & McCone, of San Fraucisco, Cal., represent the Alleutown Rolling Mills on the Pacific coast, aud have during the past six months installed several of them in large pumping plants throughout California. Two 6x12 horizontal quintuplex and one 9x12 vertical triplex are now in operation at the Brunswiek Consolidated mine at Grass Valley. One 9x10 vertical triplex is used by the North Shore Railroad in their works at Sausalito, Cal., and one 4x12 horizontal quintuplex is now ready in the East to be installed at the Oneida mine, near Jaekson, Amador county, Cal.

Messrs. Harron, Riekard & McCone will furnish any information which those iuterested may desire, upon reeeipt of inquiry.

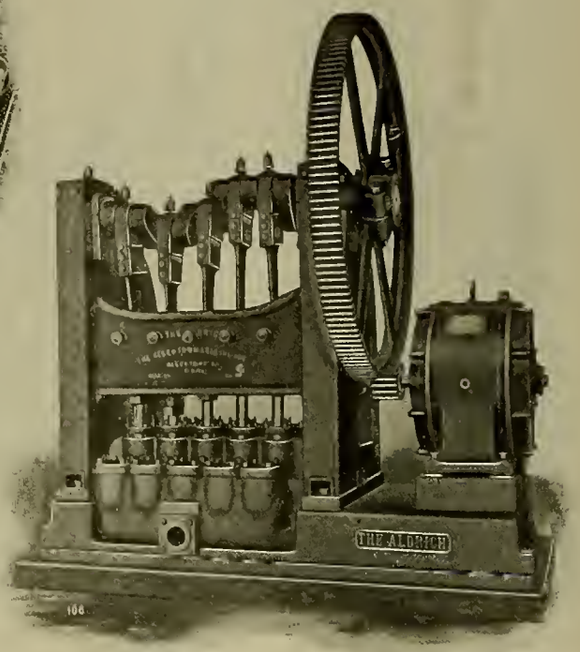

Fig. 3.

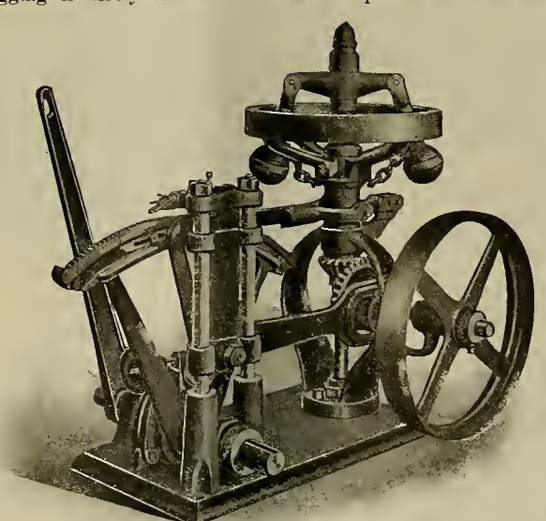
Sectroidal Relay Governor.

The sectroidal governor, mauufactured by the Replogle Governor Works, Akron, Ohio, is designed espeeially for impulse water wheels where the gate rigging is nieely balanced or does not operate too elumsily. It can operate defleeting nozzles, hood uozzles, throttle valves and butterfly gates.

It embraces the relay principle, that is, it works by installmeuts, eutting itself out automatically every time it operates, to prevent hunting or raeing, it being held that water wheel regulation of a reliable eharacter ean be provided by the use of this relay priuciple in the governor. With a wheel and governor given, the regulation or government depends entirely on three conditions.



First—The limits of time that governor may have to move gates. This time is solely determined by the conditions under which the wheel must operate, that is, the pressure and volume of water in the pipe. Changes in flow must not be made too rapidly, or the pipe line will be endangered by the vacuum or the water ram that occurs when the water starts too suddenly or stops too suddeuly. Great care and good judgment must be exercised regarding the time of permitting the governor to open the gates.

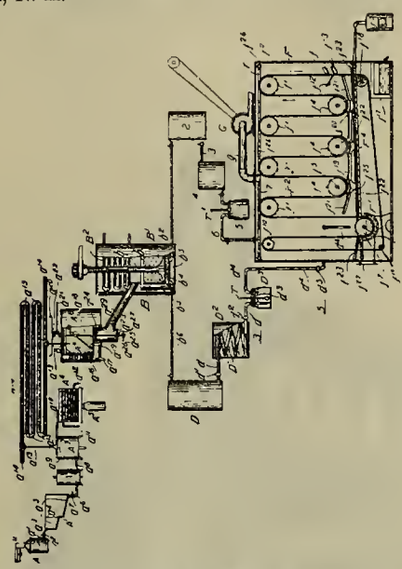
Second—The relative changes iu load are a great factor in governing. It often occurs that the owner of a water wheel wishes to change his power or load faster than he dare ehange the water supply from his pipe. Small ehanges of load, that gravity ean compensate for readily, are not very difficult to govern, but when comparatively large changes must be made in load, theu the third and last of these eouditions must have special attentiou, as it alone makes such goverument possible.

Third—(Momentum or power storage of the revolving maehinery). As it requires power to give motion to the revolving maehinery, it requires additional power to increase its motion, and when the speed is deereased power is given out. The heavier the machinery the more power it will absorb in an iucrease of speed, or give out in a deerease of speed.

The relay works in eonjunction with the momentum or power storage in government. The relay deviee causes the governor to automatieally slow up the maehinery when the load is inereased or the gate opened. There should be suffieient power given out in this slowing proeess to earry the increased load until the effects of the inereased flow of water ean be added to that already at work, eonsequently when greal ehanges of load must be imposed on a water wheel there must often be added sufficient weight of flywheel to store the power neeessary to g overn for such changes in load. The weight in machinery that gives out power in adding a load will absorb power when the load is cut off, until the governor has elosed the gate or shifted the nozzle.

The governor pulley must ruu 120 revolutions when the water wheel runs at its proper speed. Further information will be given by the manufacturers upon erquest.

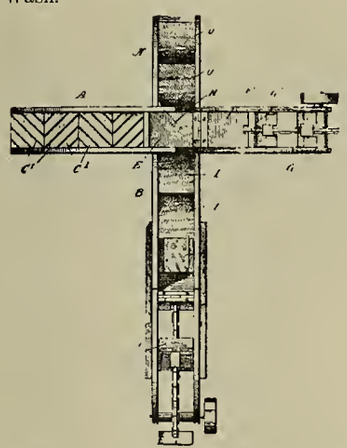
Sectroidal Relay Governor.



Drilling in raises should be less expensive than in shafts or winzes, unless there be too mueh time lost in taking machines up into the raise or lowering it on completion of a round of holes. By eonstrueting a strong platform under the back of the raise, and beneath it arranging a second platform for the drill and other tools when through drilling, mueh time may be saved in handling the maehine. Blocks should also be used in handling timbers if they are too heavy to be handled easily. The saving of time by providing the proper means for handling materials and tools will greatly reduee expenses in mining.

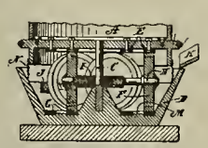
Mining and Metallurgical Patents.

PATENTS ISSUED DECEMBER 1, 1903.



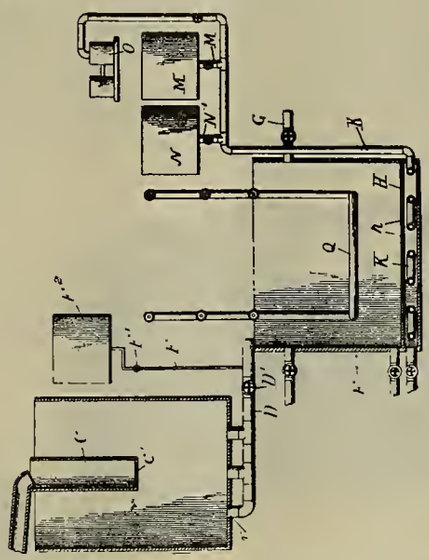
Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

CONCENTRATING APPARATUS.—No. 744,823; G. R. Tucker, Boston, Mass., and G. W. Goddard, Concord, N. H.



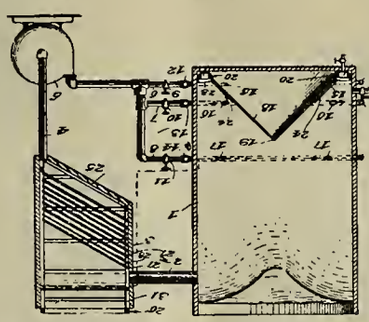
In concentrating apparatus, combination of closed casing, gas inlet port and gas outlet port with receptacle within casing for liquid material to be concentrated; device for continuously removing from receptacle into chamber of casing sheet-like portions of liquid material; means for creating and maintaining a current of gas through casing; means for removiug concentrated material from removing device; meaus for flushing side walls of casing, and means for returning flushing material into receptacle.

GOLD SEPARATOR.—No. 745,949; M. C. Wright, Sultan, Wash.



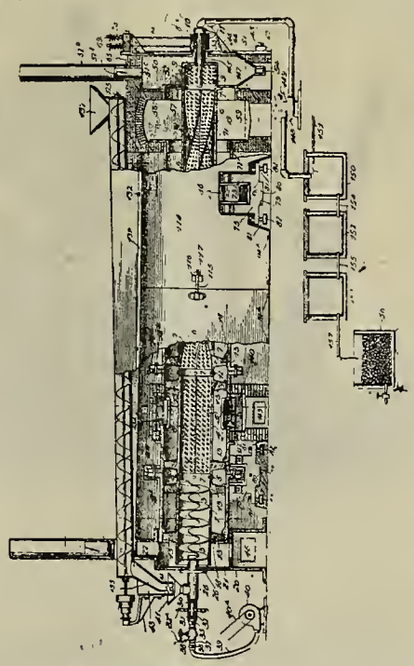
Gold separator, comprising flume for connection with discharge end of sluice box, inclined slatted bottom in upper portion of flume, steeply inclined bottom leading from lower end of slatted bottom, chamber below slatted bottom having inclined solid bottom; second flume at right angles to first flume into which inclined solid bottom of chamber discharges, second flume being set in an inclined position, reversible angular portion set in second flume at discharge of first flume to deflect gold-bearing sand in downward direction in lower portion of second flume, and gold-collecting boxes set in second flume having tops formed of fabric material.

ORE CRUSHING MACHINE.—No. 745,710; H. Yarnell, Pasadena, Cal.



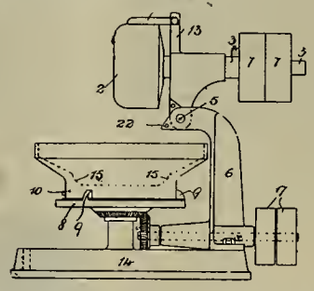
In ore crushing machine, two sets of revolving circular traveling crushing rolls, traveling on treads of different diameter, one set traveling intermediate to the other set, treads for rolls, amalgamating trough intermediate of treads, and means to impart motion to rolls.

PROCESS OF EXTRACTING PRECIOUS METALS.—No. 745,490; T. J. Grier, Lead, S. D.



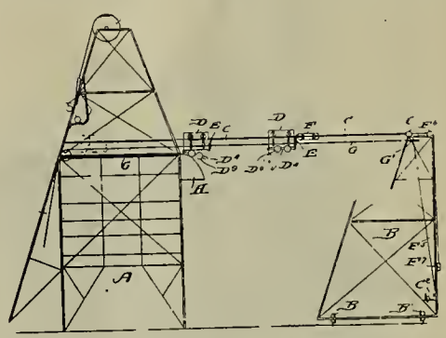
Process of extracting precious metals from slimes, consisting in subjecting slimes to action of cyanide solutiou, whereby watery portions of slimes may be displaced by cyanide solution, latter being of greater density than water of slimes, then treating charge with compressed air and afterward displacing cyanide solution with salt solution of greater density than cyanide solution.

APPARATUS FOR TREATING ORES.—No. 745,472; W. H. Adams, Jr., Los Augeles, Cal.



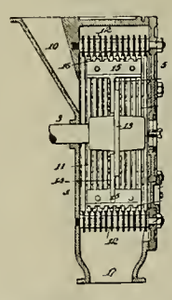
Combination of tank, box, pipe at top of tank connecting same with box, pump connected with box, aud nozzles connected with pump and arranged to discharge liquid into tank at intervals tangentially in approximately horizontal plane.

ORE ROASTING FURNACE.—No. 745,765; A. M. Beam, Denver, Colo.



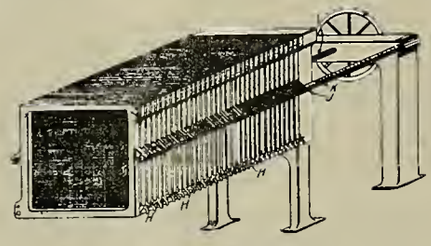
In ore treating furnace, combination of combustion chamber, stack chamber, and revoluble roasting cylinder comprising ore cylinder and flue cylinder surrounding ore cylinder, flue cylinder communicating with combustion chamber and stack chamber and ore cylinder extendiug through combustion chamber.

MORTAR AND MULLER FOR GRINDING, CRUSHING AND MIXING ORES, CHEMICALS, ETC.—No. 745,416; T. Breakell, Wirksworth, England.



Grinding machiue comprising rotary pan or mortar having flat bottom surface surrounded by upwardly projecting curved rim and conical extension or outer rim, rotary muller eccentrically mounted in pan and provided with flat bottom surface and curved lower edge adapted to correspoud with curved rim in pan and means for positively rotating pau.

ORE CONVEYOR.—No. 745,368; A. McCain and T. C. Grierson, Evcleth, Minn.



Device comprising inclined track, buffer, rollers carried on each side of buffer and traveling on track, rollers arrauged below first mentioned rollers and engaging under side of track, pulley arrauged in rear of buffer, cable passing over pulley and connected at one end to buffer, weight attached to lower end of cable, stop, and lug on cable engaging stop and limiting movemeut of buffer in one direction.

PULVERIZER.—No. 745,705; W. M. Wheildon, Boston, Mass.

In pulverizer, combination of inclosed casing, series of rings or diaphragms mounted in casing side by side to form pulverizing chamber having peripheral slots, each ring being formed with outwardly flaring inner face, whereby minimum space between rings is coincident with inner faces, shaft extending into pulverizing chamber, and plurality of pulverizing paddles mounted on shaft.

PROCESS OF EXTRACTING METALS FROM ORES.—No. 745,828; E. B. Hack, Denver, Colo.

Process of treating ores, consisting in forming pulp into cakes and subjecting cakes to leaching action of suitable solution in presence of compressed air which is introduced simultaneously with solution and contiuued during leaching operation.

Thunder Mountain District, Idaho.

Written for the MINING AND SCIENTIFIC PRESS by A. E. BORTHWICK.

The Thunder Mountain mining district in central Idaho comprises abont 5000 square miles of high rugged mountain territory, draining northward into the Salmon river. Roosevelt is the ceuter of the most numerous and active mining operations, and is the only postoffice in the district. Mail delivery is three times a week. Under the wiuter schedule, in force since Nov. 1st, six days are allowed each way from Idaho City, 130 miles south. To Warren the nearest established wagon road is 70 miles northwest, to Custer is 85 miles southwest, and to Salmou City is 115 miles east. The State wagon road, now uuder construction to this place, is used to within about 55 miles of there, where transfer is made to pack animals. Packers have been getting 10 cents a pound for bringing goods in from the transfer point. Few of the stores here arc sufficiently stocked for the winter, and there is liable to be a shortage in provisions before the trails are open in the spring. Suow has alrcady commenced to fall, and thero is from 4 to 8 iuches on the passes. One day's storm will close them probably for the winter. It is not safe to count on using the trails for horse travel earlier than the middle of May, owing to the deep snows on the summits, some of them being at au altitude of 8000 feet.

Over these trails for 100 miles or more have come the supplies and machinery used in developing some of the mines that are included in this great zone of porphyry and quartz that borders both sides of Monumental creek from its head, 6 miles above, to Taylor's cabiu, 12 miles below Roosevelt. Within this area there arc great belts or intrusious of granite, diorite, phonolite, etc., but it is in the great porphyry deposit, in colors white, yellow, red and blue, that the quartz and gold-bearing veins occur.

In the rush of 1901–02 thousands of claims were staked and recorded, many of them iu country rock, with no showing of quartz or ore. Capital bas demoustrated that, while there are barren areas in the porphyry, there are also great deposits within it of quartz porphyry that give from $2 to $8 per ton in gold, and often higher, up to $20 and $30 per ton. As tbe ores are nearly all free milling, and usually very cheaply mined and treated, even $2 ore in the quantities that prevail may be made profitable when properly equipped and worked.

The Dewey Co. has had a 10-stamp mill running all the season. It does not save its tailings or concentrates, nor use tables, and the amalgam plates are on a steep grade. The quicksilver on the plates seems to catcb all the gold, to the satisfaction of the management. The mine is developed by numerous tunnels. The company employs about thirty men. A 100-stamp mill was purcbased over a year ago in anticipation of the earlier completion of the State wagon road, aud it is now awaiting that event.

The Sunnyside Co. has prosecuted work of development this year with twenty-five men, and has exposed a deposit of quartz porphyry 80 feet wide that is reported to assay $10 and upwards per ton. This company, after paying $125,000 for its property, met with much discouragement in the development work, but, after contiuued work for over a year, bas now a property with a large amount of ore in sight, the cost of developing which has been less than $40,000. The company has a 40-stamp mill ordered and ready to come in on completion of the wagon road. It has commodious buildings and improvements, and everything about the mine denotes systematic management.

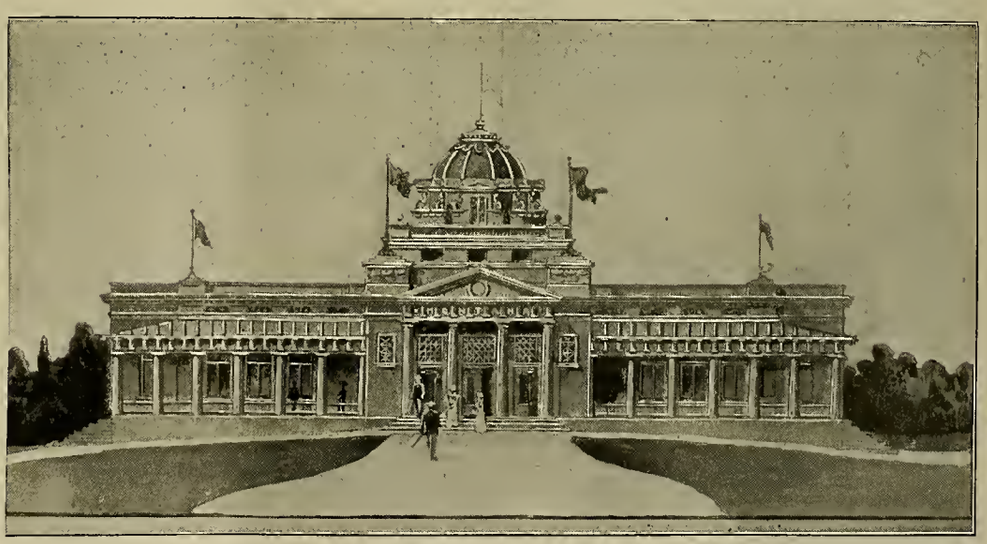
The Fairview Co. purchased three claims for $100,000, situated on the lower slope of Rainbow mountain, opposite the Dewey. After testing the ore deposits and their probable extent and value, the management commenced a working tunnel 500 feet above the town to crosscut the ore body lying beyond. The tunnel is in diorite, and is now in 500 feet, with 800 feet more to drive. Two eight-hour shifts of miners are employed. Jennings Bros. of Pittsburg, Pa., and associates are the owners.

The H. Y. group of eleven claims, bought in September, 1903, for reported price of $100,000, is located on the western slope of Thunder mountain. It has nine tunnels of from 45 to 90 feet in length, and two shafts 30 and 45 feet deep. In one tunnel on the Mollie claim 30 feet of ore assays an average of $4 per ton in gold. No drifting has been done to determine the width of the deposit. The company works a winter force of ten men.

The Climax property adjoins the H. Y., and consists of thirty-seven acres. It has one tunnel of 152 feet and another of 57 feet. The managemeut has contracted to run 100 feet more this winter. A steam hoist, now at the end of the wagon road, will be installed the coming year to test the ore body in depth.

The Rio Grande group of six claims is located on Sugar creek, on the west side of Rainbow. Two veins of quartz porphyry were opeued up this season; one of them is 70 feet wide and the other over 50 feet. Assays show an average above $3 per ton gold. A tunnel was run on the 70-foot vein for over 170 feet. Dean, Duncan & Co. of Colorado have a coutract to continue the tunnel 300 feet farther. The company has a 20-stamp mill ready to send in as soou as the road is ready.

The foregoing are a few of the properties in the porphyry belt. There are many others in various stages of development.



Colorado and Montana Buildings at St. Louis.

Two of the most attractive State buildings at the World's Fair at St. Louis, Mo., will be those of Colorado and Montana.

The design of the Colorado building, now in course of erection, is in Spanish reuaissance. The first floor shows in the center a rotunda, from which ample staircases lead to the second floor. The rotunda has almost the entire height of the dome inside. The ceiling of the dome will be vaulted with intersecting arches, and in the center of the ceiling will be a stained glass light. The remainder of the building is divided into apartments for the executive staff.

Colorado Building at the St. Louis World's Fair.

Montana Building at the St. Louis World's Fair.

Montana's building will be of modified Doric architecture, exemplifying the strength and grandeur of the State. The building has four large and spacious entrances, the main entrance in front being made the feature of the design. The entry at the front, over a wide flight of stairs, opens into a vestibule, which will be decorated by means of columns, pilasters and ornamental frieze. On each side of this vestibule there are closets and check rooms. From here one enters the reception hall and rotunda, extending the full length of the building and divided by ornamental columns, pilasters and beams, all richly decorated. The reception hall is roofed with a dome which extends on the inside to the height of 36 feet above the floor. On the sides are windows. On each side in frout are located parlors or receptiou rooms. Iu front and on two sides are porches. The windows and doors may be so arranged that the entire building can be thrown open, thus furnishing an excellent draught on warm days.

The Strength of American Timbers.

Timber tests which shall determine the strength of the principal American timbers used for construction purposes are now in progress at Washington, D. C., at Yale University, New Haven, Conn., at Purdue University, Lafayette, Ind., and at the University of California, Berkeley, Cal. These tests are made under the direction of the Bureau of Forestry, and are for the benefit of lumbermen, construction engineers and scientific men who are interested in the strength of different wood fibers. The Bureau of Forestry plans from the result of its tests to make tables of the strength of different American woods to which the engineer may refer when he wishes to know what timbers to use for certain purposes. The tests will be in cross beuding and breaking, compression with and against the grain, aud shearing.

No complete and satisfactory series of tests on large sticks of timber has ever been made in this country.

The chief timbers now being tested are the Southern pines and the red fir of the Pacific coast. In the laboratories at Washington tests are now in progress on loblolly pine sticks 17 feet long and 8 by 14, 8 by 8 and 8 by 4 inches. Special attention is given to the effects of moisture on the strength of the wood. In the case of loblolly pine which has grown rapidly, the strength was found to decrease 50% to 60% after the dry wood had been soaked several days in water. The fact, however, is not yet established and will have to be proved by further experiments. The tim-

bers tested are of the usual grades purchased in the market and are not selected pieces.

At the laboratory of the Yale Forest School in New Haven small selected pieces of longleaf pine, without knots or other defects, are being tested so as to learn what is the ultimate strength of the fibers. At Berkeley, Cal., tests are being made on red fir.

These tests of timbers will also be of use and benefit to mining men in the selection of material for surface construction and underground support.

Notes on Classification.*

Written by T. LANE CARTER.

The question of classificatiou is one of importance in the cyanide process. We have been told that we are not up to Australia in many points in the cyanide process, but we believe that many of our Australian friends have gleaned a good deal from the Witwatersrand gold fields and from the pioneers in the cyanide process. It was not so long ago that 25% of our mill pulp was considered untreatable and the slimes assayed between 4 and 6 dwts. In consequence of improvements in classification in the sands tanks aud the use of lime in the mills the value of slimes has come down a great deal, so that the average value of the slimes on one of the large groups, namely, the Rand mines, averaged under 2.1 dwts. for the last six months.

In Rand practice the mill pulp, after treatment by amalgamation, is usually classified into three products for cyanide treatment, namely:

(a) Concentrates and coarse sands.
(b) Sands.
(c) Slimes.

This classification is not really well defined at any point. For instance, where vanners are not used that part which is called conceutrates is really a small portion of concentrates mixed with a large part of coarse sand. The second product, sands, contains an amount of settled slime and sulphurets not caught by the spitzlutte. In the slimes plant we find a very rich float of fine sulphurets, also a very fine sand. When a large portion of main reef, which is generally highly pyritic, is sent through the mill it is difficult to prevent the fine sand and slimy sulphurets from reaching the slimes tanks.

Though one grade blends into another it is, nevertheless, convenient to make the above-mentioned classifications in discussing the question of cyanide treatment. The object of this classification is to grade each portion according to its value and amenability for treatment, so that the richer and less leachable portions might have longer treatment than the poorer and easily leachable portions.

Under the present methods of working, the aim appears to be to mix concentrates with sufficient coarse sands to render the product leachable and to procure sands with as little sulphurets or slimes as possible. This product, which equals only about 10% of the total tonnage, is allowed to receive a very long treatment, an important factor in treating this material.

It will be most convenient to deal with this important question of classification under the headings already mentioned, and we will commence with the first, namely, concentrates:

CONCENTRATES.—A product made up of pure concentrates is of little use for cyaniding in the present state of the cyanide process. In the first place, it is practically unleachable. Even if it were leachable the extraction from this product would be very low. No matter with how much coarse sand the concentrates are mixed to get a leachable product, we must remember that the actual extraction from concentrates by our present methods is unsatisfactory, and that a large percentage of the gold in this class of the pulp is throwu out on the tailings heap. Most of you, no doubt, have verified this statement by dividing a residue sample into the different classes and assaying them separately, when you found that, in the majority of cases, the coarse, heavy sulphurets and coarsest of sand showed highest in gold. Therefore, our present extraction of gold from concentrates, and in some cases from the coarse sands, is unsatisfactory.

This question of concentrates is one that has worried most of us, I am sure. The usual method employed at preseut is to get a product containing 86% coarse sand and 14% sulphurets (the total beiug about 8% to 9% of the mill product) which is given an extra long treatment of about thirty days.

There is one way, of course, of obtaining a high extraction from concentrates and that is by using the chlorination process. But the heavy cost of the process makes it an impossibility for most mines on the Rand. To say when it pays to sell concentrates to reduction works, or to take the much lower but cheaper extraction by the cyanide process, requires careful calculation.

At the New Goch Gold Mining Company we observe that concentrates of nearly five ounces in value are treated by the chlorination process, at a cost of 24.7% of the gross value. It would seem that few mines on the Rand are as fortunate as the New Goch regarding the value of concentrates. On one of the mines of the Central Rand, where close concentration is resorted to, the value of the product has fallen from five ounces to three ounces, so that the treatment of the concentrates by the chlorination process has been abandoned. From the cases we have observed, we notice that concentrates get poorer the lower you get on the reefs.

It seems, therefore, that the chlorination process is nearly at its last ebb on the Rand, so far as the Main Reef series are concerned. Exceptional cases may occur where the concentrates will assay very high, but we believe such cases will be very rare.

We are thrown back, therefore, on the cyanide process, and the question is, how can the greatest extraction be obtained from concentrates by the cyanide process? The extractions obtained from the other classes of sands is most satisfactory, but the efficiency of the process on concentrates is low. Let us take an average case as an example:

A tank containiug 14% sulphurets and extra coarse sand aud 86% coarse sands gave the following results:

Original Value—	After Five Days' Treatment.	After Ten Days' Treatment.	Lowered Value.	After Twenty Days.	After Thirty Days.
12 dwts.....	4.56 dwts.	3.56 dwts.	3.88 dwts.	2.4	1.9

The value of the residue was 1.9 dwts., of which the sulphurets and very coarse sands contained 8.7 dwts. per ton and the other part 17 grs. to the ton. These figures are averages.

From these figures it is seen that after the tenth days' treatment most of the gold had been extracted. On account of the incomplete extraction of the gold in the sulphurets and very coarse sand the charge had to be treated for another twenty days.

It seems to us that the concentrate problem can be most economically solved by following the suggestion made in several quarters, namely, of concentrating carefully and recrushing the concentrates and coarsest saud to a sufficient fineness to extract the gold. The idea is not a new one and has occurred to many. As corroborative evidence as to the possibilities of high extractions from concentrates by the cyanide process, the figures given by Mr. E. N. Fell (see Vol. XXXI, page 764, Trans. Amer. Inst. Mining Engineers) are here reproduced.

In the course of his paper describing the treatment of tailings by the cyanide process on a mine in British Columbia, Mr. Fell said:

"We have also carried out a series of experiments on the treatment of concentrates from the mill in a revolving barrel. The results of these has been so satisfactory that I believe the process would be successful on a working scale.

"The following figures are the result of the last six runs which we made:

Dry Weight of Concentrates.	Value Before Treatment, ozs. Per Ton.	Residue, ozs. Per Ton.	Extraction, Per Cent.	Strength of Solution, Per Cent.	Loss of KCN, Lbs.	Duration of Treatment, Hours.
40 pounds....	7.58	.20	97.4	1	6.2	24
40 "	5.26	.76	85.5	1	8.1	24
40 "	4.74	.42	91.1	1	7.8	24
40 "	2.78	.14	94.9	1	9.75	24
40 "	4.60	.36	92.2	1.25	6.4	24
40 "	3.92	.12	96.9	1	6.1	24

"I infer that a recovery of at least 90% (and probably 92% to 93%) of the gold value could be ensured at a cost for cyanide of 8s 6d per ton."

This evidence, taken with the evidence of the Rand, gocs to show the possibility of getting a higher percentage of the gold from the concentrates by the cyanide process.

The two reasons given for the failure of KCN to give a high extraction from pure concentrates in the ordinary way are:

1st. The gold is "mechanically bound."

2nd. The unleachable character of the product.

Taking everything into consideration, we believe that the concentrate problem can be most economically solved along some such lines as the following:

(a) Classifying of concentrates and very coarsest of sand as clean as possible by means of increased spitzlutte capacity.

(b) Recrushing and treating these concentrates and very coarse sand in a revolving barrel or some similar contrivance with KCN of suitable strength.

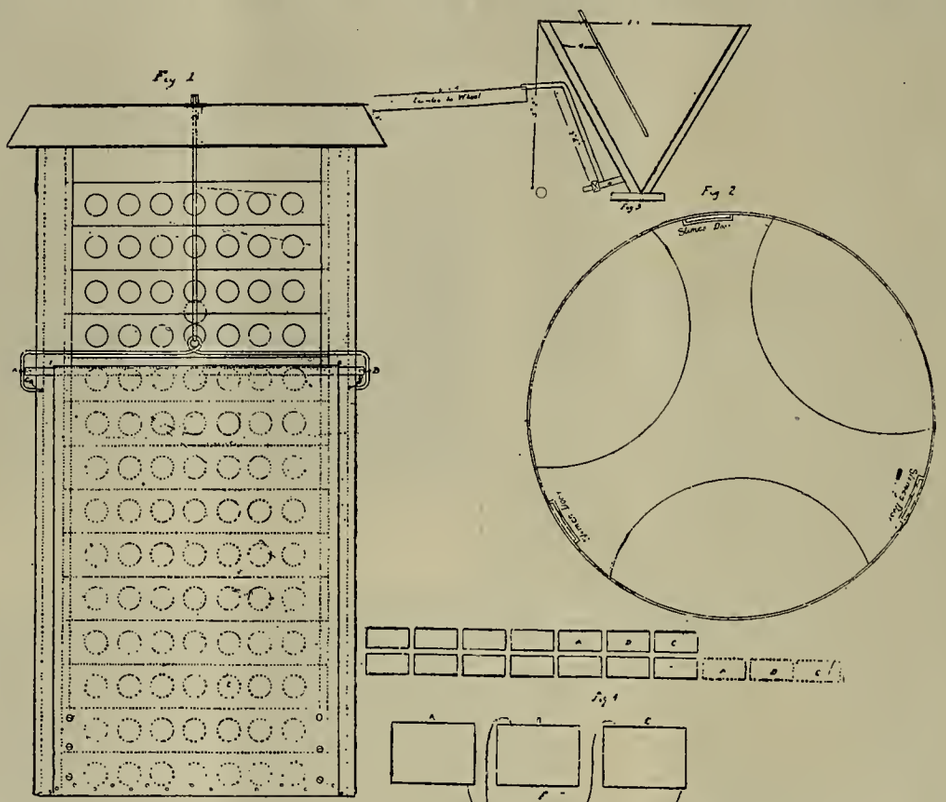
(c) This careful concentration will allow the finer portion of coarse sand to run iuto the tanks with the fine sauds, thereby causing a more leachable product.

Of course, the extra expense of recrushiug conceutrates must be recognized, but we would like to point out the probable advantages to be derived:

1st. Considerably higher extraction. It does uot require a large increase in extraction on the Rand to mount up to thousands of pounds sterling.

2nd. A more amenable sand product by the addition of more coarse sands to the sand tanks.

3rd. A great säving of timc; also of cyanide.



4th. The utilizing of portion of the tank capacity now occupied by concentrates and very coarse sands to sands, thereby giving sands an extra two days' treatment.

Opinion seems divided as to the amount of amalgam that escapes from the mill to the cyanide works. We know of a case where a chemist was sent to a gold mine on a certain gold field to investigate a by-product of the tailings heap. It became necessary to van a portion of the old coucentrate heap, and this chemist obtained an apprcciable amount of amalgam on the vanners. This seems to prove that amalgam getting into cyanide tanks from the mill is lost.

SANDS.—The filling of a sand tank is one of the important things of a plant, a badly filled tank causing the residue to assay high. There are two systems in vogue on the Rand, namely the "Kafir and a hose" and the Mein-Butter's distributors. In filling it is necessary to be watchful to prevent the formation of thick layers of slime. The danger of getting layers of slime in the tank is increased where much lime is used in the mills.

Fig. 2 gives a sketch of the method used in filliug a sauds tank. The high cones of sand are shown between the slimes doors. The water carrying the slimes thus has every facility of escaping through the slimes doors. The Kafir keeps the hose on the move, so as to disturb any settled slime.

A sketch is given (Fig. 1) of the slimes escape

Escape Doors in Cyanide Tanks.

*Abstract Journal Chem., Met. and Min. Soc., S. A.

doors in use on the Crown Deep. The heavy canvas is securely nailed down at the bottom. As the tank is filled the cauvas is unwound from the spool which slides up and down the two grooves. It is found that the slat boards answer best, being strong euough to withstand the pressure. In each board there are holes to allow the slimes to run off freely. All the slats are placed in securely, except the two bottom ones, which are screwed to the uprights, so they can be easily taken out in case of a block behind with sand.

(TO BE CONTINUED.)

Mine Telephone System.

Some one has aptly said that "economy is simply the judicious expenditure of money," and the remark continues to be quoted because it cannot be improved. Anything that saves expense is of economy about any surface or underground workings, and the convenience and usefulness of a mine telephone system is now becoming generally recognized. The chief objection—defective insulation and trouble from moisture—has been overcome.

The mine telephone, illustrated herewith, is built especially for mines, outdoor use and places where an instrument is subject to gases, acids or moisture. The apparatus necessary for the operation of each telephone is mounted in a cast iron moisture and weather proof case (Fig. 1). The generator is pow-

FIG. 1

erful enough to ring fifteeu or twenty telephones on the same line. The ringers are mounted in the dome on the upper part of the case with an opeuing on each side, so that a call may be heard at some distance from the telephone. These openings are so arranged that the ringer is protected not only from the weather, but also from mechanical injury. The talking and calling apparatus is located in the lower portion of the case, and is arranged to suit the purposes for which the telephone is supplied. All wiring in the instrument is done with rubber covered wire and all joints are soldered. An arrangement is provided for taking up the slack of the receiver cord when the receiver is replaced on the hook. (Fig. 2).

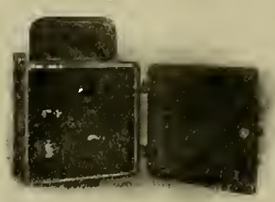


FIG. 2.

A lever on the outside door of the case enables one to close the instrument up air-tight; the door fits agaiust a rubber gasket. All exposed metal parts are treated with an insulating gas and moisture-proof compound. The inductiou coil, geuerator armature coil, ringer coils and receiver coils are boiled in a moisture-proof shellac varnish compound and afterward baked. This reuders the coils moisture-proof. The outside of the case is painted black and striped

FIG. 3.

in gold. The lugs on the back of the case for fastening it up are cast separately from the case and can be removed and other styles of fastening used if desired. A small cap containiug the line binding posts is fastened to the bottom of the case. Line wires from same are led out through an iron pipe screwed into the cap.

This mine telephoue system is furnished entire by the Stromberg-Carlson Tel. Mfg. Co., 70-86 W. Jackson Boulevard, Chicago, Ill., who have numerous testimonials from mining men as to its satisfactory operation.

That Number Scheme, Again.

TO THE EDITOR:—I note the commeuts of "Mine Superintendent" in your issue of Nov. 7th on my article entitled "A Number Scheme for Mines," aud I think I may add a few further words with benefit. The gentleman says:

"In workiug both ways from the shaft the system could be carried out by calling one side arbitrarily north or south, east or west, as the case may be."

Where there is but one vein this will work very well; but when crosscuts are ruu and the usual parallel veins are developed, it will not be so simple as the plan of lettering the veius as suggested in my article. To illustrate: We have worked the Kennebec vein north and south from the workiug shaft. There being no other vein, there is no need of naming the vein in any reference thereto, so we number the chutes and add N. or S. as the case may be, and there is uo danger of complication. In the course of development we drive a crosscut and open the Jerusha, a vein paralleling the Kennebec. Followiug the suggestion of your correspondent, we must mark the chutes on this vein N. and S. To distinguish the chutes we must now name each vein and follow the number of the chutes with N. or S., as, Kennebec 522 N., Jerusha 514 S., etc. By lettering the veins we are enabled to designate each of these locations by much less work, thus: 522 A would auswer for Kennebec 522 N., and 514 C for Jerusha 514 S.

The suggestion of "Mine Superintendent" as to the numbering of the chutes and raises is also open to the objection of requiring more words to designate the locatious than are necessary. Iu the system I suggested the even numbers were used for chutes and the odd for raises, so that the number itself designated whether the place was a chute or raise and saved the trouble of using the words. Using the uumbers in this way there will eveu then be numbers to spare, so the odd uumbers are uot needed to designate chutes.

Not long since the writer accompanied a gentleman through a mine where samples were being taken. In a certain raise where this gentlemau took his sample he turued to the foreman of the mine, who accompanied us, and said: "I mark this sample 'F. W. seam on main vein, above the 200, where Gunderson is working.'" That abbreviated by a few words was the marking of the tag that went to the assay office. It designated plainly where the sample came from and was all right for the time being, but I couldn't help thinking that if that face were abandoned temporarily, because of a low assay, and the records should be consulted later to find out what the assay went, one might easily be confused by finding a number of samples marked "Gunderson," and not knowing what one referred to this particular place. With the mine numbered as suggested in my article, the sample tag would have needed but three figures and one letter, as 283 B. That would locate the place definitely and a reference to the assay record would tell the result of a sample taken from the face on the date indicated. Several samples might be taken from the raise at one sampling and marked right side, left side, F. W. or H. W., or other specific designation, in additiou to 283 B, that still being the key to the location.

Recognizing that ore bodies are not continuous in size and that the skilled mining man will start raises and put in chutes where he thinks he can work the mine to advantage, I sought to make plain that the numbers for the chutes would give the approximate distance from the workiug shaft, a few feet one way or another being of no consequence, and it being immaterial whether the chutes are 25 or 100 feet apart, each 20-foot section having a uumber. In a worked-out section of the mine under the writer, on the 100-foot level, the first chute on one side of the shaft is 54 feet distant; it is 93 feet to the next chute and 32 feet from that to the third, so the first chute would be 106, the second 116, the third 118. The secoud chute is 147 feet from the shaft. If it were 140 feet it would be uumbered 114, but being 7 feet farther it is thrown into the uext sectiou and receives the number for the eighth section from the shaft, viz., 116. The third, though 32 feet from the second, is ouly 179 feet from the shaft and comes within the next section, and is numbered 118. The unused numbers will never be ueeded, the ore above having been all worked out.

The writer has kuown operators to give names to the individual shoots, as the Clevelaud, or Jumbo, for shoots of size, the Tyler for a narrow shoot, etc. The scheme is good, but not so good as the number scheme. It takes fewer words to direct an employe to go to work at 215 A than to tell him to work in the raise on the Cleveland shoot on the 200. One who installs and uses the number scheme will soon learn to appreciate its many advantages. It has definiteness, with the use of as few characters as possible, at the same time allowing latitude for lines and measurements in solid rock that cannot be and do not ueed to be made exact, aud it is easily understood by the men when ouce explained to them.

MATT. W. ANDERSON.

Baldbutte, Mont., Nov. 28.

Quartz Veins and Mines of Southern Oregon.*

Written for the MINING AND SCIENTIFIC PRESS by DENNIS H. STOVALL, B. S.

It has long been taken for granted, by a few at least, that the stratigraphical formation of southern Oregon is identical to that of northern California. Notwithstandiug the similarity of the two sections, there has been a vast difference in the developmeut aud progress of the two. The imagiuary line, known as the State liue, was sufficient to keep the enterprising mining meu ou the California side for a uumber of years; and while the camps and mines of northern California were flourishing, southern Oregon was making little or no progress in the matter of the development of its quartz mines. Southern Oregon is the pioneer mining section of Oregon, yet it has been the slowest in development. This condition of affairs was due entirely to lack of enterprise, lack of capital, lack of men who possessed an ambition to go deeper thau their shovel handle's length!

It required a half century for one question to be solved to the satisfactiou of moneyed mining men; this was the question of the continuity of the ledges of southern Oregon. It was not until the past two years that this question was satisfactorily answered, and even yet there are some who are skeptical and who have but little faith in the permaueuce of southeru Oregon's veins.

The vein matter of southern Oregon ledges varies but little throughout a wide extent of territory. Nearly all of the veins of the district run uorth aud south—that is to say, those ledges aud lodes which can be traced for any considerable distance.

In the western part of the district, and runuing aloug the westeru border of Josephine county, is the base mineral belt, the predominating values being in gold and copper. This belt, popularly known as the "copper belt" of southern Oregon, is really confined to one mammoth ledge, known as the "Yank." It is from 75 to 250 feet in width, and cau be traced from the Oregou-California line north for a distance of 40 miles or more. In those districts where it is exposed, notably Waldo, Slate Creek and Galice Creek, mines are being opened up upon it. A number of these are well developed and will be ready to begiu operatious next summer. The veiu matter of the Yank ledge is mainly a bluish quartz colored by copper, this metal being present in the form of copper pyrites. The Yank is a contact vein with a hangiug wall of slate, and syenite on the foot. In those tunuels that have been driven into it there is a thick coatiug of the soluble salts of copper. In the Waldo district there are eight or nine well developed mines on this belt. The values of these run higher in copper than farther north, assay returus showing from 11% to 60% copper and from $2.50 to $10 a ton in gold.

Farther north, on Galice creek, where the big ledge is cut by Rogue river, and where several miues are being opened up, the quartz shows from $6 to $30 a ton iu gold and copper. As the ore will require smelting, and occurs in largc quantity, some of these mines will probably become great producers when worked on a scale commensurate with their size.

The vein matter of the gold-bearing ledges of the southern Oregon district may be described as a hard, white and compact quartz, carrying metallic sulphides to a greater or less extent, and free gold, with some silver. The metallic sulphides consist of pyrite, copper pyrites, arsenical iron and galena. The last-named mineral has been found to be a "good sign" in southeru Oregon quartz veins, its preseuce being considered indicative of good values aud coutinuity of vein.

The average value of the veins may be considered as indicated by those of one mine. (Sec illustratiou, front page.) The Greenback, Grave Creek district, is a fair represeutative. It is operating forty stamps and a 100-ton cyanide plant, and opened to a depth of 1000 feet, and is a typical southern Oregon mine. Its values, it is stated, have averaged $16 a tou in free gold and concentrates since the mine first begun operatiou. Its ledges are from 2½ to 5 feet in width, with a dip of from 60° to 70°. The couutry rock here is diorite. There are other good miues in the southern Oregou district—mines that are operatiug mills of five to fifteeu stamps — that possess similar ledges, but which lie in granite, slate or other formations.

Much "specimeu rock" is produced by the mines of southern Oregon. This is due to the buuches of rich free-milling ore that are found at all depths, and more especially at cross sections of smaller veins with the main ledges. This is the "pocket" characteristic of the district, and it is not lost eveu in the largest mines. On the 800-foot and 900-foot levels of the Greenback masses of quartz have been shot down that were "peppered" with large and small fragments of gold. Flakes of the metal as large as a man's palm have been uncovered on the deep levels of this property. Nearly all of this free gold is found in hard, suow-white quartz.

But the ledges aud veins of the southeru Oregon district are more than "specimen rock" producers. They are permauent, as is proved by the success of

*See illustration on front page.

those who have energetically developed properties. The characteristics and general formation of the country makes the deep development of mines in southern Oregon expensive, but the results have proven satisfactory.

Treatment of Telluride Ores at Kalgoorlie, Western Australia.*

NUMBER II.

Written by W. E. SIMPSON.

ROASTING.—At the Boulder Main Reef mine the ore is conveyed from the mills to one of two small storage bins, which supply the three Edwards furnaces, each treating on an average eighteen to twenty tons per day. This type of furnace was first introduced to these fields by the Great Boulder Proprietary Co. some four and a half years ago, and until recently it had superseded all others. It is a single-hearth reverberatory furnace, with mechanical rakes, enclosed in a casing of boiler plate. The sides are made of two girders, each 60 feet long, built on the cantilever principle, and the ends of plain ¼-inch plate, while stout corrugated iron sheets, bolted to the lower web of the girders, act as the support for the 6-foot wide bed or hearth. The frame of the hearth, properly stayed and strengthened where necessary, is supported about 2 feet clear of the ground upon a couple of pivots placed midway between the ends, and it is held rigidly at the desired inclination by a couple of jackscrews. The rabbling is done by a line of fifteen revolving rakes, with vertical stems or shafts passing through the furnace arch; the actual stirrers are five small removable plows, attached to a cast iron arm, which describes a horizontal circle in the ore. Each revolving rake or rabble moves in the opposite direction to its immediate neighbor, and the ore is thus made to travel in a zig-zag course along the bed of the furnace. All the mechanism is easily accessible; the rabble bearings, gear wheels, shaftiug, etc., being held in position in an iron framework on top of the furnace. The five rabbles nearest to the firebox are hollow and are kept cool by a stream of water which is constantly passing through a central pipe in each, and, after ascending, escapes into a channel ring encircling the rabble axle on top of the arch. The inclination of the furnaces at the Boulder Main Reef Co.'s works is about 9 inches in the total length, 60 feet. The layer of ore is usually 2 to 3 inches deep on the hearth, and two hours are occupied in its journey from the inlet to the discharge.

Each furnace is fed by what is known as a "fluted roll." It is a cast iron cylinder, 3 feet long and 10 inches in diameter, with eight V-shaped channels on its circumference. It is carried by a horizontal axle, to which is also keyed a ratchet wheel with forty teeth. The roll is let into the front of the bin on a level with the bottom, and is always partly embedded in the powdered ore, which fills the channels, and is discharged into the furnace as the roll rotates. The rate of feed depends on the rate at which the roll revolves, and this is regulated by the ratchet mechanism. The power is obtaiued through an adjustable eccentric keyed on to the shaft which drives the furnace rabbles.

The Merton furnace has recently been introduced by the Great Boulder Proprietary Co. to the Kalgoorlie field; in its main features it is similar to the Edwards. Its chief differences are that it occupies less area, has three super-imposed hearths, all level and communicating with one another by vertical channels in the usual way, and is built directly upon the ground, instead of being placed in an iron framework, and, consequently, the angle of inclination of its hearths can not be changed. The rabbles, five in number, are in principle precisely similar to those of the Edwards furnace; but each rabble stem passes through all three hearths and is supported by a footstep underneath the lowest hearth, the arms or rakes being clamped on at heights to suit the different hearths. This arrangement, however, would appear to be somewhat disadvantageous in the case of a breakdown necessitating the withdrawal of the rabble shaft. The Merton furnace is economical in the consumptiou of fuel, as the arch of the lower hearth heats and really is the bed of the one immediately over it. The roast, too, is better, as the ore falls in a shower through the flame in its passage from hearth to hearth. This is, however, accompanied by a somewhat greater loss in dust. Its initial cost is considerably less than that of the Edwards, and its capacity some 20% greater.

The Edwards furnace can be altered by varying the angle of inclination of its hearth to suit the composition of the material being treated. A heavy sulphide would require a small inclination so as to make it travel slowly towards the flame, while a partially oxidized material could be treated more rapidly by having the furnace tilted at a greater angle. This is advantageous in a customs works treating many different parcels of concentrates, etc.; but on a mine where, as a rule, the ore does not suddenly alter in composition, the possibility of varying the inclination is of little or no use. As a matter of fact, the beds of the furnaces on the Boulder Main Reef have been kept with the same inclination—9 inches in 60 feet—since first erected, and are now all bricked in. With the Edwards furnace it seems possible to obtain still better results by allowing the hot, waste furnace gases, after passing over the ore, to travel back in flues underneath the hearth in a tortuous fashion, thence to the stack in the same manner as the gases of a Lancashire boiler. The ore, too, might be made to travel in a conveyor along the top of the furnace, as is now being done with the concentrates at the Lake View Consols gold mine, and so be fed into the furnace hot, and just on the point of oxidation. A further improvement would be to make the rabbles hollow throughout and open at both top and foot, so as to allow an air current to be drawn through them into the furnace. This would be better than the present plan of taking in the air through furnace doors open, because the air would be heated and so rendered more energetic for roasting; besides, the air current would keep the rabble cool. From 2 H. P. to 3 H. P. are required for each furnace.

The raw ore of the Boulder Main Reef contains about 3½% sulphur as sulphide, and the roasted product from a mere trace to about .04%. The success of the "dry process" depends largely on the "sweetness" of the roast, and the presence of more than .05% of free sulphide begins to tell seriously upon the extraction. Sulphides are generally supposed to interfere with, or, rather, prevent, the solution of the precious metal; but it seems more likely that the apparently poor "extraction" is due to the subsequent precipitation of the gold by the sulphide in the pulp. At any rate, it is nearly always found that in the residues from a foul roast nearly all the valuable part is contained in the "fines;" if residues assaying, say, 7 or 8 dwts., are sifted, the coarse particles retained on a 200 sieve will often contain only from 2 to 3 dwts. of fine gold per ton.

The roasted ore is discharged from the furnace through a small orifice in the side and falls into a push conveyor. This consists of a semi-circular though about 60 feet long, provided with a ladder-like frame, with blades hanging from the rungs, which is made to move horizontally to and fro on rollers. The blades are free to swing in one direction, but are prevented by a stop from swinging farther back than the perpendicular. When the ladder is traveling forward each blade hangs vertically and pushes a little heap of ore before it for a distance of 20 inches, the length of the stroke. On the return stroke the blades, being free to swing, slip over the tops of the little heaps, and, on the completion of the stroke, resume their original vertical position. A succession of these pushes conveys the hot ore to the end of the trough, and, by alternately collecting and then flattening the little heaps, exposes new surfaces to the oxidizing atmosphere and so improves the quality of the roast.

From the conveyor the ore falls into a rapidly flowing stream of weak cyanide solution and the dry part of the process is at an end. The pulp thus formed is elevated by a tailings wheel to the spitzkasten, where it is separated into sands and slimes. The sands, together with any free gold, go to the grinding pans and the slimes direct to the agitators.

The fuel in use in Kalgoorlie is the local salmon gum, a species of eucalyptus. It is of excellent quality and can be delivered at the mines at about 13s 6d per ton. The consumption amounts to about 2.6 tons per day (twenty-four hours) for each Edwards, and 2.4, or slightly less, for each Merton furnace.

The grinding pans are of the Wheeler type, six in number, and each 5 feet in diameter, and all of them were required when the plant was running to its full capacity of 2000 tons per mouth.

The charge of quicksilver is 10 lbs. per pan every ten days, and the loss of mercury is .2 to .3 oz. per ton of ore treated, or 25 to 30 lbs. per month. Each pan is cleaned up once a fortnight.

The shoes and dies are of iron and last from six to seven months. The weight of a complete set is 33 cwt. and the cost delivered on the mine is £33.

GRINDING AND AMALGAMATING.—The free gold becomes amalgamated in the pans and the sand is reduced to a slime. The pulp then goes to another set of spitzkasten and any coarse sand still remaining is separated out and returned for regrinding in the pans, the slimes passing on to the agitators. It will thus be seen that every particle of ore is eventually reduced to a fine slime.

Each pan makes sixty revolutions per minute and requires nearly 7 H. P. to drive it.

The flint mill is a hollow revolving steel cylinder, 16 to 20 feet in length and 4 or 5 feet in diameter, and closed at both ends, except for a small central opening in each. It is lined completely with cast iron or steel plates ¾ to 1¼ inch thick, and when in operation is partially filled with a charge of hard flint nodules. The sand is forced from the nozzle of a spitzkasten through the central opening in the receiving end, is ground in the mill and escapes as slime at the discharge orifice. One flint mill is sufficient for a 2000-ton per month plant using a 30-mesh wire screen, and the work is done so efficiently that 99%, or practically the whole, of the finished product will pass through a sieve of 200 holes to the linear inch. A complete set of liners weighs about 4 tons, lasts from seven to ten months, and costs £80 on the spot. The working charge of flints ranges from 4 to 6 tons, and about 1 cwt. of flints is consumed in grinding 100 tons fine enough to pass through a wire screen with 30 holes to the inch. Each mill consumes from 18 H. P. to 35 H. P., according to size, makes thirty revolutions per minute, and when working efficiently emits a low, dull note or roar, easily recognized by an experienced attendant. The function of a flint mill is to pulverize, while the pan has not only to grind but also to amalgamate.

For obvious reasons the flint mill can not be used as an amalgamator, and copper plates are decidedly objectionable in either case for the following reasons: All the waters traveling through the Kalgoorlie plants are in reality dilute cyanide solutions. Even battery waters carry from a mere trace up to .03% of free cyanide. The amalgamating plates are, consequently, rapidly corroded, as, for example, those of the Hannan's Star and the Kalgurli gold mines, which have to be replaced every nine months, and the dissolved copper must be precipitated subsequently in zinc boxes. The objection, therefore, is twofold, the destruction of the plates themselves and the production of impure, coppery bullion.

In performing their duty, pans polish and brighten the metallic particles and thus promote amalgamation, but, on the other hand, flint mills tend simply to flatten them and, consequently, amalgamation is retarded.

In my opinion the best results could be obtained by a combination of both these appliances—one or perhaps two pans to catch all the free gold and perform the rough grinding, and flint mills to complete the pulverization into an impalpable powder or slime.

(TO BE CONTINUED.)

*Abstract Trans. Institution Mining and Metallurgy.

The Silverton District, Colorado.

Bulletin No. 182 of the United States Geological Survey has proved so popular that, the supply of the original issue having been exhausted, a reprint has been published. This bulletin is the work of F. L. Ransome and is entitled, "A report on the economic geology of the Silverton quadraugle, Colorado."

The report is divided into two parts, a general description and discussion of the ore deposits of the district and detailed descriptions of special areas and individual mines. In the first part, the history, production, climate, vegetation, topography and geology of the Silverton quadrangle are considered. The methods of mining and treatment of ores are briefly described. The ore deposits are classified as lodes, stocks and replacement deposits, and are fully discussed with reference to their mineralogical character, origin, geological relationships and economic importance. The mineral waters associated with the deposits, the metamorphism of the country rock in connection with ore deposition, the origin and paragenesis of the lode and stock ores, the ground water, and the miscellaneous mineral resources of the quadrangle, aside from the important ores of gold, silver and lead which constitute the chief mineral wealth of the district, are some of the special themes handled in the first part of the report.

The lodes of Silver Lake basin, of Hazelton mountain, of King Solomon mountain, of Cunningham gulch, Galena mountain, Burns gulch, Sunnyside basin, of Placer gulch and Treasure mountain, of Mineral point, Henson creek, Poughkeepsie gulch, Uncompaghre canyon, Canyon creek, Savage basin, of the Red mountain region, Sultan mountain and Cement creek are discussed in the second part of the report.

The first production of gold ore in this district was in 1870, and Mr. Ransome estimates that the total production of the Silverton quadrangle from the beginning of mining activity to the close of 1900 was at least $35,000,000. The greater part of this has undoubtedly been of silver, but during recent years, largely owing to the activity of the Camp Bird, Tomboy and Gold King mines and to the lower price of silver, the value of the gold output has predominated.

The field work upon which this report is based occupied the season of 1899 from the beginning of July to the middle of October. The work was resumed in the autumn of 1900 and a period of six weeks was devoted to those portions of the quadrangle that had not been thoroughly studied in the preceding year.

The reprint of this report may be obtained by application to the Director of the United States Geological Survey, Washington, D. C.

$25, Not $35.

TO THE EDITOR:—In the article on "A System of Continuous Concentration of Ores by Oil," written by me for the MINING AND SCIENTIFIC PRESS, which appeared in the issue of Nov. 7, 1903, I note on page 304, where it says: "Two hundred and eighty-five tons of silver-copper ore was selected from the mines of Julio, Celia and Santa Teresa, the average assaying value being about $35 per ton."

The amount stated, namely, $35 per ton, was an error of my copyist, and overlooked in furnishing the manuscript. It should read $25 per ton. Will you kindly make this correction?

JAMES W. VANMETER.

San Francisco, Cal., Dec. 4.

Mining Summary.

SPECIALLY COMPILED AND REPORTED FOR THE MINING AND SCIENTIFIC PRESS.

ALASKA.

C. D. Lane of San Francisco and J. H. Conrad of Prince of Wales island have bought the Heid & Smith copper and gold group, on Windfall creek, on Prince of Wales island. The property consists of five claims, with favorable millsite, together with water and plenty of timber. One principal ledge and several smaller lodges of ore are said to cross the claims. Development work will be started in the spring.

Skagway prospectors returning from the stampede to Bullion and Sheep creeks, in Alsek district, 140 miles from White Horse, report finding gold on both creeks, and washing pans running from 5 to 70 cents. Between 200 and 300 claims have been staked. Weather conditions prevented spending much time to prospect. Bullion creek is staked to No. 75 above, and Sheep creek nearly as far. Between No. 30 and No. 42 above on Bullion runs a deep canyon. Dawson Charlie, who discovered the district, and his companions were found to have staked many claims; but white men did not hesitate to restake, laying a basis for their disputes and litigation with the Indians next year, report H. C. Boardman and G. W. Dellon.

Another flowing well is reported struck by the Alaska Development Co. on its land near Catalla, opposite Kayak island. The well is 1000 feet from the first well struck by the company. The drillers were at work forty days, going down from 25 to 40 feet each day, before oil was struck. It is said to be a flowing well, but not a gusher. The company is building a 1000-gallon tank near the wells, and a pipe line will be run to the drilling plants, so that oil can be used under the boilers instead of coal. The Cudahy Packing Co., the Alaska Petroleum & Coal Co. of Seattle, Wash., and Chancellor & Canfield, California operators, have drillers at work in Kayak district.

The Fairview group of mines, consisting of three claims across the bay from the Julian mines, near Juneau, have been bonded to Lane & Conrad.

W. E. Dickinson of the Nome Mining Record says the gold output of Nome district this year will aggregate $6,000,000.

ARIZONA.

Cochise County.

The Luckshire mine, near Tombstone, has been bonded to H. M. Morris of Chicago, Ill., for $25,000. Men will be put to work sinking the shaft and on other development. The Luckshire adjoins the Lucky Cuss.

Graham County.

The annual report of the Shannon C. Co., operating at Clifton, for the fiscal year ended August 31, shows:

Profit and loss account—Gross profit for four months' running time	$158,971.29
Less loss previous year made up from this year's earnings	20,818.70
Net gain	$138,152.59
Less loss caused by fall in price of black copper last year after inventory was taken	8,333.63
Profit for year	$129,818.96

President Gill says the report covers a period of many interruptions and of a continuous run of only two months, caused by the miners' strike of June 1, viz.: July and August.——During the year a contract was let for a 500-ton concentrator, designed in two sections, of 250 tons of ore daily capacity each. The first section of this plant has been running since March 7, its work being entirely satisfactory. The second 250-ton section is being set up and is expected to be in commission by February next. In January they installed a briquetting plant which takes care of the flue dust, etc. Prospecting and development work has been increased, opening up additional ore bodies. There were driven during the year 7107 feet of tunnels, shafts, winzes, etc., and the mine now has 5½ miles of underground workings.

Larger hoods have been placed over the converter stands at the Arizona C. Co.'s plant at Clifton.——A. Roscerans, manager of the Standard copper mines, near Morenci, says the aerial tramway is nearing completion. The work has been delayed by difficulty in getting the heavy timbers up the mountain side.

Maricopa County.

(Special Correspondence).—The owners of the White mine, in White Tank mining district, are getting out ore for shipment. They have hauled 400 sacks of ore to Beardsley.——The Jones & Porterie group of three claims have been sold to F. Webb.

E. E. Hewins has men at work on a group west of Frog Tanks, and also at the Pike's Peak mine.——The Arizona M. & Dev. Co. is working men at the Black Jack mine, west of Morristown. This mine is a silver-lead producer.

The Lime Creek smelter, near Alhambra, is being put in shape for another run. The Lime Creek Copper Co. has bought several claims in Cave Creek district.

Ensign Bros. report locating a group of claims in the mountains south of Phœnix. It is a cyaniding proposition.——O. D. Merrill has men at work on a gold-bearing group north of Mesa.

Men are at work at the Bismuth mine, near Phœnix, and reduction works will be built.

Phœnix, Dec. 7.

(Special Correspondence.) — Dunn & Welch have 900 feet of development work done on their mine in the White Tank district, near Buckeye. The ore is free milling.——Stewart & Rogers of Mesa continue developing their claims. They are getting ore for milling.

There is considerable activity in Cave Creek district at the present time.

Phœnix, Dec. 7.

Mohave County.

The John T. group, 4 miles from the Contact mines, Cottonwood district, is being worked by a company, with J. F. Tomlinson as superintendent. The main claim of the group shows a vein averaging 15 feet in width, with values in gold. The ore is free milling. The Cottonwood district is east of Hackberry, and the main camp is reached by wagon road from Peach Springs, 12 miles. There is said to be plenty of water and wood in that section for mining and milling purposes.

The Philadelphia & Arizona M. Co. has unwatered the Minnesota-Connor mines, and are preparing to reopen them.

The Cedar Valley M. Co., at Cedar, has contracts for a brick plant at the mines, and for the manufacture of 250,000 bricks. They are to be used in construction of a smelting plant for handling the product of the concentrators. When the plant is completed the mines will be equipped with additional machinery, and the raw ores handled in the most economical manner. The company has also let contract for building a wagon road from Yucca station on the Santa Fe to the mines, a distance of 23 miles. The roadbed will be built along grades on which rails can at any time be laid, and the road equipped with electric motor and rolling stock, says the Kingman Miner. The mines and mill are under management of R. G. Eckis.

The Gold Roads G. M. Co., near Acme, last week shipped two bars of bullion valued at $24,000, the cleanup from two weeks run of the mill. The bullion is valued at $15 per ounce. The company is reported in a position to keep up this bullion shipment regularly.

It is reported the Katherine and Sheeptail group of mines in the San Francisco district, near Kingman, 2 miles from the Colorado river and 10 miles northeast of the Gold Roads mines, have been sold to a company of Kansas City, Boston and Detroit men. The property was owned by the New Comstock M. Co., S. C. Bagg, manager. The ledge is 30 feet wide and the ore is free milling, carrying values of $6 per ton. There is a 20-stamp mill and a cyanide plant on the ground. The company proposes to use oil for fuel, and will ship it by rail to Needles, Cal., and from there 40 miles up the river to the mill.

The hoist for the Altata mine, near Chloride, is being set up.

Preparation is being made for sinking on the White Copper mine at Mineral Park, says Superintendent J. Uncapher. It is the intention of the Queen Bee Co. to sink the shaft to considerable depth to obtain water for milling purposes and at the same time develop the ore bodies.

Work has started up on the Elkhart mine, near Kingman, and more men will be put on next week. They will sink to a depth of 1000 feet.

The salt mines of the Virgin valley, near Kingman, are to be worked, says the Kingman Miner.

Pima County.

The Loma Verde C. M. Co. is resuming work on its group in the Rincon mountains, 18 miles east of Tucson, under the management of T. J. Driscoll, who says he will continue to sink to depth of 1000 feet.

Pinal County.

(Special Correspondence.)—J. N. Harn, superintendent of a group of mines owned by California parties, near the Silver King mine, 35 miles from Florence, has begun oporations.

Machinery and supplies are on the ground for the Arizona-Pacific Co. Superintendent S. C. Prouty reports work progressing on the mines. Sinking in the two double compartment shafts will be started this week.

Florence, December 6.

(Special Correspondence).—S. W. Guardam, operating in the Butte mining district, east of Florence, reports development work progressing.——J. H. Henness is developing his copper claims, near Kelvin. He is sinking a shaft.——Peterson Bros. expect to resume work on their claims next week. The ore carries gold, silver and copper.

Florence, Dec. 7.

Last week the Lake Superior & Arizona M. Co. made final payment of $30,000 on their group on Queen creek, near Silver King, which the company has held under a working bond. Superintendent A. C. Sieboth has kept thirty miners exploiting the group. Machine drills were used and a large amount of shaft, tunnel, drift and crosscut work was done, says the Florenco Blade.

J. De Armett reports taking out copper, iron and silver ore from his claims in the Big Wash district, 12 miles east of Florence. He with H. Brady located five claims along the bank of the wash and started work on the main lead, which is 10 feet in width, which they are opening up through tunnels.

Yavapai County.

The Old Mesa G. Co. of Big Bug will extend the tunnel being run on its group. The tunnel is in 380 feet and the contract calls for driving 300 feet more. E. Block, manager of the Gold Mesa Co., has on the ground 500 feet of 6-inch air pipe, 600 feet of T-rails and other supplies. It is expected when this tunnel is completed they will have cut the Old Mesa ledge, which carries free milling gold ore. The Rambler mines, Nos. 1 and 2, of the Old Mesa group, are also being developed.

Work is under way on the Cypress mine, near Big Bug, across the gulch from the Henrietta mine.

ARKANSAS.

Benton County.

A deposit of lead ore is reported found near Gravette.

Boone County.

The prospecting drill for the Almy mine, near Harrison, has been put in operation.——At Harrison N. Watkins is setting up the concentrating mill machinery.

The Red Buck mine of North Boone was sold last week to a company organized at Little Rock. Development work will begin this week.

A piece of pure jack, with but enough rock to hold together, measuring 6 feet long, 2 feet thick and 3 feet wide, was taken out last week from the Silver Hollow zinc mine on the Buffalo river, near Harrison, says the Joplin News-Herald. Its weight is estimated to be 16,704 pounds.

CALIFORNIA.

Amador County.

The Wildman mine, near Sutter Creek, will be reopened Jan. 1, says the Amador Record. The reorganization of the company has been effected and the new incorporation is known as the Wildman Con. Mines, with H. Wilson of San Francisco president. The first work to be done by Superintendent J. Ross will be repairing the Lincoln shaft, followed by running a drift from the Lincoln to the Wildman-Mahoney.

At the Bay State mine, north of Plymouth, the ore chute at the 1050-foot level has been completed, and crosscutting to the Bay State ledge is under way. Power drills are being used. A crosscut is also being run west to strike the west vein or foot wall ledge. This crosscut will have to be run about 400 feet.

T. Mayon has a bond on the Clark gravel mine at Oleta and has men at work.

Calaveras County.

The Nelson Contracting Co. reports its mining operations at Calaveritas progressing. As much of the gravel is hard cement, it is proposed to crush it before washing, and a 10-stamp mill is being built. There are twenty men employed at the mine. To facilitate washing, drifts have been run into the bank and large charges of powder exploded therein to loosen the gravel.

A mob of fifty strikers from the Royal mine at Hodson held up a number of miners being taken from Milton to the Royal mine, marched them down the track a mile and ordered them out of the vicinity. There are 150 strikers in Milton and trouble is expected, say the reports.

El Dorado County.

A 5-stamp mill is being built for the Witmer & Fuller mine, north of Placerville, says the Placerville Democrat.

The Montezuma mine at Nashville has its 10-stamp mill running steadily on ore from below the 300-foot level since the recent rains have given water for power purposes. —— Sinking at the Havillah mine at Nashville continues and the ledge at the 800-foot level is being opened up.

Burger Bros. have bonded the Fort Jim mine near Placerville and will put on men this week. —— N. H. Burger, superintendent of the Fairplay Placer M. Co. on Dry gulch, near Fairplay, says the company has a payroll of thirty hands. A 14-ounce gold bar was produced last week, the result of a test run of 100 cars of gravel.

Kern County.

It is estimated, says the Pacific Oil Reporter, that the production of the Kern river oil field, near Bakersfield, has increased 25% during the present year and that for 1903 it will exceed 16,000,000 barrels. Of this amount the Associated Oil Co. controls 60%. The Southern Pacific and the Standard are the heaviest buyers, and the former is virtually in control of the Associated. The production at McKittrick is estimated at 2,000,000 barrels, which is also about 25% increase. The same conditions provail largely at McKittrick as at Kern river, the railroad company taking a large proportion of the product. The production of Coalinga, Fresno county, has been estimated at 2,000,000 barrels.

Mono County.

The Standard Con. M. Co.'s cyanide plant at Bodie has closed down for the season.

The New Bodie Con. M. Co. continues operation on its group near Bodie. At the Sunshine three shifts are driving the crosscut.——The repairing of the University shaft is completed and the ore body on the lower levels will be opened up, says Superintendent W. H. Netherton.

Monterey County.

Boring for oil has begun near Seaside, 3 miles from Monterey, by B. N. Baker of Baltimore, Md.

Nevada County.

Development work is going ahead at the Gold Canyon mine, on the Middle Yuba river, above Moores Flat, near Grass Valley, says Superintendent F. B. Hill. In the spring development will be increased. The mine is being worked both by shaft and tunnel. The tunnel will cut the shaft.

Work has been resumed at the Old Home Con. mine at Mount Vernon, near Blue Tent, 6 miles from Nevada City, under Superintendent T. T. Kirkham. The hoisting and milling equipment will be overhauled. The property has been idle for three years. A tunnel has been run and an incline sunk from it to a depth of 300 feet.

Enzensperger & Porterfield of Nevada City are reopening the Osceola quartz claim, near Rough and Ready, and cleaning out the tunnel, and when the tunnel is completed they expect to have 400 feet of backs.

A. Naako, owning the Colfax and other quartz claims in Willow Valley, near Nevada City, reports taking out ore which milled $30 per ton. There are two tunnels on the property, one in 600 feet and the other 400 feet. The ore crushed was taken out of the lower tunnel, where the ledge is 4 feet in width.

Superintendent J. H. English of the National mine, near Graniteville, says the mill has been repaired and the stamps are again dropping.

Plumas County.

The Verdi Con. M. Co.'s claims on Mill creek, near Quincy, will be reopened and development increased. M. Splawn is superintendent.

Trinity County.

The California Surety Co. of San Francisco, composed of H. Hume and Smith & Pringle et al., has bought the California group of quartz mines, 2 miles north of Trinity Center, for $5000, says the Redding Searchlight. Development work shows a vein 7 feet in width, which assays $7 per ton.

Tuolumne County.

The Don Pedro G. M. Co., below Chinose Camp, has men at work. The shaft is 140 feet deep and going down at rate of 10 feet per week. When depth of 200 feet is reached a second level will be run northward to connect with the old workings. W. H. McClintock is superintendent.——Three miles west of the Don Pedro mine, at Golden City, N. Williams has men at work on the Oak Hill property (formerly the Olsen mine). He is making regular shipments of ore to reduction works.

The mill of 100 stamps at the Eagle-Shawmut mine, near Chinese, is in full operation, crushing five tons per stamp, says the Independent.

Pumping has been started at the Black Oak mine, near Soulsbyville, preparatory to resuming after being closed on account of trouble over Chinese ore sorters being employed.

Oliver, Deleray & Grant are putting in a Huntington mill at the Little Bonanza mine, near Columbia, which they are operating. The wooden rails in the tunnel have been replaced with T rails. It is intended to run the entire dump through the mill.

A cyanide plant is being put up at the Vine Spring mine of the Yankee Con. Co., near Columbia.

It is reported the Black Oak M. Co.,

owning the Black Oak mine, near Soulsbyville, will be reincorporated under the laws of Wyoming.

At the Mt. Jefferson mine, at Groveland, the 20-stamp mill has been put in operation, and the overhauliug and changes are expected to result in increased capacity. In the east shaft depth of 680 feet has been reached. The pump has been moved from the west to the east shaft and set up at the 500-foot level.

The Sierra G. M. Co., at the Del Monte mine, near Groveland, has men witb teams and scrapers grading for the mill below the hoist.

At the Belle mine, near Tuttletown, the railroad has put in a spur track. Owing to the difficulty of obtaining wood, El Rico M. Co., operating the Belle, has decided to use oil for fuel. Oil tanks are being built and the boiler in the hoist has been fitted with an oil burner.

San Diego County.

The Golden Cross mines at Hedges, which have been in the hands of a receiver for several years, will revert to the owners this month. For several months no mining has been done, the work consisting of operation of a cyanide plant on ore already mined. The product of the mines for the past year is reported to have been $150,000. It is expected mining operations will be resumed in January.

Santa Clara County.

J. Joyce and W. B. Hollaway of Boston, Mass., and Mauager R. B. Harper of the Santa Teresa Quicksilver M. Co., bave honded 200 acres of land south of San Jose, with right to buy for $10,000. They have also an option on ores and mining rights on the J. Borba place of 175 acres adjoining for $5000. The property is said to contain quicksilver deposits.

Reports from Morgan Hill say that gold has been found by C. Seavey ½ mile west of the depot while digging a well. When down 30 feet he is said to have struck rock which contained mineral, samples of which assayed $5 a ton in gold.

Santa Clara County.

At Sargent oil sand was struck last week at depth of 840 feet in the Alberta well. It was "heaving saud" and it rushed up through the pipe, covering the tools, as the pipe is of small diameter. Manager E. R. Snyder says a 16-inch well will be sunk.

Shasta County.

The Redding Land Office last week handed dowu a decision declaring twenty-seven acres of the center of Harrison gulch to be mineral bearing, aud recommended that a mining patent be granted on it as requested, in opposition to the petition of the town for a townsite patent. The townsite people will appeal from the local decisiou to the General Land Office. Bonanza quartz claim, located by E. P. Sherk, F. L. Large and A. Fletcher, extends diagonally across the main portion of the camp. Its surface contains improvements valued at $25,000.

The crosscut tunnel on the Evening Star mine, Old Diggings district, near Redding, is completed and tho main ore shoot openod at depth of 150 feet below other workings iu the mine. The tunnel is 1000 feet in length. The ledge is of quartz 3 feet in width.

Siskiyou County.

A bond on claims at Hamburg has been given to C. Tucker, J. S. Perky, L. L. Rees and B. A. Cardwell of Denver, Colo , for $300,000, and a ditch will be built from Scott river. The banks and bedrock in that section carry pay, but the lack of water permits only a sbort season. With a ditch from Scott river the ground can be worked all year round. The section for 10 miles from the Klamatb river to near where tbe Scott river joins the Klamath will bo made available.

The development work at the McKinley mine on Humbug creek, near Hawkinsville, is progressing, with fifty men employed. Ore is being taken out for the mill, which will be in operation this month.

Yuba County.

The acreage of river bottom land sold and honded along the Yuba river between Marysville and the Parks Bar bridge, 14 miles east of Marysville, exceeds 4600 acres, says thc Marysville Democrat. Payment made last week on the Sunset, Klondike and Gilt Edge claims, near the Parks Bar bridge, insures the dredging of land for gold from a point 1 mile east of Marysville to the bridge. But few tracts considered valuable are unsold.

COLORADO.

Boulder County.

The mill at the Wano mine at Jamestown is in operation. The cyanide process is used. The vein is said to be 40 feet wide, of low grade ore.

The Pennsylvania mill at Culbertson, 4 miles east of Boulder, will be remodeled and converted into a combination lead and pyritic smelter, says tbe Eldora Miner.

Manager Lake of the Boulder County mine, at Cardinal, is putting in an air compressor. This will he used in furnishing power for the 3000-foot tunnel.

Chaffee County.

H. Granfield, president of the Triad G. M. Co., is reopening the company's properties in Trout Creek district, east of Schwanders, near Buena Vista. Sinking from the surface is under way, and when a depth of 50 feet is reached the shaft will he equipped with machinery and sunk to 500 feet. The group consists of four patented claims.

Clear Creek County.

Superintendent W. B. Stewart of the Big Five Ceutral tunnel, near Idaho Springs, is starting work on the new sampler to be built on the south side of Clear creek and near the mouth of the tunnel. This sampler will be followed by a concentrator to be erected by the same company, both to handle the product of the tunnel properties. The track from the tunnel has been extended and timbers for the bridge over the creek and the trestle leading therefrom to the sampler are on the ground. The grade from the bridge to the sampler will be 1 inch per 100 feet. Tbe height of the bridge will be 32 feet, and the ore will be dumped from the mine cars directly into the mill bins.

S. E. Cadwallader has resumed work on his Franklin County mine at Lawson, adjoining the Murray mine, and across the creek from the Commodore power house. The shaft has been sunk 188 feet and three levels run east and west, there being a total of 800 feet of drifting. The mine formerly produced gold and silver ore. The upper levels have been stoped to the surface. The Commodore tunnel at Lawson will cut the Tabor vein.

Development work will be increased on the Santiago group of mines in East Argentine district, near Georgetown, bought by the Hazleton G. M. & M. Co. The group consists of eleven full patented claims, and has produced high-grade gold ore.

After a temporary suspension of three months, operations have heen resumed on the Pueblo mine on Griffith mountain, near Georgetown, owned and operated by the Progressive Eigbt M. Co., composed of Pueblo men. The upper tunnel is in 750 feet, while workings on the lower two are progressing, says Manager Knowlton.

Custer County.

The American Flag mine, near Custer (Rosita P. O.), is nearing the Cuter drift, where a body of ore was left, says the Record. The mine is still pumping considerable water, and it takes eight hours per day to keep it under control.

Men are at work on the Humboldt miue at Rosita, overhauling the machinery. Tbe hoilers have heen repaired, a pump set up and the work of unwatering the mine started. The shaft, which is 800 feet deep, is said to be filled for 125 feet with debris, as the mine has been idle several years.

Fremont County.

The Bluff Springs coal mine, near Florence, tbe difficulties betwcen the owner and the miners having been settled, is again in operation. The starting up of this property leaves but one idle independent mine in Fremont county, says the report.

Coal is reported opened up at tbe Ned Earle mine, 1 mile south of the Chandler mine and 8 miles southwest of Florence. The ground is under lease to C. Cowan. He has been prospecting with a diamond drill for an extension of the Chandler coal vein and struck it at considerable depth, but it proved to he practically worthless at this point. On drilling deeper at depth of 650 feet a 5-foot vein of bituminous coal was cut. The presence of this vein was heretofore unknown. But at 800 feet the drill tapped a 6½-foot vein said to be authracite. Cowan has stopped drilling and will begin sinking a working shaft and will equip the mine with machinery to mine to depth of 1000 feet.

The Union Oil M. & Dev. Co., which owns 480 acres of land 4 miles nortbwest of Florence, and a lease of eigbty acres from the United Oil Co., south of Florence, has begun drilling for oil. L. F. Collins is president.

Gilpin County.

Superinteudent E. Steffan of the Delmonico mine, on Quartz hill, near Central City, has resumed operations, which were stopped on account of the shortage of coal. A new steel cable, 1800 feet long and ⅝-inch thick, has been put on the drum of the hoist, and sinking operations will start this week. The shaft is down 1350 feet and is to be sunk to 1500 feet. Developments will be carried on in the tenth level. The shaft shows a 4-foot vein with 18 inches of chalcopyrite, zinchlende and galena, which carry good values. Louisville, Ky., parties are the operators.

During the last week of November the shipments of smelting and otber ores, tailings and concentrates from the Black Hawk depot to the Denver smelters and to outside points for treatment were fifty-five cars, or 1120 tons, making a total for the month of 199 cars (3980 tons). These shipments were not up to the average, on account of a temporary suspension of shipments at a number of mines on account of the shortage of coal supplies, says the Register-Call. Another reason was stoppage of shipments from the Saratoga properties, where operations have been curtailed at the shaft workings, with a reported view of making connections with the group through the Newhouse tunnel, which will drain it. The coal strike being settled in the Northern coal fields, on which Gilpin couuty is dependent for its coal supply, it is expected shipments will be increased during December.

A gasoline hoisting plant has been put in at tbe Nemeha mine on Bobtail hill, near Central City, says Superinteudent G. MacGregor, and development work will be increased.

A large amount of assessment work is being done around Rollinsville by outsiders, says the Post, believing that the Moffat road will benefit the entire northern section, embracing the territory in and around the Independent, Central, Phœnix, Moon gulch and South Boulder districts. Their remoteness from shipping points has retarded the growth of these districts, but tbe railroad will put them within 3 miles at most of transportation. It is expected tbe road will not reach Rollinsville before spring.

Work is progressing at the mill being built by the Blue Grass M. & M. Co. at Pbœnix, and at same time developmeuts continue under Superintendent R. L. Alexander in the Lone Star mine.

A shaft building and 12 H. P. gasoline engine have been put up on the Diedrick mine in Illinois gulch, in Illinois Central district, uear Central City. The shaft is down 150 feet and will be sunk 100 feet deeper and drifting done. H. E. Coru of Denver is manager.

Sinking operations continue at the Old Town mine, near Russell Gulch, and the shaft has reached the 1300-foot point, showing 4 feet of mineral in the bottom. The lower levels are being opened up. The shaft will go to depth of 2000 feet, provided water troubles do not become too difficult to handle with steam pumps, says Manager G. J. Kimball. He has fifty men at work.

Gunnison County.

The Venango group in Union district, near Pitkin, operated by Manager Halowell, will continue work during the winter. There is considerahlc milling ore on the dumps and in the mines.

At Whitepine the Akron M. Co. is increasing developments. Its Lake Hill tunnel is in 4000 feet and has cut ore on which they are drifting. In the 330-foot shaft a body of ore was cut. The company has been shipping steadily from the North Star shaft and levels. The tunnel has drained these workings of water. The concentrating mill is operating on low-grade ores and it is planned to increase the capacity to 100 tons daily.

Hinsdale County.

C. H. Turney of Smithville, Texas, manager of the Red Gulch and other mines in Park district, near Lake City, says they will sink a shaft on their Cooper Creek group to show extent of the ore body. The ore runs 1 ounce in gold and 150 ounces in silver per ton.

Las Animas County.

A party of five non-union men going from Berwind to Primero, on the 7th inst., were fired upon from ambush on tbe trail, supposedly hy strikers. A pitched battle was also reported on the same day at Seguando, a Colorado Fuel and Iron camp, between thirty striking Italian miners and seven of the company's guards. Three of the strikers were shot and two of them will probably die. Nono of the guards were hurt. The fight occurred at the coke ovens at the cdge of the camp. The miners went to the ovens, but were ordered to stop by the guards. While a number of deputies and clerks were driving from Berwind to Tobasco on the 9th inst. they were fired on by several men hid behind rocks and brush. They returned tbe fire. The sheriff and posse are hunting for the men. Several arrests have been made.

Ouray County.

The Wheel of Fortune mine, in Uncompahgre mining district, is again being worked under bond and lease hy Humphrey Bros. of Ouray. This property is at Bear Creek falls, 2 miles south of Ouray, on the line of the "Circle route" to Silverton via Red mountain. The pay streak averages 1 foot in width and the vein between the walls is 3 feet. It is smelting ore, and the local pyritic smelting plant, north of Ouray, is receiving the output. Considerable stoping ground is reported developed.

The Barstow M. & M. Co. has its mill building, near Ouray, completed, and the machinery is being placed. There are 100 men in the mine and on the surface works. The main output of the mino will be a high-grade product of gold and silver, says Manager J. Geise.——The Treasury Tunnel Co., near the Barstow, is making shipments to the smelters.——Twelve men are at work on the tunnel in the Blowout mine, near Ouray, says Superintendent J. W. Jones, for the Ouray Con. M. Co.——The American-Nettie has resumed under W. C. Wrisberg, president. The mill is running two shifts. The tram from tho mine to the mill has been repaired.

Park County.

Mining movements at Alma are progressing. Ore shipments are keeping up to fall average witb the exception of the London mines, which have had part of their teams hauling timber for winter supply. Preliminary to next season's placer mining at Alma three more reservoirs will be built along the Platte river, covering a distance of 6 miles above the town. This will increase the water supply as well as pressure for the giants of the Snowstorm Hydraulic Co.

San Juan County.

The Ruby Basin M. & T. Co. will build a 100-ton mill next summer and also a 1¼-mile tram line from the mill and mine in the basin to tbe Red Mountain R. R. tracks. The past year's development on the Ruby Basin properties has opened up the ore bodies, and although the main tunnel has not cut the principal veins of the group there is sufficient ore in sight to warrant the mill and transportation facilities planned, says the Silverton Standard.

Machinery has been set up at the Gold Prince mines, near Silverton, and the tunnel is being driven ahead with power drills. Tbe capacity of the compressor is sufficient to run fourteen drills.

P. C. Molan, superintendent of the Eureka Exploratiou Co., near Eureka, reports the main tunnel on the Silver Wing group is going ahead to tap the principal vein, the Denver Belle.

Payment in full was made last week by A. A. Brown for the Picayune group, near Silverton, for $20,000.

San Miguel County

The air compressor for the Badger tunnel at Ophir is on the ground and being set up. A flume for conveying water to keep the jackets of the compressor cool has been built. The bore in the interim is being driven toward the Suffolk and otber veins by hand, says Manager Dolf. It is expected to have the tunnel completed and other development work uuder way before spring.

The electric boist has been set up at the Mayflower group in Bridal Veil basin, near Telluride, and will be put in operation this week. Development on the vein has been slow owing to a horse whim being used. Twenty men are employed, says Manager Davis.

E. S. Platner et al., at the Gold King mine, near Telluride, have a lease on the principal workings of that mine, and twenty stamps in the Gold King mill are dropping steadily during tbe day shift on ore extracted by the lossees. There are twenty-five men at work and an eight-hour shift is in effect.

Judge Wardlaw, at Telluride, on the 7th inst. sustained the motion of the District Attorney to quash the baboas corpus proceedings for release of Secretary-Treasurer O. M. Carpenter and eleven other members of the Miners' Union, who had been committed to jail to answer charges of intimidation and conspiracy. Six of the strikers fined for vagrancy last week left town, and eight who remained were jailed and put to work on the streets in the chain gang to serve for forty days. ——Twenty stamps in tbe Buttorfly mill are dropping ou ore and thirty stamps at the Tomboy are also dropping. More will he operated as more men are put on. At the latter 112 men are employed. The majority of miners arriving daily are from employment agencies in Pueblo, and among them are many Greeks. Some Americans have gone to work, but the majority are foreigners.

Summit County.

Manager J. M. Tbomas reports a reorganization of the Fremont-Vineta Oil & G. M. Co., and the gold mining portion will hereafter be known as the El Dorado G. M. & M. Co. The property consists of a group of fourteen claims, near Breckenridge. They will increase developments and block out ore before erecting a mill, a site for which has been secured on the El Dorado claims, which run down to the county road, near the Swan river. The ore is a partly oxidized auriferous iron, disseminated throughout tbe vein filling; the country rock is slate, interscected by occasional bodies of porphyry.

Teller County.

The Granite mine, on Battle mountain, Cripple Creek district, resumed shipments and is sending out three to four carloads of ore per week with one shift numbering

thirty-five men at work. The ore is coming from several levels and returns of $25 in gold to the ton are received. Seven hundred feet south of the shaft, at a depth of 1000 feet, another ore body has been opened up.

The Cripple Creek Gold Temple M. Co., operating a lease on the Gold Sovereign mine on Bull hill, Cripple Creek, is shipping ore which gives returns of $25 in gold per ton. The ore is being mined at depth of 625 feet from the surface in a drift near the Trilby mine.

The El Paso mine on Beacon hill, Cripple Creek, shipped out during month of November 1000 tons of ore, which gave average returns of $40 in gold per ton. The ore is coming from all of the levels, from the first down to the bottom, or sixth level. In the sixth level, which the drainage tunnel has unwatered, the drift has been extended south on ore for 150 feet and north for 400 feet. Superintendent Bainbridge has 150 men at work. Only two shifts are employed, the management having dispensed with a "graveyard" shift. Few of the larger mines are now employing a "graveyard shift," says the Cripple Creek Times.

The output of Cripple Creek for month of November amounted to $1,299,000, with a total tonnage of 42,600. This is an increase in value of the output over October of $335,000, and an increase in tonnage of 7550 tons. This is the first time since the strike was declared that the ontput has reached $1,000,000. Every mine in the district worked all or a portion of November. The following tabulated figures were obtained from the mills and smelters:

	Tons.	Total Value.
U. S. R. & R. Co	16,000	$400,000
Smelters	5,0 0	300,000
Portland	9,600	288,000
Tellurlde	0,000	150,000
Dorcas	2,500	100,000
Economic	2,000	52,000
Cyanide Mill	1,500	9,000
Totals	42,600	$1,299,000

Governor Peabody has declared martial law in force in Teller county, and details of troops have been stationed in the towns of Altman, Victor, Independence, Goldfield, Anaconda and Cripple Creek. Troops are holding the county jail. Governor Peabody on the 9th inst. issued a proclamation suspending the writ of habeas corpus in the case of Victor Pool, the union miner being held by the military at Cripple Creek, and in whose case Judge Seeds has granted a writ. It is understood the attorneys for the Miners' Union will apply for a writ of habeas corpus to the Supreme Court, and thus test the status of martial law in Cripple Creek district.

Engineer Jaquith measured the flow from the El Paso drainage tunnel last week and found 5000 gallons per minute being discharged through the portal. The east lateral being driven toward the dyke, lying between El Paso and the Elkton Co.'s holdings, is in 1250 feet from shaft No. 2 of the El Paso. The water got to coming in so rapidly through this lateral that the men found it impossible to work. It is 8 to 10 inches deep, says the Cripple Creek Times.

Proclamations were issued on the 9th inst. by Colonel Verdeckberg, in command of the militia, in Cripple Creek district, prohibiting gambling and directing the closing of all saloons at midnight and forbidding the sale of liquor to soldiers.

At Stratton's Independence mine at Cripple Creek, while the daily tonnage is not as large as formerly, the grade is reported to have improved. Screenings have doubled in quantity and the grade of that class of ore has advanced to $60 per ton. Last spring the coarse rock did not run over $15, while now it is averaging $23.

Work on the mill of the Cripple Creek Cyanide Co., near Cripple Creek, is progressing. The foundations are in and the machinery is on the ground. The mill will have capacity of 150 tons per day.

IDAHO.

Ada County.

S. J. Baldwin has bought the tailings dump from the Steen 10-stamp mill at Boise and will put up a cyanide plant with four 15-ton leaching tanks, which will have a capacity of 30 tons per day. Assays of the tailings show an average value of $4.77 per ton, says Baldwin.

Blaine County.

F. Reed of the Liberal M. Co., owning gold-bearing mines in Smoky district, near Hailey, says he is arranging to build a mill on the group. The ore is said to average $12 gold per ton.

The Lipman M. & T. Co. has been incorporated under Arizona laws by F. J. Keisel of Ogden, Utah, and H. M. Wells, M. H. Lipman, F. S. Harris, W. A. Nelden, R. S. Wells, C. E. Hudson and H. J. Dininny of Salt Lake, Utah, to drive the Lipman development tunnel, near Hailey.

Boise County.

Horseshoe Bend reports say a vein of coal has been found at a depth of 200 feet, having been cut by a shaft being sunk.

Lemhi County.

The Lemhi Opal M. Co. has been incorporated to work its opal-bearing deposits near Salmon City. T. Marioneaux of Nephi, Utah, is president, with W. L. Cook, A. H. Birrill, H. M. Wells, J. A. Brown, S. S. King and S. R. Thurman as directors. The deposits will be developed under the superintendency of L. L. Pratt.

Thirty stamps are dropping in the Kittie Burton mill at Ulysses.

Shoshone County.

The American Lead-Silver Supply Co. has been incorporated by J. L. Brice, J. A. Bennington, T. B. Dennis and L. Frankell of Burke, L. Feldman of Murray and J. H. Wourms of Wallace. The mining ground of the company consists of a group of claims near the head of Tributary gulch, on East Eagle creek, 5 miles north of Murray. Development work is under way. The company has a showing of galena carrying silver values.

The Frisco mine, near Gem, has drawn the sinking pumps from the 2000-foot level, but the main pumps on the 1600-foot level are kept working. The property will be sold at sheriff's sale the last of this month.

Washington County.

S. French, superintendent of the Alaska group of mines in Seven Devils district, near Weiser, says he has men at work and will continue operations during the winter.

The Ladd Metals Co. of Portland, Or., which is operating a smelter and several mines at Mineral, near Weiser, and building a smelter at Homestead, Or., last week bought an additional four mining claims at Mineral. The claims are developed by tunnels and shafts. It is intended to operate these mines, which carry values in copper and silver. The Ladd Metals Co. is working 100 men at Mineral.

KANSAS.

Cherokee County.

At Baxter Springs, at the Sunny Side mine, Dilloway & Co. have struck ore in drifting, and a drill hole put down north of the shaft shows ore. They will build a mill at the Sunny Side.

After several weeks of driving the ore body has been opened in the Goodwin-Wagner shaft on the Gaines-Brewster lease at Baxter Springs. The drill showed 20 feet of ore and the shaft has been sunk 15 feet into the ore. Lead is being found with the jack. The drill hole did not show any lead. This shaft is south of the Quapaw Mission. A mill will be built.

MICHIGAN.

November products of lake mines are reported as follows: Adventure (Greenland, Ontonagon county), 95 tons of refined copper; Tamarack M. Co. (Calumet), 600 tons; Wolverine (Koarsarge), 510 tons; Mass (Mass City, Ontonagon county, estimated), 125 tons; Islo Royale (Houghton), 150 tons; Calumet & Hecla (Houghton county, estimated), 3200 tons; Atlantic, (Houghton), 345 tons 845 pounds; Quiucy, (Hancock), 1157 tons 385 pounds; Mohawk (Allouez, Kewcenaw county), 361 tons 1620 pounds. The Mohawk production increased over the previous month despite the burning of a shaft house. The Quincy output was the largest for any month in three years, this being due largely to the showing of the westward end of the property. The stamp mill turned out 1200 tons of mineral, exclusive of the mass copper sent direct to the smelter.

Houghton County.

Houghton reports say at the Atlantic mine, since the discontinuance of rock shipments of the F shaft last July, the mineral yield per ton of rock stamped has made a steady improvement. In August they did not exceed sixteen pounds. In September in one week the amount of mineral returns was a trifle less than twenty-one pounds per ton of rock treated, and during the second week of November rock shipments aggregated 8587 tons, from which there was secured ninety-six tons of mineral, equivalent to 22.31 pounds per ton of rock, or 16½ pounds of refined copper. During the week referred to the yield for one day was eighteen tons for a twenty-four hour mill run. The product for the succeeding week of seventy-seven tons was above the average.

Last week shafts No. 3, 6 and 7 of the Hecla end of the Calumet & Hecla mine, near Calumet, were thrown out of commission by breaking of blocks on hoisting engine. It is not known how long hoisting will be delayed.

The Copper Range Con. Co., at Painesdale, November product amounted to 1906 tons of copper. The three mines produced as follows: Baltic, 622 tons; Champion, 773 tons; Trimountain, 511 tons. The Champion figures are the largest in the history of the mine. The production of the other mines shows a falling off from October.

The Mineral Range Railroad has closed the Arcadian branch and is making shipments from the Franklin and Franklin Junior mines, near Hancock, to the mill at Grosse Pointe, by way of Hancock and the Lake Shore division to Woodside Junction. The Arcadian tracks will be abandoned. The installation of the fourth head at the Franklin mill has been completed. There will be no immediate increase in the amount of rock stamped, as advantage will be taken of new head to overhaul the other three, one at a time. Last lake shipments of copper for season were made on the 2nd inst.

Keweenaw County.

The Allouez mine shaft, near Allouez, is down 200 feet, and the second skip is running. The 3-ton skips that will be used during the development period will be replaced later by a 6-ton skip. It is figured that it will take a year to bottom the shaft in the Kearsarge lode, says the News.

The consolidation of the Miskwabik, Federal and a portion of the Union Land property, near Allouez, Keweenaw county, is expected to be completed by Feb. 1st., placing about 1200 acres of contiguous territory on the Kearsarge lode under one management. The exploratory shaft on the Miskwabik is down 63 feet.

Ontonagon County.

The Michigan mine at Rockland, which began production last month with a single stamp on half time at the Mass mill, is getting a run of masses. One was raised last week weighing 11,000 pounds. While the bulk of the Michigan's production is secured from the Calico amygdaloid, the existence of rich stamp rock and mass copper in the Minnesota contact vein and in the "branch vein" are noticeable factors in the mine's production.

MISSOURI.

The Joplin News-Herald says the highest price reported for zinc ore last week was $35 per ton, and the assay basis ranged from $28 to $32 of 60% zinc, with lead remaining unchanged at $52 per ton. A year ago the highest price for zinc was $36 and for lead $50 per ton. The shutdown of the mines to improve prices is the most general thing of the kind ever inaugurated in the district, 85% to 90% of the production being represented by the agreements reported by the Missouri and Kansas Zinc Miners' Association. Added to those shut down during last week are a number more that will shut down this week.

Benton County.

C. Dahlgren, consulting engineer for the Southwest Zinc Co., and acting manager at the mines at Raymond, says he is estimating for a mill to be built there by the company. He says the company has been losing considerable of the zinc mined, in the present mill, which is not suited to the ore being worked.

Jasper County.

T. R. Nicholas, G. B. McMorrick and J. W. Gray, who have been drilling on the S. G. Norton farm, 14 miles northeast of Carthage, report having struck oil at 85 feet and a heavy flow of water farther down.

At Carl Junction the number of men employed by the Jubilee Co. has been doubled. Sinking has developed a 27-foot face of high-grade jack.——The "A" mill, Ishpeming Co., is grinding out seventy tons of ore per week. Work at the Ishpeming "J" shaft is progressing, and three eight-hour shifts are being worked at the new Ishpeming shaft.

Howell & Lytle have their pumps and other machinery in operation at the L and H mine at Carl Junction.

M. F. and B. M. Robinson and M. S. Robinson have organized the Swastika M. Co. in Joplin.

MONTANA.

The State Legistature has passed two "fair trial" bills, which are now in the hands of the Governor. They were the judicial disqualification bill and the bill providing for a change of venue in civil cases. The Senate bill providing for a review of the facts as well as the law by the Supreme Court was also passed. The only judicial bill yet remaining to be acted upon in the House is the Senate bill providing for the payment of costs where a change of venue is had.

Deer Lodge County.

At the Gold Coin group of mines west of Anaconda, Superintendent J. R. Boarman reports development work progressing and the thirty stamps of the mill are kept running steadily on ores from the Red Fir mine of the group. It is expected the capacity of the mill will be enlarged.

In Warm Springs mining district, 25 miles northwest of Anaconda, a strike is reported made in the Yellow Metal mine, owned by Stagg, Percy & Heffron, of Anaconda. They are running a tunnel and at distance of 250 feet crosscut the lead, showing 4 feet wide, and an average sample assayed $22 per ton in gold. They are also working the Mint, which adjoins the Yellow Metal. They will build a mill next summer.——Adjoining this property is the group owned by Conrad, Smith & Heffron, consisting of three claims—the Lake View, Alpine and Bell. A shaft has been sunk 60 feet on the Lake View, showing a lead 18 inches wide at the bottom, which assays $30 in gold. On the Alpine a cut has been run showing a 3-foot lead and on the Bell a tunnel is being run on the vein, the ore assaying $5 in gold and 3 ounces in silver.——Near these mines the Chicago & Montana group of five claims, owned by Chicago, Ill., and Anaconda parties, is being worked. They have uncovered a 4-foot vein of ore on the Lark assaying $8 in gold. They are preparing to build a 10-stamp mill and cyanide plant.——North of the Chicago & Montana group is the Hannah group, whose Superintendent Savage is working twenty men putting up a sawmill, building roads and excavating for foundation for a cyanide plant.

Fergus County.

Reports from the Justice mine (the Alpino) in Maiden say ore is being opened in the stopes. The Justice is owned by P. W. McAdow. The ore is a lead carbonate, carrying gold values.

Improvements to the roaster of the Gold Reef mill, at Gilt Edge, have increased the ore treating capacity of the plant. Two more plows have been added, permitting the speed to be reduced from 74 to 57 feet per minute, giving more satisfactory results in the roasting, says the Argus.

The Judith M. Co., operating north of the mouth of Spotted Horse canyon, near Lewistown, is preparing for winter work by putting up buildings.

Flathead County.

At Cabinet H. G. Bodich of Libby has bought the Horse Mountain claim and has let a contract for sinking a 50-foot shaft. The Horse Mountain is 2 miles northeast from Cabinet and near the headwaters of Miller creek. It is intended by Bodich to run a tunnel 200 feet after the 50-foot shaft is completed.

Granite County.

The Willow Creek M. Co. has men at work in the Bluebird mine on upper Willow creek, near Phillipsburg. A mill, boiler and engine are on the ground and will be put up in the early spring. Grading for the mill is completed. On account of the heavy snowfall, all outdoor work has been stopped and the men put to work in the mine.

L. Winegar, operating on Willow creek near Phillipsburg, says Ainsley's mill is in operation on ore from Gwin & Winegar's mine, ½ mile distant. J. Ainsley reports having struck ore in his mine near the Ainsley mill on Willow creek. The pay shoot is 15 inches wide and carries free gold.

Madison County.

The Bismarck & Nuggot Gulch M. Co., operating the Toledo mine, near Sheridan, will increase the capacity of its mill from 50 to 150 tons a day. Development is showing up added bodies of ore.

Lewis and Clarke County.

At the North Star mine, near Marysville, owned by T. Cruse of Helena, in the 400-foot level a vein of 7½ feet of shipping ore has been cut. In the 100-foot level another find has been made, consisting of 5 feet of high-grade ore. In the former strike assays from the entire vein run $100 per ton, values being equally distributed between gold and silver. In the other the values are principally in gold. These discoveries are not on the vein that has heretofore been worked and are independent of the main North Star vein.

Silver Bow County.

The Ravon mine in Centerville, near Butte, is expected to begin producing copper-silver ore this month. The owners, C. Mattison and J. Berkin of Butte and W. W. Morris of Pony, have straightened the shaft and added 100 feet to its depth, making it 500 feet in all, and have also opened the vein at the bottom. In doing this work enough ore is being taken out to pay the expense of operation.

NEVADA.

Elko County.

The Dexter Tuscarora mine, near Tuscarora, has closed down for the winter. The management deemed it inexpedient to run the slimes plant during the winter, says Superintendent Archer. A few men will be kept at the mine.

Esmeralda County.

The Gold Mountain Con. M. Co., southwest of Tonopah, has leased a considerable portion of its ground to miners, who have begun sacking ore, which will be sent to the two mills at Tonopah as soon as these are completed, says the Bonanza.

The Tonopah M. Co. at Tonopah is employing 125 miners and is confining operations almost wholly to development work

in the lower levels. The Siehert shaft is down 900 feet and the next station will he cut at the 1000-foot point. The south crosscut on the 700-foot level has made connection with tbe Valley View sbaft, and is 850 feet long. This connection gives ventilation. The four ledges which were cut in the crosscut on the 500-foot level were found in place on the 700, the width and values being maintained. The ores are principally oxidized. A drift is heing run on a ledge 400 feet from the Siehert shaft, the width of the ledge heing 4½ feet, averaging $90 a ton.

B. I. Potter has hought and will work the Wheeler tailings at Pinegrove, hy cyanide process.

Lincoln County.

Manager Perew of the Southern Nevada M. & M. Co. at Searchlight reports work progressing. He says they have a full quota of men at work and are drifting on the lead from the new shaft at a depth of 140 feet. They have tapped it on the 200-foot level of the old shaft and are crosscutting on the 300-foot level.

The Empire M. Co., consisting of Eastern and Los Angeles, Cal., men, is working men on the Badger and Mountain Jewel group of claims (the Flynn mines) in Newberry mountain. The properties are 19 miles from Searchlight and 30 miles from Ibex. The road leading from Ihex, however, heing the much hetter road, all traffic to and from the camp of the Empire Co., supplies, etc., will go in by way of Ihex, with Needles, Cal., the supply point, says the Eye.

The mill on Bamherger's DeLamar mines, at DeLamar, is in full operation. With four Chilian mills in operation, they are crushing au average of 225 tons of ore daily for the leaching tanks. It is the intention of the management to resume work on the Magnolia group, says Superinter dent F. Keith. Meanwhile the main channels in the DeLamar proper and April are being opened up at greater depth with satisfactory results.

The Quartette M. Co., at Searchlight, has resumed sinking with three shifts. ——The three-compartment shaft of the Saturn M. Co. is under way. It is said the company intends sinking to depth of 1000 feet.

At the Good Hope mine, at Searchlight, Manager P. D. Carper says machinery is heing set up and sinking will be hegun in the main shaft. The pump is raising 12,000 gallons of water a day.

Manager O. E. Ellis of the Scoal Gold Reclamation Co., which has heen incorporated to work in El Dorado district, near Searchlight, says the holdings consist of two claims a mile south of the Eagle wash. The lead measures 20 feet wide in places. Development work will he hegun this week. A mill will he built as soon as the showings justify.

The Searchlight, at Searchlight, says that local conditions are improving is shown hy the fact that the freighting outfit, which handles the greater part of the freight and passenger traffic, has fifty-six animals on the road, and in January will put on three ten-animal teams.

At Calientes the principal mines in operation are the Keystone, Douhle Up, Forty-nine and the Mormon mine. At the Keystone fifty men are at work and ore which carries gold is heing mined, which is milled at Sandy. Near this mine is the Cinnahar mine, where quicksilver is being ohtained, as well as some gold. The Mormon mine is under hond to J. M. Kennelly, who is preparing to work it. South of this mine are the Douhle Up and Forty-nine mines, from hoth of which gold ore is being extracted.

Nye County.

The Tonopah Utica M. Co., which owns a group of three claims adjoining the Liherty mine on the north, is opening up its group, says C. F. Maunder, manager.

The Dolores Turquoise M. Co. has heen incorporated to work the turquoise prospects at Ray, north of Tonopah. The officers are A. & M. H. Kunze, J. C. Conklin, E. E. Kunze and A. Conklin. J. C. Conklin is manager.

Storey County.

Drill hole No. 6 on the Brunswick lode, at Virginia City, has reached depth of 425 feet, with the hottom in porphyry and quartz stringers.

Washoe County.

A 3-stamp mill and accessories are on the ground for E. Olinghouse at Olinghouse canyon, near Wadsworth. Thero are $15,000 worth of gold ore on the dump ready for crushing.

The prospecting drill heing used by the Springfield Nevada M. Co. is in operation on hore hole at mill No. 1, and is making 17 feet per day. The mill is heing put in order.——Nelson & Effrick's lease on the No. 1 is reported improving. Thirty-four tons of ore taken out in development have heen milled, yielding $20 per ton.

White Pine County.

H. A. Jackson, superintendent of the Rocco-Homestake mine at Hamilton, says machinery is on the ground for the hoisting plant. The gallows-frame is going up.

NEW MEXICO.

Bernalillo County.

The Peralto Canyon Con. G. M. Co. has heen incorporated, with principal place of business at Alhuquerque. Incorporators are D. C. Dunlap of Alhuquerque, P. A. Young of Chicago, Ill., and C. Sheldon of Milwaukee, Wis.

Grant County.

The American Con. M. Co., with headquarters at Amizet, near Twining, hut which is working prospects in Long's canyon at Gold Hill, has increased its number of men at work.

Lincoln County.

The Riaeto M. & R. Co. has been incorporated at Parsons.

The Bonito M. & R. Co., with principal offices at Parsons, has heen incorporated hy G. L. Gihson, T. B. Grist and R. C. Dryden of Parsons and Chicago, Ill., men.

Otero County.

The turquoise mines at Jarilla have been leased hy the Electric M. & M. Co., and operations will begin this week. Machinery has heen put in and horing for water started, says G. J. Moffett, manager.

Santa Fe County.

T. Neis reports locating a 3-foot coal vein in his mine near Cerrillos, the vein showing 3 feet wide at depth of 75 feet.

Sierra County.

The Bigelow G. & C. M. Co. is sbipping ore from the Mamie Richmond mine at Hillshoro. The company proposes to hlock out 50,000 to 100,000 tons of ore hefore putting up a treatment plant.

Taos County.

The Fraser Mountain C. Co. has its smelter at Twining in operation. More men will he put on at its mines.

OREGON.

Baker County.

The Pulaski G. M. & M. Co. will resume work on the Pulaski mine by Jan. 1st. The crosscut will he driven ahead to the main lead and drifts run hoth ways on the ledge. The company has nine well-timhered claims, with ample water supply, near Sumpter, on the line of tbe projected railroad to Bourne.

Superintendent A. Otness of the Gipsy King mine, in Cahle Cove district, near Sumpter, reports development work under way. He is drifting on tbe vein that has heen cut on the Bull creek side of the divide. The face of tbe tunnel is in porphyry. The company owns seven claims, reaching from Big Timher to Bull creek.

It is expected the Golden Wizard mill, near Sumpter, will be completed next month, says Superintendent McPhee.

Douglas County.

E. Wood of Spokane, Wash., superintendent of the Crystal Con. M. Co., says work is under way on their stamp mill being built near Bohemia. There are thirty men at work.

Grant County.

J. W. Messner, superintendent of the Prairie Diggings mines, near Prairie City, says that at the Mars group of copper claims a hoist is heing set up with depth capacity of 500 feet. Work at the Prairie Diggings is progressing. The shaft is down 200 feet and the main lead is expected to he cut in the next 100 feet. Messner will start the mill in January.

P. A. Brady, superintendent of the Belcher, near Granite, says work will hegin on tbe 20-stamp mill to he huilt at the mine, next week. It is expected to he put in operation in the spring. A raise is heing made from the lower to the upper workings a distance of 150 feet, and other development work done. Brady states progress is heing made on the Red Lion mine, of which he is also superintendent. The vein has heen cut on the lower tunnel showing width of 30 feet, with a 6-foot pay streak assaying $7. A mill will he put in.

SOUTH DAKOTA.

Lawrence County.

The Golden Crest M. Co. is running its 10-stamp cyanide mill, near the head of Two Bit creek, near Galena, near the Branch Mint ground. The capacity of the mill has heen doubled.

On Ruhy gulch, near Galena, the Ruhy G. M. & M. Co. is huilding a mill of fifty tons daily capacity, which will be ready for operation in Marcb. The mine is opened up, showing free milling and concentrating ore. J. Conzett of Deadwood is manager.

TEXAS.

Limestone County.

Oil is reported struck at Big Hill, 250 miles southwest of Beaumont, and a rush is on to the district. The wells are on the line of the Cane Belt railroad. A gusher was struck last week, and the owners capped the well, but it hroke loose, and is said to be gushing at the rate of 5000 harrels daily.

UTAH.

The ore settlements for the month of November were $1,718,500, as against $2,125,393 for Octoher. This does not include the value of over 3,000,000 pounds of matte, containing gold, silver and copper, from the independent smelting plants of tbe State. Figures on the value of the matte from the independent smelters are not obtainahle, except in tbe case of the Majestic, which has made $20,000. The output of the smelters for the month is given as follows in pounds:

Bingham Con	728,292
Highland Boy	1,103,636
United States	788,413
Majestic	380,000
Total	3,000,341

The output of tbe independent plants in Octoher was 2,656,200 pounds. The increase is due to the hlowing in of the Majestic smelting plant at Milford.

Beaver County.

W. J. Bowring of Salt Lake City, who has a hond and lease on the Copper Mountain group, near Milford, has put men to work on development.

W. A. Wilson, manager of the Sheep Rock mine, near Milford, says they are drifting on the vein on the 300-foot level, and it is intended to put in a gasoline hoist and sink 300 feet more.

The pipe line between Wah Wah Springs and tbe Newhouse smelter site, near Frisco, was completed last week and bas heen tested. In construction of this line, by which tbe town, the mines and reduction works will be supplied with water, 44,000 feet of pipe has heen used. Construction of the main reservoir at camp has hegun, says Superintendent J. Dederichs.

R. M. Pope of Salt Lake City, manager, says the American M. & Rare Metals Co. of Utah has heen incorporated, and has gained control of the Letitia group of claims near the Old Hickory mine, near Milford. This group consists of six claims. It is intended to increase development work. The ore carries values in copper and silver. Several shafts have been sunk and will he deepened and drifts run on the ore. The company also owns a numher of asphalt and gilsonite-hearing claims in eastern Utah. A vein of ozokorite in Grand county will be developed.

Box Elder County.

Work on the group of the Sunrise M. Co. at Park Valley is progressing, says Manager S. Simon. A mill will he built, which will have five stamps to start with. The ore carries gold values.

Work is under way on the Little Jimmy group of claims at Park Valley, owned by McCarrick, Page et al.

Carbon County.

Vice-President Kramer of the Utah Fuel Co. says they are securing Americans to work in the mines whenever possible. "The worst is over and the mines will be kept open." More men are being put on daily.

Garfield County.

The Clawson G. M. Co. has heen formed at Ephraim, to operate in the Henry Mountain mining district, west of Hite.

Grand County.

Work will he started up this week on the Beaver Basin group, near Basin, hy the Dirigo-La Sal M. Co. The merger of Beaver Basin and Deep Creek interests is settled. The Dirigo-La Sal Co. owns a comhined area of 600 acres of mineral land on the northeast slope of the range. Reduction works will he huilt.

The cyanide mill at the Inter-State Co. property in Gold basin, near Basin, is nearing completion and will he ready for operation next week. —— The Grouse Mountain M. Co., operating in Miners' hasin, has put in additional equipment, will increase its force to three shifts and drive the tunnel ahead to cut the vein. They have 150 feet to run before cutting the Mayday vein. This company is preparing to put in a 100-ton cyanide plant.

Iron County.

The Utah-Montana M. & M. Co. of Salt Lake City is heginning development work on its group in Indian Peak district, 16 miles north of Stateline.

It is reported G. P. Smith, superintendent of the Shawmut mines at Fay, Nev., has a hond and lease on the Amethyst and Wild Irish claims, south of Stateline, near the Nevada line. Smith also has a hond on the Snowflake in tbe same section, calling for $50,000. These claims are in a gold district and adjoin the Independence.

Juab County.

D. A. Depue of Rohinson and H. Joseph, manager of the Carisa, have a lease on the Sioux-Utah group, near Eureka, and have hegun stoping operations. The Sioux-Utah group was a former producer of Tintic district. Arrangements have heen made with the smelters for shipments.

Novemher shipments from Tintic district were as follows:

	Cars.
Bullion-Beck	24
Carisa	27
Centennial-Eureka	159
Gemini	31
Grand Central	78
Lower Mammoth	50
Swansea	15
South Swansea	18
Tetro	10
Yankee Con	12
Eleven others, total of	25
Total	449
May Day (concentrates)	3
Iron Ores—	Cars.
Black Jack	22
Dragon Iron Mine	102

Salt Lake County.

Manager L. C. Snyder of the Iowa mine at Bingham, says operations were resumed last week. The Iowa group is near the Red Wing, Julia Dean and Red Wing Extension, and consists of nine claims along the Montezuma vein.

The tracks of the Copper Belt railway at Bingham have been laid to the ore bins at the Yampa group of mines, says Manager W. Bayly, Jr., and the forwarding of ore over them has hegun. The Yampa has heen hauling hy team forty tons of ore daily to the furnaces of the Bingham Con. M. Co. As the contract with the Bingham Con. accords the Yampa the privilege of delivering to it 300,000 tons, it is expected the output will he increased to 200 tons a day. —— The spur to the Columhia group of mines, operated hy the Ohio C. Co., will be completed this week, when the furnaces of the United States M. Co. will get fifty tons daily from that source pending remodeling of the Winnemuck mill, which will he operated by the Ohio Co. Rail connection witb the Boston Con. ore hins are expected next week.

Last week the main fissure of the Erie mine at Bingham was cut hy the drift from Mystic Shrine tunnel and is sbowing 3 feet of smelting ore that assays 45% iron (low in silica), 4½% copper, 14 ounces silver and $2.80 in gold. The Erie is heing operated under hond and lease hy J. W. Cairns & Co.

The valley furnaces during the month of Novemher handled a total of 90,000 tons of ore, distrihuted as follows:

	Tons.
American S. & R.	37,000
United States M. Co.	24,000
Highland Boy	15,000
Bingham Con.	14,000
Total	90,000

The Bingham Con. had hut three of its furnacos in operation, hut with the increased tonnage from the Yampa and witb Boston Con. as a producer the present month will requiro the fourth to he put in commission.

The Harker M. Co., recently formed, has started operations in Skull valley, near Salt Lake City. A winze is heing sunk from the tunnel level on a vein of silver-bearing ore, which shows surface assays of $5 per ton. D. Harman is manager.

The management of the Bingham Con. smelter at Bingham is figuring with the railroads and the Eastern coal companies on the cost of importing Pennsylvania coke, says the Trihune. The railroads have made an arbitrary rate of $6.50 from Duluth, West Superior and Chicago, and the coking companies will sell the fuel, f. o. h. ovens, at $1.75 per ton. What remains to he ascertained is the cost of lake and railroad transportation hetween Pennsylvania and Duluth, Chicago and West Superior. The smelter has heen paying $10 per ton for Montana coke. It is thought the rate made by the Western roads will he revoked when the Utah Fuel Co. is in position to supply the local demand.

Work on the concentrator of the Utah C. Co. at Bingham is progressing. The iron for inclosing the huilding is on the ground, and as soon as this is up placing the machinery will he started. The working tunnel through which the ore is to be mined is well under way and the air line from the United States is nearing completion, which will enahle starting tbe drills.

Sevier County.

The Clawson G. M. Co. of Ephraim, Sanpete county, has been incorporated hy J. A. Clawson, J. A. Anderson & A. C. Bosen. The company owns the Grand Central, Pacific, Alice, Dewey, Admiral and J. A. C. claims in the old Henry district of Sevier county.

Summit County.

The contemplated improvements at the Liherty mine are to he postponed until spring owing to delays occasioned hy the carpenters' strike. It has beon the plan of the company to install a system of modern machinery, including power drills to drive their 2700-foot tunnel, hut this winter this work will be done by hand. Nothing is expected until the tun-

nel has advanced 600 or 700 feet, although several small fissures have already been crossed. Six hundred feet of tunnel ought to place them in the mineralized zone opened above.

At the Naildriver mine, at Park City, the drift from the shaft to the tunnel has been completed, opening up an air passage as well as providing means of escape in case of accident. It is intended to sink the shaft to the 700-foot level before crosscutting. The shaft is down 670 feet and work is progressing through a limestone belt. Considerable water has been struck. —— Superintendent Hickey of the Comstock mine has men cutting a station on the 450-foot level and will crosscut to the vein. It was intended to sink another 100 feet before the station was cut, but this could not be done on account of the water. Hickey expects to get the shaft down to the 550-foot level before spring.

Manager Turner of the J. I. C. mine of Park City says the shaft is down 650 feet, and is being driven at rate of 2 feet per day.——The steam plant of the Diamond-Nimrod mine at Park City started up last week, and a 1000-foot shaft will be sunk. This company holds the undeveloped ground near the Silver King, Daly-West and Ontario.

Tooele County.

The Honorine tunnel at Stockton, running through the Black Diamond ground, has tapped a ledge with a width 50 feet between walls, and to prospect it Manager J. Dederichs will begin work as soon as Superintendent Raddatz of the Honorine M. Co. gives him permission. Meanwhile he is working the ledge from the upper levels.

Utah County.

The Dutchman M. Co. has been incorporated, with American Fork as principal place of business. The company owns the Wild Dutchman and nine other claims in American Fork canyon. The directors are: W. G. Andrews, W. J. Holdon and F. S. Many of Cleveland, Ohio, and W. A. Madison and H. J. Kruse of American Fork. W. A. Madison is superintendent.

The Colton Wax M. & Oil Co. has bought the Colton wax mines No. 8, near Colton.

WASHINGTON.

Ferry County.

During month of November 152 carloads of ore were shipped from the mines of Republic camp, amounting to 5320 tons, valued at $95,706. The Quilp mine shipped 48 cars and the Mountain Lion 65 cars. The others were shipped from the Nob Hill, Morning Glory, Trade Dollar and Zala M. mines.

WYOMING.

Carbon County.

The directors of the North American C. Co., including W. G. Emerson and J. Carey of Denver, Colo., propose to spend an additional $250,000 for improvements in the equipment of the company at Encampment, says the Times. Their plants were closed down last week, throwing 500 men out of employment, the cause being necessity for repairs in the 16-mile aerial tramway and in the smelting plants. The improvements will include alterations in the reduction works and added development of the Ferris-Haggerty mine, including a complete system of underground compressed air railroads. These improvements will occupy the winter and the mine and works will be reopened in the spring.

FOREIGN.

AFRICA.

Transvaal.

The discovery of diamond bearing ground is reported at Jacobsdal. Twenty-two shafts have been sunk over a distance of 140 feet, in each case showing rich yellow ground, and blue ground at a depth of 40 feet.

BRITISH COLUMBIA.

Boundary District.

Shipments from the Boundary mines for the month of November amounted to 74,431 tons, against 73,256 tons for October. Shipments for the year to the last of Novemher were as follows:

Mines.	Tons.
Granby	336,417
Mother Lode	117,884
Snowshoe	70,252
Emma	19,650
B. C.	19,365
Sunset	15,521
Oro Denoro	12,766
Athelstan	4,156
Morrison	3,339
Winnipek	2,435
Providence	910
Elkhorn	213
Total	602,814

East Kootenay District.

At Perry creek, near Fort Steele, the Theis M. Co. is sinking a shaft to reach bedrock.——It is planned by the Kootenay Perry G. M. Co. to continue exploratory operations on their holdings all winter. A cable tramway is being extended from the wagon road to camp, to be used in transportation of supplies and machinery.——Several Chinese outfits which have been working in the bed of Wild Horse creek the past summer are reported to have made an average of $5 per day per man.

One hundred and fifty coke ovens are in operation at the Crow's Nest Pass Coal Co.'s mines at Morrissey. The remaining 100 will be completed in the spring, as construction work has stopped for the season, owing to unfavorable weather.

H. H. Shallenberger will work the Moreen claim, in South Deadwood camp, this winter. It adjoins the Buckhorn claim and is said to have a 60-foot ledge, with copper values.

Rossland District.

Shipments from Rossland camp for the month of November aggregated 38,576 tons, against 38,151 for October. Shipments for the year to the last of November were as follows:

Mines.	Tons.
Le Roi	197,045
Centre Star	72,556
War Eagle	54,168
Le Roi No. 2	24,115
Le Roi No. 2 (milled)	1,400
Jumbo	3,593
Spitzee	120
I X L (milled)	1,750
Kootenay	6,798
Giant	830
Iron Horse	40
Velvet	3,376
White Bear	297
O. K	25
Homestake	90
Total	367,140

P. H. Craven and G. Pringle have another lease from the I X L M. Co. at Rossland, this new agreement covering the mine itself, as heretofore the lessees have only had rights on the dump. Development work will be increased and the product of mine and dumps will be milled at the O. K. stamp mill. Alterations will be made in connection with the water system at the mill. The pipes conveying the water to the plant will be protected from the frost and the exhaust from the engine will be run through the tank inside the mill for raising the temperature.

The White Bear M. Co., at Rossland, is arranging to build a plant to use the oil process. It is understood the company will have a fifty-ton plant as a starter, with arrangements for increasing the capacity. Tests of White Bear ore have been made with the process. The company has a millsite and water records staked between Rossland and Trail on the line of the Canadian Pacific railway.

It is reported work will be resumed at the Monte Cristo mine, near Rossland, controlled by Montreal men. The Monte Cristo possesses reserves of ore, says the Rossland Miner, that were too low grade to be operated profitably four years ago, when the mine suspended work. The ore can be brought out by horizontal workings, and the mine drains itself. The Monte Cristo Con. M. & Dev. Co. owns the Monte Cristo and Buckeye No. 2 claims on west slope of Monte Cristo mountain. The Canadian Pacific railway runs through the lower end of the claims. Development on the group consists of 5166 feet of work, and the maximum depth on the vein 600 feet. Three tunnels are driven on the ledge, one 1100 feet in length, another 515 feet and a third 550 feet. The equipment includes a seven-drill compressor, 80 H. P. boilers and 20 H. P. hoist.

Manager E. B. Kirby of the Centre Star mine at Rossland, in his annual report, says the serious obstacle presented to large scale milling by the so-called 2% tax imposed by the British Columbia Government on the gross product of mines has not yet been removed. This tax has the effect of exacting an increasing proportion of the net profits as the grade of ore lowers. On the milling grades of the Centre Star (which are increasing in quantity with decrease of smelting ores) and other Rossland mines it will take from 10% to 20% of the net profits. The effect of this tax in repressing the mining and milling of low-grade ores throughout the province has forced the mining communities to join in active measures for its repeal, and the matter is being pressed by the Provincial Mining Association. A preliminary mill of 200 tons daily capacity, but designed for enlargement to 400 tons, is being built by the Rossland Power Co., Ltd., on the line of the Canadian Pacific Railway, near Trail. It is expected to begin operations by spring, affording outlet for the milling ores of the Centre Star and War Eagle mines. The costs of mining are as follows: Winzes, $38.77 per foot; raises, $29.97 per foot; drifts, $17.09 per foot; mining ore from stopes, $2.07 per ton. The entire cost of mining and delivering ore on the cars, including its pro rata of general expenses, was $2.07 per ton of ore from the stopes, and during several months ranged between $1.93 and $1.96. Including the additional ore broken by development headings, the average for the year was $1.97. The details of the mine costs for the twelve months ending September 30, 1903, are shown in the following table:

	Development work.			Ore extraction.
	Sinking small shafts.	Raising.	Drifting.	
Total advance, feet	79	186	2,903.5	
Ore stoped, tons				84,453

	Cost per foot.			Cost per ton.
1. Drilling	$6 10	$7 31	$1 53	$0 405
2. Blasting	2 48	3 40	1 08	030
3. Explosives	3 13	3.72	2 72	.145
4. General mine supplies	51	.64	43	040
5. Mine lighting—candles	.26	.19	.14	.015
6. Mine lighting—electric	.30	.22	13	.010
7. Smithing	1 00	1.14	72	.065
8. Tramming and shoveling, direct	5.51	.65	1 21	.240
9. Tramming and shoveling, apportioned	.64	.35	42	.085
10. Timbering—labor	1.81	3.08	.02	.190
11. Timbering—material	.33	.57	.01	.110
12. Machine drill fittings and repairs	.86	.94	.60	.055
13. General mine labor	1.57	1.18	.84	.060
14. Hoisting—underground	4.79			
15. Hoisting—main shaft	1 48	.89	.94	.190
16. Compressed air	1.74	2 08	1.07	.120
17. Mine ventilation	.23	.17	13	.015
18. Pumping	1.71	1 09	.34	.035
19. Assaying	.65	.47	.14	.030
20. Surveying	.20	.17	.11	.010
21. General expense	3.57	2 71	1.51	.185
Totals	$38 87	$29.97	$17.09	$2 065

Slocan.

The Alamo concentrator, near Sandon, which is being remodeled, is expected to be ready for operation by Jan. 1. At the mine development continues and several cars of ore have been shipped from the veins opened up. The Idaho, Manager Jenkins, is preparing to increase operations.

The Payne mine, at Sandon, shipped several tons of iron extracted from the zinc by the electric magnetizer to the smelter last week. It is used for fluxing. The saving of the iron ore means another source of revenue to the Payne, from material which until recently was thrown over the dump as waste.

H. A. Harris has taken a lease on the Charleston group at Whitewater. Ore has been opened up.

Vancouver Island.

The Dunsmuir Colliery Co. of Comox was last week convicted on seventy-six separate charges of employing Chinese in their coal mines, contrary to law. Fines aggregating $2000 were imposed. Unless all the Chinese miners are removed from the mines, it is said the Government will proceed with another 100 cases.

West Kootenay District.

The Alma group, on Pool creek, 5 miles from Camborne, has been bought by C. McCrossan of Los Angeles, Cal.

Pipe laying for the Oyster-Criterion stamp mill power line, near Ferguson, is progressing, and as soon as this is completed the mill will start, all interior arrangements being completed.

By the sale of the Alpha group, on Great Northern hill, in the Lardeau, near Ferguson, the Horne-Payne Co. winds up its mining business in British Columbia.

MEXICO.

Chihuahua.

At the Cigarrero mine, in the Almoloya mountains, 3 miles from Troya station on the Mexican Central Railroad, a 230-foot crosscut on the 300-foot level has opened up a body of lead carbonate running 32% lead, sixteen ounces silver and three ounces gold per ton. The company is shipping seventy-five tons of this ore per day.

L. Reed, manager of the Sahuayacan M. Co., in district of Rayon, 40 miles west of El Campo and 140 miles from Minaca, says the company has a 20-stamp mill on the property, which consists of twenty-four pertenencias, but the mill is not running at present while development work underground is being increased.

G. McManus and Sr. Urueta, operating at Cusihuiriachic, have their 10-ton smelter ready for operation, but have been delayed in accumulating a sufficient quantity of lead ores for fluxing purposes. McManus expects to blow in this month.

W. A. Stuart, of El Paso, Texas, has an option on the Oaxaca group of gold mines for $100,000 gold, says the Chihuahua Enterprise. The properties are 70 miles east of Chihuahua in the Placer de Guadalupe, and near the Orient railroad being built. The road will run within 2½ miles of the mines, but the present terminus, Las Trancas, is 30 miles distant. An 8-stamp mill is on the ground which is also included in the deal.

H. E. Cary of Salt Lake City, Utah, part owner of the Lluvia de Oro mine, near Urique, says he is arranging to put up an additional 20-stamp mill. The ore is mainly free milling, but concentrating tables are also to be put in. A 2-mile tramway will he put in from the mine to the Fuerte river. A. J. Underwood is manager, and development continues with the present mill in full operation.

Durango.

The La Cong mine, near Inde, owned and operated by E. Avila and W. S. Benton, is said to be shipping 200 tons per month of ore which runs 1000 ounces silver, 10% lead and 0.3 ounce gold to the ton. The Portillo, owned and operated by W. Petit of Parral, is also shipping 200 tons of ore per month, the ore carrying 150 ounces of silver per ton.

The Cia. de Oro de Guarisamey has been organized in Durango to develop a group of mines at Guarisamey in San Dimas district, northwest from Durango.

Guerrero.

Men are at work developing the Guerrero del Oro group, near San Nicolas del Oro. The ore carries gold values. W. Niven is manager.

Jalisco.

The Negales mine has been bought by G. N. Van Horn of El Paso, Texas, for $27,000 gold. This property is 40 kilometers west of Guadalajara. Van Horn will place machinery and start development work.

Mexico.

The Esperanza mine, at El Oro, has a 200 H. P. direct-connected flat-cable double hoist in use at the south or main shaft. The cages are two-compartment (upper and lower), and at each lift the hoist brings up two loaded cars. It is said to be the only flat-cable hoist in El Oro, Tlalpujahua district.

Michoacan.

The Perseo mines, consisting of thirty pertenencias, 4 kilometers northwest from Tlalpujahua, are equipped with single steam hoist, one pump and two boilers. A two compartment shaft is being sunk 160 feet, says Manager W. H. Case.

The Reforma mine, near Tlalpujahua, owned and operated by the Reforma M. Syndicate, Ltd., of Manchester, England, is being developed through a three-compartment vertical shaft which is down 690 feet, and sinking is progressing through the andesite capping. It is expected the black slate will be cut within the next 50 to 100 feet. The equipment consists of double steam hoist, three pumps, three boilers, buildings, etc., says Manager E. C. Hugon.

At the Venus mine, at Tlalpujahua, the hoist and boilers are being set up and sinking of the three-compartment vertical shaft, down 90 feet, will be resumed, says Manager V. P. de Alva.

At the Luz de Borda mine the grinding mill is expected to be crushing ore this month. The fifteen stamps are dropping regularly and 600 tons of ore per month are being treated. B. von Steinaecker is superintendent.

Nuevo Leon.

The Mexican Journal of Commerce says the steel plant at Monterey is in operation and turning out 350 tons of steel daily. The output of the plant is confined to structural steel and steel rails. Large orders for rails have been placed by several of the railroads of Mexico. One thousand men are employed, and in additfon the company gives work to over 2000 men at the iron and coal mines from which the supplies for the plant are drawn. The iron mines are near Golondrinas, and the coal mines are in the northern portion of the State of Coahuila. When the steel plant is in full operation and the iron and coal mines developed to meet the increased demand, the industry is expected to give employment to 5000 men. Vicente Ferrara is president of the company.

San Luis Potosi.

Construction work on the Matehuala smelter will be begun this month by the National Metal Co. of Matehuala. A

brick-making plant will be put in. The making of its own brick will save the company $100,000, says J. A. Kilton of New York, manager in charge at Matehuala.

Unwatering of the Tiro General mine, near Charcas, is progressing, and the company is shipping 500 tons of ore weekly from the dumps. A steam hoist has been set up on the Trinidad mine, adjoining the Tiro General.

Sonora.

The Cananea Herald says operations bave resumed at the Sierra de Cobre mines (the Indiana), near Cananea, and 400 miners will be put to work. F. L. Harrington is superintendent. The mines are owned by the Copper Queen C. Co. of Bisbee, Ariz.

The Providencia M. Co. at Cerro Blanco, near the Sonora railway, is shipping ore.

At La Verde, near Cumpas, in Moctezuma district, the Transvaal C. M. Co., composed of Cincinnati, Ohio, men, is increasing development work. The company is devoloping four copper mines—the Transvaal, Cobre Rico, Buckeye and Piedra Verde—and also two silver-lead mines. At El Padre, in the Sierra Madres, 15 miles east of Cumpas, the company has five gold prospects. At the mines O. L. Neer is superintendent, with C. L. Rogers assistant superintendent and chemist.

The Cienegita M. Co., of which G. Bebee is president, owning copper mines on the Yaqui river, 150 miles east of Hermosillo, proposes to build a railroad from Minas Prietas to their property, a distanco of 100 miles. Tbey will build a smelter. There is a branch line from Torres station to Minas Prietas, which is used by the mining company at Minas Prietas, and it is proposed to secure a traffic agreement with that company.

In the mineral belt of Chirunibabi, in Moctezuma district, on Nacozari creek, about 2 miles from Nacozari, the Dona Maria mines, being the Alaska and Julia Blanca, have been sold to the Sonora Development Co., which is operating other properties in Moctezuma district.

Tepic.

The Buena Vista y Anexas group, consisting of 300 pertenencias, is 1¼ miles north from La Yesca, in the district of Ahuacatlan, and is ownod and operatod by the Buena Vista y Anexas M. Co., J. M. Stark, superintendent. Development consists of two single comparment vertical shafts, 300 and 600 feet respoctively in depth, two tunnels respectively 150 and 1200 feet in leugtb, and several hundred feet of crosscuts, drifts, etc. Thore aro one 5-roll mill, two ongines, four boilers, four air compressors and a 70-ton cyanide plant on the group. To this equipment tho company expects to add ten Huntington mills, four concentrators, two additional rolls for the mill, and it also proposos increasing the cyanido plant to treat 120 tons per day. Thore are also two wire rope tramways on tho property, one 2300 foct long for carrying ore from the mine to the mill, and oue 4920 feet long for transporting wood to the furnaces. The company is mining 3000 tons of oro per month, and has 1000 men employed, says the Mexican Iuvestor.

Books Received.

"Ore Dressing," by Robert H. Richards, S. B., is tbe title of a monograph on the mauipulation and concentration of ores, just issued from the press. It is bound in two volumes, 1236+XXIX pages, with 560 illustrations and sketches. This is the most comprehensive work that has ever been issued on the subject of concentrating ores, and it deals with the important and interesting subject in a thorough manner. The work contains twenty-one chapters, besides an appendix, in which is found numerous valuable tables. The work is divided into four parts, as follows: Part I, breaking, crushing and comminuting; Part II, separating, concentrating or washing; Part III, accessory apparatus; Part IV, mill processes and management. Each part is subdivided into several chapters, in which each division is again divided under several heads, and oach subject treated in a thorough manner. There are a number of new ideas in the arrangement of the book, wherein by a system of abbreviation much space is saved, bringing the volumes to a normal size convonient to handle. The illustrations are carefully mado, in many instances giving dimensions, so that, if desirable, they may be used for working plans. Numerous mills throughout tho world aro described, together with tho process of ore treatment, these practical oxamples giving the work greater value. The Engineering and Mining Journal, Now York and Loudon. Price, cloth, $10.

Personal.

P. H. BARKER of Denver, Colo., is in San Francisco, Cal.

G. K. ARCHER of Butte, Mont., is in the State of Jalisco, Mexico, examining mines.

R. D. CULBERT of Amador City, Cal., is in San Francisco, Cal., on mining business.

W. H. COUCH is manager of the Belden mine in Chase gulcb, near Central City, Colo.

E. T. BROCKMAN of Pittsburg, Pa., interested in Idaho mines, is in San Francisco, Cal.

L. D. SIVYER, M. E., of Spokane, Wash., is examining copper properties at Globe, Ariz.

JOHN EDDIE is general superintendent of the mines of the Champion M. Co. near Nevada City, Cal.

W. Y. WILLIAMS, superintendent of the Granby mines at Phœnix, B. C., is visiting in Minnesota.

E. WOOD of Spokane, Wash., is superintendent of the Crystal Con. M. Co., at Bohemia, Douglas Co., Or.

W. MAGUIRE of Dutch Flat, Placer county, Cal., interested in Placer county mines, is in San Francisco, Cal.

H. W. TURNER, E. M., of San Francisco, Cal., has removed his offices to No. 14 Sansome street, San Francisco.

L. C. STODDARD of New Haven, Conn., interested in Utah properties, has returned from a trip to Salt Lake City, Utah.

P. C. MOLAN is superintendent of the Eureka Exploration Co., operating the Silver Wing mines, near Eureka, Colo.

M. L. REQUA, mine owner and president of the Pacific Stoel & Wire Co. of San Francisco, Cal., is in Denver, Colo.

H. V. CROLL, Salt Lake City, Utah, representative of the Allis-Chalmers Co., is in Chicago, Ill., on company business.

D. H. JACKSON has roturned from Pennsylvania and will make his headquarters in Placerville, Cal., this winter.

ASHLEY HALSEY, superintendent of the Kentucky Ridge mine, near Nevada City, Cal., is visiting in Charloston, S. C.

G. H. PARKER of Los Angeles, Cal., has returned there from Phœnix, Wickenburg and Kingman, Ariz., on mining business.

J. K. BURCH, superintendent of the Abbott quicksilver mine, near Williams, Colusa county, Cal., is in San Francisco, Cal.

G. F. SBURTLEFF, goneral manager of the O. K. M. Co. at Crown King, Ariz., has gone from San Francisco, Cal., to the East.

N. O. BACGE has rosignod as genoral manager of the Black Diamond Copper M. Co. at Los Augeles, Cal., owing to ill health.

R. G. WILSON of Salt Lako City, Utah, manager of the New York Bonauza of Park City, Utah, is in Texas on mining business.

E. W. MUELLER, manager of tbe Sumpter smelter and of the Standard mine, returned to Sumpter, Or., last week from New York.

J. MEICHAN, superintendent of the Mount Jefferson mine at Groveland, Tuolumne county, Cal., is in San Francisco, Cal., on business.

L. F. WRIGHT, manager of the Mountain Copper Co. at Keswick, Shasta county, Cal., is in San Francisco, Cal., on company business.

M. A. MARSBALL is manager of the Terrenates Con. M. Co. at Parral, Chihuahua, Mexico, vice F. Husted, rosigned. E. Graves is superintendent.

A. A. LANE, interested in La Bufa M. Co., operating at Minas Prietas, Sonora, Mexico, has returned to the minos after an extended visit in England.

W. H. KINNON has resigned as manager of the Majestic smelter at Milford, Utah, and M. M. Mays, assistant manager, is temporarily iu charge.

EDW. HOOPER, formerly a partner in the firm of Bewick, Moreing & Co., has left England on professional business in the Western States and Canada.

W. J. SHARWOOD, motallurgist for the Montaua M. Co., Ltd., operating cyanido works at the Drum Lummon mino near Marysville, Mont., is in Berkeloy, Cal.

C. E. BUTLER, formerly of Now Mexico, is suporintendent of tho Trinity County G. M. Co. and the Jenny Lind & Maple M. Co. at Dedrick, Trinity county, Cal.

W. WRAITH, assistant superintendent of the Amalgamated C. Co.'s Washoe smelter at Anaconda, Mont., returned there last week from a trip to Salt Lake City, Utah.

C. F. STURTEVANT has resigned as assistant superintendent of the Anaconda smelter, Anaconda, Mont., and has gone to Bingham, Utah, as superintendent of the Yampa smelter.

J. P. EVANS, general manager of the Colorado Iron Works, Denver, Colo., accompanied by A. W. Gillette, the general counsel for that company, is in San Francisco, Cal., en route to Denver, via Butte, Montana.

A. H. KENNEDY of the Compania Industrial, of Chihuahua, Mexico, has gone to Peru to take the management of the building of the smelting and reduction plant at the Cerro de Pasco mines, at Cerro do Pasco, Peru.

Obituary.

J. GASKIN, a pioneer miner of the Cariboo district, B. C., died at Kamloops, Dec. 1, aged 74 years. Deceased was a native of Ireland.

WILLIAM JONES, a pioneer miner of Tuolumne county, Cal., and former owner of the Star mine, noar Columbia, died near Shawmut, Tuolumne county, November 27, the result of pneumonia.

CHARLES RUNYON, a pioneer miner of Colorado, died on tbe 24th ult. at Leadville, Colo., from old age. Deceased was a member of the John C. Fremont party which went to Colorado in the early 40's, and was with Fremont when he was made Governor of Colorado in 1847. Deceased was a stationary engineer by profession, but has prospocted and mined in many Colorado camps. He was born in Kentucky in 1824.

Catalogues Received.

Of standard size, suitable for permanent file, is the 1904 catalogue of the Buff & Buff Instrument Manufacturing Co. of Jamaica Plain, Boston, Mass., a good specimen of trado treatise dopicting a fine line of engineering, surveying and mining instruments.

The 5th edition of Catalogue 100 of Mining and Motallurgical Machinery, issued by tho Allis-Chalmors Co., is a Spanish one throughout, every line in the sumptuous little volume being in faultless Castilian—a piece of euterprise that purchasers and consumers in Spanish-speaking countries will doubtless appreciate. "Maquinaria para la Minera y Metalurgia" will have a ready welcome south of Lat. 32 Nor.

Cataloguo No. 57, from the Stilwoll-Biorce & Smith-Vaile Co., Dayton, Ohio, is the latest and most complete trade treatiso they have published on their power pumping machinery, including electric pumps, gas or gasoline pumping plants, water wbeels and pumps, hydraulic elevators, otc. A copy will be sent to any address. G. W. Ingils, 11-13 First streot, San Francisco, Cal., is their Pacific coast representative.

Commercial Paragraphs.

CLARENCE S. KING has bought a one-half interest in the C. A. Luckhardt Co., 71-73 Stevenson street, San Francisco, Cal., and has personal charge of the laboratory and oro testing department.

G. C. RICBARDS of the Richards Pump Co., Oakland, Cal., has set up a Richards 3-stamp mill at No. 124 Fremont street, San Francisco, Cal., whore it may be seen in operation. The principal features of this mill are a rocker-arm movement instead of cams, individual mortars and circular screens.

THE firm of John A. Yoatman & Co., San Francisco, Cal., has been absorbed by the United Iron Works (formerly the Oakland Iron Works), of No. 330 Market street, San Francisco, Cal. J. A. Yeatman will have chargo of the hydraulic department, and will continue the manufacture of step pressuro centrifugal pumps and other hydraulic machinory.

J. R. DEREMER, president and general manager of the DoRemer Water Wheel Co., writes from Glenwood Springs, Colo., that the DeRemer Water Wheel Co. have recently installed thirty-three plants of water wheels, and that their works at Denver, Colo., are now in continuous operation to complote water wheels contracted for under time limit. Among the recent installations he reports three at Baker City, Or., two at Sumpter, Or., two at Spokane, Wash., two in British Columbia, three at Lake City, Colo., and one at Encampment, Wyo. The latter plant consisted of twelve wheels, viz., two 4, seven 5 and three 6-foot two nozzle wheels. The company is in receipt of a testimonial from General Superintendent C. H. Tracy as to the satisfactory performance of the wheels.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the follnwing U. S. patents issued tn Pacific Coast inventors:

FOR THE WEEK ENDING DECEMBER 1, 1903.

745,471.—FENCE—I. B. Abraham, S. F.
745,472.—TREATING ORES—W. H. Adams, Jr., Los Angeles, Cal.
745,566.—BOTTLE—I. N. Burke, Butcher Ranch, Cal.
745,428.—HINGE—A. F. Enquist, S. F.
745,600.—CIGAR LIGHTER—J. W. Gray, S. F.
745,601.—STERILIZER—L. L. Gross, Petaluma, Cal.
745,346.—LATHE CHUCK—C. C. Harris, Ukiah, Cal.
745,615.—DENTAL DIES—C. A. Holmes, Seattle, Wash.
745,505.—CUTTING CAN ENDS—J. Lee, S. F.
745,870.—SEPARATOR—L. P. Lowe, S. F.
745,648.—STOVE SUPPORT—D. C. McFarland, Lebanon, Or.
745,510.—TRACTION WHEEL—D. W. McLaughlin, S. F.
745,511.—STEERING WHEEL—D. W. McLaughlin, S. F.
745,641.—DRYING FRAME—E. A. Messerly, Santa Barbara, Cal.
745,647.—FASTENING JAR CAPS—R Murr, Seattle, Wash.
745,518.—BURNER—F. B. Pettingill, Los Angeles, Cal.
745,906.—BEVEL SIDING HEAD—E. C. Price, Eureka, Cal.
745,663.—FARM GATE—B. H. Pursell, Napa, Cal.
745,678.—MOLDER'S TOOL—L. A. Schulze, S. F.
745,679.—MOLDER'S STICK—L. A. Schulze, S. F.
745,680.—CLOCK—H. Schumacher, S. F.
745,918.—WIRE HOLDER—J. Sharp, Portland, Or.
745,682.—WATER HEATER—M. H. Shoenberg, S. F.
745,393.—LOCOMOTIVE TENDER—H. J. Small, S. F.
745,910.—PAINTING SHINGLES—B. F. Smith, Seattle, Wash.
745,688.—CAMERA—A. L. Swartz, Junction City, Or.
745,463.—WIRELESS TELEGRAPH—G. T. Swenson, San Pedro, Cal.
745,949.—GOLD SEPARATOR—M. O. Wright, Sultan, Wash.
745,710.—ORE CRUSHER—H. Yarnell, Pasadena, Cal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

ELECTRICAL WATER HEATER.—No. 745,682. Dec. 1, 1903. M. H. Shoenberg, San Francisco, Cal. This invention relates to an apparatus which is especially designed for continuously heating a flowing stream of water, which may be received at a low temperature at one end of the apparatus and constantly discharged at a higher temperature at the opposite end. It consists of a continuous tube having an enlarged section intermediate of the ends, said section having an insulating non-conducting coating and a high-resistance wire wound thereon, with means for passing an electrical current through the wire. There is also a means for maintaining a continuous return flow through a flexible or other pipe, whereby a column of heated water will be constantly maintained at the nuter end of said pipe and in conjunction with a discharge apparatus at said outer end, through which the hot water may be drawn for use at any instant.

STERILIZING AND DRYING APPARATUS.—No. 745,601. Dec. 1, 1903. L. L. Gross, Petaluma, Cal. This invention relates to an apparatus which is especially designed for sterilizing and drying implements of various descriptions, such as razors, barbers' tools, surgical implments, and the like. It consists of a chamber having a screen or other equivalent surface formed within it adapted to receive the implements to be treated and circulating pipes through which air and the vapor of any suitable antiseptic or sterilizing substance may be passed and brought into contact with the implements within the chamber. There is also a chambered cover adapted to contain water which is heated therein and which may be withdrawn therefrom whenever needed.

GEOGRAPHICAL CLOCKS.—No. 745,680. Dec. 1, 1903. H. Schumacher, San Francisco, Cal. This invention relates to improvements in time pieces whereby the time for any place in the world may be determined instantly and the time of that place noted relative to any other place. The invention consists, in part, of a stationary dial having radial division lines corresponding to certain units of time measurement, between which lines are printed the names of cities lying in any corresponding meridian interval. Concentric with this disk is a revoluble dial making one revolution in twenty-four hours and having the hours marked nn weighted disks pivoted to the dial and adapted always to maintain an upright position so as tn be easily read. This dial is movable in relation to a stationary pointer which is set over the city whence time is to be measured.

ELECTRIC CIGAR LIGHTING DEVICES.—No. 745,600. Dec. 1, 1903. J. W. Gray, San Francisco, Cal.; all assigned to H. E. Pyburn, same place. This invention consists of a standard and support adapted to be fixed to the wall or other convenient point, a cone fitting a corresponding recess in the support having a handle by which it is turnable, a means for supplying a jet of gas through the standard and cone and through a projection on the opposite side from the handle, electrical contacts carried by the handle and by an insulated post, so that when the handle is turned to complete the electrical contacts this action will first open the gas supply port and in time to allow the gas to reach the point of electrical contact, so that it will be ignited when such contacts are made and broken. There is also a spring for returning the handle after the operation is completed.

Latest Market Reports.

SAN FRANCISCO, December 11, 1903.

METALS.

SILVER.—Per oz., Troy: London, 27½d (standard ounce, 925 fine); New York, bar silver, 54¾c, refined (1000 fine); San Francisco, 54¾c; Mexican dollars, 43@45c San Francisco, 41c New York.

Silver has fallen over 3 cents in New York and San Francisco during the past week, while the London price remains unchanged.

COPPER.—Now York: Standard, $12.25; Lake, 1 to 3 casks, $12.50; Electrolytic, 1 to 3 casks, $12.12½; Casting, 1 to 3 casks, $12.00; San Francisco: $15.00. Mill copper plates, $17.00; bars, 18@24c. London: £56 10d spot per ton.

Within the week copper has advanced somewhat in London, while declining a fraction in New York. The slight advance in London of about ¼ cent per pound is stated to be due to speculative buying.

LEAD.—New York, $4.25; Salt Lake City, $3.50; St. Louis, $4.00; San Francisco, $4.50, carload lots; 4¼c 1000 to 4000 lbs.; pipe 6½, sheet 7, bar 5½c; pig, $4.75. London: £11 1s 3d ₱ long ton.

SPELTER.—New York, $5.25; St. Louis, $5.10; London, £21 ₱ ton; San Francisco, ton lots, 6½c; 100-lb. lots, 7c.

TIN.—New York, pig, $27.00 @ 27.25; San Francisco, ton lots, 28½c; 500 lbs., 28½c; 200 lbs., 29c; loss, 29½c; bar tin, ₱ lb., 30@32c. London, £123 7s 6d.

PLATINUM. — San Francisco, crude, $18.00 ₱ oz.: New York, ingot, $19.00 ₱ Troy oz. Platinum ware, 75 @ 82c ₱ gram.

QUICKSILVER. — New York, $46.50@47.00, large lots; London, £8 7s 6d; San Francisco, local, $44@44.50 ₱ flask of 76½ lbs.; Denver, $48.00. Export, $42.00@42.50.

SITUATIONS WANTED.

A COMPETENT MILLMAN OF 10 YEARS' EXperience would like to take charge of a mill in any part of the country, understanding cyaniding thoroughly. Wife would like to take charge of boarding house at same place. Address W. G., care of Mining and Scientific Press.

A PRACTICAL MINING MAN DESIRES TO associate himself with a reliable company. Has had twenty years experience, during which time he has worked regular shifts in every department in mill and mine; the past six years has held position of Superintendent and Manager of property working 250 men.
Practical—not theoretical—knowledge of construction and operation of mills, aerial and surface tramways, power transmission, installation of boilers and machinery, shaft sinking, mine timbering, assaying, etc. References from present and former employers.
Address "Resolute," care Mining and Scientific Press, San Francisco, Cal.

COMPETENT YOUNG ASSAYER AND METallurgical Chemist, with experience in the mines, especially cyaniding, but at present laid off on account of shut-down for the season, desires a steady position. Address K., this paper.

ENGINEER DESIRES POSITION AS SUPERintendent of mining. Best experience obtained in Idaho, Butte, Utah and Colorado. Excellent references. Address T. Worth Bowen, Butte, Mont.

EXPERIENCED MILLMAN WISHES POSItion. Address Box 202, Enterprise, Cal.

MANAGER LARGE GOLD MINING AND milling company in Arizona desires to change his location and obtain similar position with desirable company elsewhere. Best of references from present employers. Address I. C., this office.

MANAGER OR SUPERINTENDENT. ADvertiser has had twenty years experience in Mexico, California and Colorado in mine operating and mill management. Fully conversant with the installation of power plants, aerial tramways, erection and running mills, shaft sinking, mine timbering, diamond drill work, etc. Understands the management of men as well as machinery, and can obtain first-class results.
Seven years of successful work in present locality. Desire a change. Disengaged January 1, 1904. Highest references as to ability, responsibility, practical and technical knowledge.
Address "Industry," care Mining and Scientific Press, San Francisco, Cal.

MANY TIMES DURING THE PAST TWENTY years I have been engaged in reconstructing mills to make possible a closer saving; in altering aerial tramways to cheapen transportation; in changing mining methods to make possible cheap ore extraction.
Have you any trouble about your plant? Do you contemplate changing or enlarging your works? Is the extraction of ore costing you too much? With my working knowledge and experience I can overcome your difficulties. Permanent situation with first-class metal mining company preferred. No objection to foreign country. Highest references as to ability, honesty and responsibility. Address "Dividend," care Mining and Scientific Press, San Francisco, Cal.

MECHANICAL ENGINEER, TECHNICAL graduate, desires responsible position with gold dredging company. Ten years' experience as manager, constructing and consulting engineer gold dredges. Special experience saving fine gold. Can design and build complete plants. Will take position opening new ground or with going company. Address "Dredging," care of Mining and Scientific Press.

MINING ENGINEER AND METALLURGIST, graduate of German University, with large experience in the treatment of refractory gold ores by all processes, desires position with good company. Cyaniding and treatment of slimes a specialty. Age 33. Excellent references. Address N. W. 43, care of Mining and Scientific Press.

MINING ENGINEER AND METALLURGIST, with sixteen years of practical experience as superintendent, manager and consulting engineer of mines and mills, desires position on or after January 1st. Speaks Spanish fluently. Address P. O. Box 77, Durango, Mex.

PHYSICIAN, WHO IS ALSO METALLURGIcal Chemist, wishes position as mine surgeon and assayer. Accustomed to base ores. Best references, character, ability. Speaks Spanish. Good location desired more than large salary. Address Dr. Porter, this office.

POSITION WANTED BY NEW YORK ELECtrical engineer with Pacific Coast company. Experienced in construction work and selling. A position where he can work into the selling end preferred. References from company with which he is now connected. Address G. P., this office.

SUPERINTENDENT IS OPEN FOR POSITION to develop gold or copper properties; experienced miner; can make underground maps and models, also do the assaying; speaks Spanish; good references from past companies. Address "Develop," care this office.

SUPERINTENDENT, COMPETENT ASSAYER, Chemist and Surveyor. Special experience in development work; free or base ores; millman. Equipment complete. Address "Seattle," this office.

WANTED, SALARIED POSITION WITH GOLD mining company; five years' experience as assayer and ten as superintendent of quartz and hydraulic mines; have my own assay outfit; terms reasonable. Address A. L., Pacific Grove, Cal.

WANTED, POSITION BY MACHINIST AND Engineer; efficient in steam, electricity and compressed air; seven years' experience at mines; good references. Address Box 54, care of Mining and Scientific Press.

WANTED—POSITION AS SUPERINTENDENT or assistant of copper mines and smelters; competent all round man, good assayer, analyst and draughtsman; can handle labor; speaks Spanish. Address "Smelter," care this office.

WANTED—POSITION BY A MAN WHO HAS had 15 years experience in mining; 8 years as Superintendent. Speaks Spanish. Address "M," this office.

WANTS POSITION AS SUPERINTENDENT, Assayer, Millman, Steam Engineer, or Tool Sharpener. Fifteen years' experience. Have good assay outfit. Address J. L. Wetmore, Rich Gulch, California.

WANTED—POSITION AS ASSAYER, BOOKkeeper and Stenographer with mining company or firm in mining town. Wistrand, Oakland, Cal.

Offers Wanted for Any of the Following:

Air Compressor, 12"x12", Laidlaw-Dunn, belt driven, new.
35 H. P. Horz. Tubular Boiler, complete; will be tested to 150 lbs. pressure; first-class condition.
Portable Drilling Outfit, suitable for prospecting or water wells; good condition.
Douglass Pump, No. 6, force feed, never used.
Iron Turntable, 7 ft. diam., having two 30" gauge tracks.
Two Mine Water Buckets, 54 gals. capacity, complete with valves.
One Ore Skip, body 36" top, 48" bottom, 30" high, 24" wide.
5 H. P. "Almond" Right Angle Coupling, new.
Barrett Swivel Wrench, good condition.
6 H. P. Gasoline Hoist.
Two 5" Genuine Jenkins High Pressure Globe Valves.

Address Box 42, Mining and Scientific Press, San Francisco, Cal.

A COMPLETE CONCENTRATING PLANT

Can be bought at 12c on the $1. The machinery is of the highest type and in good condition.

One 200 h. p. Corliss Type Engine. Two Safety Tube Babcock & Wilcox Boilers, about 250 h. p. One 800-lb. High Mortar 40-stamp Mill, rapid drop. One 9x15 in. Blake Crusher. Eight Tullock Automatic Ore Feeders. Twelve Double-end 3-Compartment Hartz Jigs. One 4-Compartment Single Hartz Jig. Six Sets Revolving Screens, all housed in. Two Sets of Elevators, complete. All necessary Shafting, Pulleys, Boxes, Belting and most of the piping, etc. This plant has been used very little. It cost $100,000; is sold at once, will take $12,000 for it. Located on the D. & R. G. Ry.

Application of the Cyanide Process.

Since its first discovery and application the cyanide process has grown steadily in importance and considerable further progress is possible. A great deal has been learned concerning it, and great advance has been made in its proper application, but there still seems much to be desired in this process. Its success is being measured largely by its commercial result. In low-grade camps, or in those districts where nothing remains to be treated by this process but low-grade tailings, the strictest economy prevails and extraordinary effort is made to secure the highest possible extraction at the least expense. The result is that such low-grade material after treatment is so depreciated in value as to be, at the present time, practically worthless. In other districts, where the ore or the tailings are high grade, much less care is used, and extractions are comparatively much lower, and the value of the discarded tailings in those regions is often greater than that of some of the low-grade ores and tailings before treatment in the districts first referred to. In the high-grade mines the standard of excellence, while high, still leaves values in the tailings, which makes the extractions low as compared with those of the low-grade camps. This is of course due to local conditions which sometimes do not admit of a higher extraction at a profit at the present time. A few years later these now valueless tailings dumps may be retreated at a good profit. In the operation of the cyanide process many valuable discoveries are made in a purely accidental way. In Western Australia one writer states that higher extractions were obtained from a charge of ore which while under treatment by the cyanide process was accidentally charged with a quantity of sulphuric acid instead of bromo-cyanogen. Experiments along this line in the treatment of telluride ores may result in further important discoveries.

Bromine and iodine have both been used in this process, the latter in an experimental way. The former is in extensive use in association with cyanide, and usually with satisfactory results, particularly in the treatment of telluride and arsenical ores, carrying gold.

Liquid chlorine has also given satisfactory results in some instances when charged with cyanide solution, especially in the treatment of auriferous sulphides, but the fact that it works well at one place cannot be taken as an indication that it will operate equally well elsewhere. In fact, after about a dozen years of extensive experiment and application of the cyanide process in its many forms, it is becoming recognized that no hard-and-fast rule can be adopted. Each district requires its peculiar manipulation, and often the ores of different mines in the same district require different treatment. This refers to the detail and chemistry of the process, for the various mechanical devices employed in the process have, apparently, almost reached perfection, and are a tribute to the inventive genius of the men who have devised them.

No great improvement has been made in the recovery of the gold from the solutions. There are a number of ways by which this is accomplished, but the zinc precipitation process is the one most commonly employed. In this part of the process there is still room for improvement. If some means could be discovered to recover the gold in as easy and simple a manner as in the chlorination process, where gold is precipitated by a solution of iron sulphate, or in the bromine process, where the gold is thrown down by sulphuretted hydrogen, it would be a long step in the improvement of the process.

The success of the cyanide process has proved a great incentive in discovering newer and better wet processes. It has also led to the invention or introduction into the metallurgical world of a number of processes, which have nothing in particular to recommend them over processes already in use. It is possible to devise a process which will extract precious metals from their ores, but at a cost that is in excess of the amount recovered. This is a feature of metallurgy not greatly sought after.

In the early history of the process the treatment of slimes formed a great drawback to the progress of this method of ore reduction, but to-day in some works slimes are purposely created, for the reason that usually a higher extraction results, and the difficulties are almost wholly of a mechanical sort. To a great extent this has been overcome by hydraulic sizing of the pulp from the crushing mill before changing to the cyanide vats, it having been found that it is more difficult to treat coarse and fine material together than to treat them separately. A notable instance of this is found at the large cyanide plant at the Homestake mine in South Dakota.

Among the latest efforts, as well as among the first, in the application of this process, is the treatment of sulphides direct, after concentration. It was long since learned that finely pulverized pyrite and other sulphides generally yield a high percentage of their gold values, while coarser material will yield only 50% to 75%. The high-grade sulphides should be finely ground before treatment, but low-grade material usually cannot afford the additional cost of grinding.

THE creation of a mining court for British Columbia is being agitated in that Province, the particular function of which would be the settlement of mining disputes, and to do so promptly. In the United States, when mining property becomes involved in litigation, it is entirely beyond the range of human knowledge to even surmise when such litigation will come to an end. In many instances mining suits have dragged along for years, until the principals to the dispute grew old and gray, and the legal battle has been left as a legacy to their children. If the real reason for this long-drawn and expensive litigation is due to the fact that the courts are overtaxed with lawsuits of many kinds, then a mining court would be a welcome thing in the United States as well as in the British colonies, where such tribunals have long since demonstrated their usefulness.

FOR many years the mining industry was conducted almost wholly by practical men who had grown up in the business and learned what they knew in the school of experience. The knowledge and experience of many successful men have been placed in forms where others may have the benefit of it, usually either in a textbook or a series of lectures. Both are used at the various mining schools where students are familiarized with the best methods in use everywhere, besides which they are instructed in various scientific branches of use in the mining industry, including chemistry, metallurgy and engineering. The result is that the management of the industry is passing into the hands of younger men, who have been thoroughly coached in the fundamental principles of the industry, and this is called a "technical education." In addition to this technical training, which is also practical, they have each year opportunity for practical work and observation in the mines, mills and other metallurgical works. They are trained to observe, and though not usually proficient workmen at first, they generally advance with rapid strides, because they apply the knowledge they have gained to the best advantage, are usually quick to grasp any new idea and apply it intelligently in new places under differing conditions.

The Selection of a Plant.

The owner of mining property is not infrequently undecided as to the character of works that should be built to treat his ore. Despite the fact that mining has now been successfully carried on in the western United States for more than fifty years, and much longer than that in some of the Eastern States, and notwithstanding the extensive and valuable knowledge gained through the medium of operations in foreign countries, it is not always a matter easy of determination in deciding on the kind of metallurgical works to build for the beneficiation of ore. In the early history of mining in the West, both mills and smelting plants were erected at the wrong places. Mines that had mills would have been better fitted to treat their ores had smelters been provided, and sometimes where smelters were erected mills would have answered the purpose better, and in other instances properties were equipped with both mill and smelter when there was not sufficient ore to supply either. In the greater number of instances the mill was the better for general purposes in the early days, but in more recent years the smelter is finding a wider application. In many places both mill and smelter are run in connection with one property, the ore first being crushed, then concentrated and the product smelted. Such instances are not common, but are found, particularly in connection with the copper mines of Butte and some other copper districts. Where the ore is of the concentrating class in many cases, the ores are concentrated at the mine and the concentrates shipped to smelters at a distance. The building of an extensive railway system throughout the West has made this possible. The ores of the greater number of lead-silver mines are treated in this way, and also many of those producing copper with gold and silver as an accompaniment. In some districts, the ores are more complex, zinc and iron sulphides appearing, as well as copper and lead in the ore. The introduction of processes and machines to effect a separation of the several sulphides to themselves has still further added to the possibilities of ore treatment, until it would seem that the mine owner could not easily make a mistake in ordering a reduction plant of any kind, but such is not the case. The ore may be adapted to smelting, and still the cost of flux and fuel and other considerations, due to location of the property, may render the smelting process unprofitable. There are few smelting ores which cannot be concentrated to a greater or less degree, and the problem is often solved by building a concentrator. Where a mine will pay by neither the milling or smelting process, under existing conditions, the only solution of the problem is to wait until conditions change for the better.

In many instances mines which are free milling at the surface, in depth develop base ore which must be smelted or concentrated, and in not a few instances the character of the ore changes entirely. A vein carrying a free-milling chloride silver ore at the surface, has in depth run into galena and iron sulphide, and at greater depth into zinc sulphide to the almost complete exclusion of other ores.

Lead mines have in depth become copper mines, and in rarer instances a base mine has developed a free-milling zone in depth.

In view of the uncertainty as to character of plant best adapted to the treatment of the ore, when viewed from the standpoint of the inexperienced owner, the best way is to submit the proposition to a mining engineer of experience whose opinion, while it may seem high priced, may save the cost a hundred fold, beside which it may mean eventually the difference between success and failure. The problems of metallurgy are so numerous, and often of uncertain character to those unfamiliar with them, that this would seem the only safe course to pursue.

THE Supreme Court of California has handed down a decision to the effect that all locations must conform to the pre-existing Government land surveys, even though the subdivisous of the section in which the land is situated shall exceed 160 acres, due to inaccuracies of the land survey. The existence of narrow, usually wedge-shaped pieces of ground along the section lines, as is frequently the case, has led to the location of small fractional claims between to full-sized previously existing locations. Oil lands are subject to location under the placer laws. A single location shall not exceed twenty acres, though an association of persons may take 160 acres, and the Supreme Court has decided that the location must conform to the lines of the land survey, notwithstanding any inaccuracies. In rendering this decision the Supreme Court has reversed the Superior Court of Kern county, Cal.

The Government and the Miner.

The principal condition under which the locator of a mining claim holds possessory title to his location after the preliminary act of locating is by means of performing annually on his claim not less than $100 worth of labor or making bona fide improvements on his claim to that extent. This is the minimum, and to it State and Territorial Legislatures and district laws may add, but they cannot decrease the requirement of the Federal law. Many are the schemes to defeat this moderate demand of the Government. Claims are relocated year after year by the same persons; others make a mere pretense of working; still others claim work done in previous years as having been performed within the year past, but the fact remains that the Government requires the annual expenditure of money or work or betterment of the claim, directly or indirectly. Men may defeat the law by failing to comply with its requirements, but it is safe to say that in the majority of such cases the neglected, or misrepresented, claim would not sell for $100 cash. No claim holder can hold his location against an adverse claimant if the assessment work is not actually performed according to law. Failure to perform the labor or make the improvements required by Federal, State and local laws is equivalent to abandonment of the claim, and therefore it becomes, under the law, subject to appropriation by another.

Discovery of a claim and assessment work are entirely separate. By the discovery and act of location the prospector establishes a source of title, but it is only by the performance of the assessment work required by the laws that he can preserve and perfect that title. The law does not require the claim holder to take out a patent for his claim, but permits him to do so after having made improvements, or performed development work to the extent of $500, on the claim.

Some large and valuable mines are held for years and even worked out without a patent ever being applied for. The miner is entitled to as many rights under the possessory title as he secures under a patent, the only advantage in which appears to be that he becomes absolute possessor of the claim and is no longer required to annually perform assessment or representation work. Few owners of profitable patented claims care to cease operations when patent has issued, merely because the law permits it, unless, indeed, the claim becomes unproductive.

There are those who consider the cost of securing a patent to mining land a great hardship as compared with a patent to agricultural land. The usual full-sized mining claim contains about twenty acres of ground; the usual agricultural entry contains 160 acres, or eight times as much as a mining claim. The difference in cost is considerable, it is true particularly when a comparison is made of the relative area of the two claims, but, as previously stated, taking out a patent to a mining claim is not peremptory, and the owner of such a location would be unwise to patent a claim that would not produce a profit. Ordinarily, a single foot along the course of a good-paying mineral vein will produce more profit than several farms of 160 acres each are capable of producing in a number of years. This is not by any means the rule, but it is often the case.

The year 1903 is about closing and those holding claims by performance of annual assessment should not neglect to begin at once upon this work if they have not already done so, and to continue it to completion. The mining laws are sufficiently liberal, and are framed with the purpose of developing and advancing the mineral resources of the country while affording to the bona fide locator the protection of the Government.

CONCENTRATES.

THE Hungarian riffle as now made is usually of cast iron, and is broader at the top than on the base. This leaves a blunt, wedge-shaped opening between the riffles.

✣✣✣✣

DESCRIPTION of a "beach washer," which, it is said, works well on beach sands containing fine as well as coarse gold, was published with a sketch of the same in the MINING AND SCIENTIFIC PRESS of June 6, 1903.

✣✣✣✣

SANDSTONE, when employed in buildings, should never be set on edge, but always laid with the bedding in a horizontal position. When the weight comes upon the upturned edge of standstone it has a tendency to split.

✣✣✣✣

AS rope carriers in shafts, particularly where the angle of dip changes, and idlers are required on the hanging wall side of the shaft, grooved sheaves in pairs are better than any form of cylinder of either wood or iron.

✣✣✣✣

NO ONE may enter a placer claim legally located and held by another for the purpose of searching for a lode or vein, nor can men working for wages on a placer location, claim a vein which they may discover thereon in the course of their work.

✣✣✣✣

THE rock specimens from Mazama, Wash., are: No. 1, diabase, and No. 2 diahase-porphyrite. The only essential difference being in the fact that No. 2 carries well defined crystals of feldspar, which are absent in No. 1, at least in the specimen sent.

✣✣✣✣

WHEN mixing sand, rock and cement for making concreto, it is necessary to keep the mixture free from dirt, soil, etc. It is also a good idea to wash the broken rock. The best results are obtained hy screening the sand used. It is not good to use too much very fine sand.

✣✣✣✣

THE magnetic compass cannot be depended upon in making underground surveys owing to the unreliability of the needle, which is attracted by tracks, drills, pipes, machines, etc., and also often hy magnetic mineral in the rocks. The compass will sometimes vary several degrees within a few feet, in underground workings.

✣✣✣✣

A SKIP can be provided with safety clutches similar to those in use on cages, but for their operation guides are also essential. When safety clutches are placed on either a cage or skip they should be of the best design and workmanship, as in case of necessity all depends upon their prompt action to avert disaster.

✣✣✣✣

A TUNNEL started on A's claim cannot be continued through B's claim, even though the distance be but 20 feet, without the consent of B. There are decisions of the United States Supreme Court determining that point. If the distance be so short it would be better to run around the line of B's claim, which can be done without interference.

✣✣✣✣

THE stress on a hoisting rope in a shaft sunk at an inclination of 63°, which is equivalent to a rise of about 200 feet in 100 horizontal distance, is about 1800 pounds per ton of 2000 pounds. To this must be added friction. At 28° to stress is only about 1000 pounds per ton of 2000 pounds. The stress decreases with decrease of angle of inclination of the shaft.

✣✣✣✣

STEAM may be conveyed from a boiler to points several hundred feet distant underground in a mine, but to prevent excessive condensation the pipes should be thoroughly wrapped with non-conducting packing and hoxod. Valves should also be provided to drain any low places which occur in the pipe line where any condensed water would accumulate.

✣✣✣✣

THE Coxbeath mines of Cape Breton, N. S., comprise a series of veins in rhyolite and diorite. The gangue is quartz, in which occurs argentiferous and auriferous chalcopyrite. Copper veins occur elsewhere in rhyolite, granite, quartz-porphyry, amphiholite schist, diorite, limestone, quartzite and in a great variety of other rocks.

✣✣✣✣

COPPER can not he mined in Mexico without previously obtaining the proper concession, and for this reason no workings are permitted in mines or placers which are not properly protected by a legal title which has been registered. Any inhabitant of Mexico may present an application for a mining concession, hut foreignors are subject to slight restrictions in certain localities.

✣✣✣✣

THE so-called blue leads of California are ancient rivers, usually containing gold in the gravels. These streams in many cases have been uplifted by geological disturbances, above the level of the recent gulches, though in some instances they are below them. These ancient streams are rarely below the main canyons of the vicinity when they are found. Some of the channels of the Forest Hill divide are 1500 feet below the summit of the ridge under which they occur, having been buried to that depth beneath the volcanic mud and debris, hut these channels are several hundred feet a hove the forks of the American river. Tho channels, which are red, were bluish or gray in depth, the red color being due to oxidation of the iron of the gravel.

✣✣✣✣

THE spectroscope is an instrument otten employed in determining mineral substances. This is done by heating the substance to be treated to white heat, and the spectrum produced by passing the rays emanating from the burning hody through a prism is examined by means of the spectroscope. The spectrum is crossed hy perpendicular lines, which, according to their number and position on the spectrum, afford a means of determining the mineral.

✣✣✣✣

WHEN setting boilers everything should be so arranged as to he in plain sight and easy of access, so that should anything go wrong, the danger could be detected at once and the necessary repairs made. There should be no dark corners, or if such are necessary, provision should be made to light them artificially. When a boiler explodes, an examination is made to ascertain the cause, but it is not always possible to learn it after the explosion. By proper setting and competent engineers or firemen an explosion may he averted.

✣✣✣✣

ANNEALED SILVER WIRE offers less resistance to the electric current than any other metal known. With pure copper at 1, annealed silver is 0.98, gold 1.3, aluminum 1.5, zinc 3.2, iron 6.22 and mercury 63.2. Resistance is affected by temperature, length of conductor and cross-section. The resistance of a conductor having a uniform section or area is directly proportional to its length. A conductor (wire) 2 feet long would offer twice the resistance that would be offered hy a wire 1 foot long. Resistance is inversely proportional to area of conductor—that is, resistance decreases with increasing area. A rise in temperature of a conductor increases the resistance of metals, but decreases that of carhon.

✣✣✣✣

MINERALS are said to he pyro-electric when they emit a dull phosphorescent light when struck or rubbed in the darkness or hoated to certain temperatures. There are a number of minerals which possess this property, as well as some organic substance. In Mariposa county, Cal., is found a vein of mineral composed largely of lime, with numerous base metal sulphides, blende, galena, chalcopyrite, etc., with also silver and gold. This rock, when scratched in the dark, emits a phosphorescent light. Loaf sugar will act in the same manner when rubbed or scratched. Fluorite is strongly phosphorescent when heated. Some diamonds become phosphorescent after exposure to the rays of the sun and will emit light in the dark.

✣✣✣✣

THERE are no extralateral rights in Mexico. The miner is confined to the lines hounding his claim extended downward and vertically. The unit of a claim is the pertenencia, a block of ground 100 meters square; hut a claim may consist of several pertenencias. For the purpose of taxation, a fraction of a pertenencia equal to or exceeding one-half a full claim is considered as a full claim. Fractions comprising less than one-half a pertenencia are not taxed, unless they constitute a separate concession by themselves. Such a fractional claim can not be taken unless it lies between two other claims already taken. The number of pertenencias which may be taken by one or more applicants is not limited, so long as there remains free ground to take.

✣✣✣✣

WHERE the owner of a mine, located at a greater elevation than the neighhoring property and the water flows naturally to the lower mine, there is no redress for the lower proprietor; but where a higher proprietor purposely carries on mining operations in such a way as to cause water to flow into an adjoining proprietor's mine, which would not go there naturally, then the lower proprietor has redress in the courts. Where the owners of a higher mine removed the mineral to such an extent that the ground caved, forming a catchment therein, causing the water to accumulate therein and to flow into and damage an adjoining mine, the court held that the owners of the higher mine were responsible for damage to the lower mine. (Homer vs. Watson, 79 Pa. St., 242; 21 Am. Rep., 55.)

✣✣✣✣

THE latest available statistics on production of asbestos are those of 1901. When in the United States the production was confined to the mines of Sall Mountain, Ga., with a small amount from Riverside Co., Cal., and from Berkshire Co., Mass., the whole production being 747 short tons, valued at $13,498. The largest amount of ashestos produced in the United States since 18$0 was in 1883, when it reached 1200 tons, valued at $36,000. The succeeding two years 1000 tons were produced anually, worth $30 per ton. Since that time—1894—the production has ranged between 50 tons and 500 tons annually, until 1900, when it reached 1057 tons, valued at $16,310 or about $15 per ton. The demand is apparently not on the increase. Magnesite has hcen substituted for asbestos in many kinds of fire proof and refractory materials.

✣✣✣✣

A PIT for the reception of a mortar block of any description need not necessarily go deeper than the bedrock. A short mortar block—6 or 8 feet—will answer as well as a longer one, if it rests upon bedrock. The block should be of sufficient depth to afford a substantial anchorage for the mortar bolts. Where bedrock foundation is not encountered in a pit 12 to 14 feet deep, it is sufficient to make a foundation of concrete. This should be broader and longer than the mortar block itself, which may be of concrete or of wood. There is much diversity of opinion as to the best material for mortar blocks. Some prefer concrete, others solid blocks of wood, and others favor blocks built up of planks, spiked together. The latter, when properly made, have afforded good satisfaction. It is not good practice to form a pit hy building concrete about it, and sitting the block within the pit so formed, unless the pit be sufficiently large to permit a man to work between the side of the block and the walls of the pit. A mortar block rots, if at all, on the outer portion, while the center may remain solid. By having the pit wide enough to permit men to work between the block and the wall, the decaying portion may be removed, if it he a built-up block, and new planks placed in their stead. The plan of forging rings on the lower ends of the anchor bolts, and securing them hy driving a heavy iron bar through them and entirely through the block, is a good one, and prevents the bolts from shifting in case of the decay of the outer portion of the block. When the block is in position, the pit may be filled with tailings, which makes a firm, unyielding packing for the block, but is a material easily removed, in case that repairs are necessary.

✣✣✣✣

REPLYING to an inquiry from Plumas county, Cal., it would be difficult, if not impossible, to estimate the power to run an arrastra owing to lack of any co-efficient for friction. An arrastra made with great care, having a turned spindle working in a well-lubricated box with ball-bearing carriers on the outer rim of the horizontal water wheel would require far less power than one built in the usual fashion, having wrought iron spindle forged by a blacksmith, and working in a hole drilled in a rock. The friction of the drags on the floor of the arrastra basin changes with the condition of the ore, being the greater when the ore is coarse than when it has been ground to the condition of sand. The amount of water employed in the pulp also makes a great difference in friction. The speed of an arrastra varies all the way from two to three revolutions per minute with a horse or other animal, up to fifty or more revolutions per minute with steam, water or other power. Less power is required to turn it slowly than rapidly. As fast as it can be run without surging the pulp out of the basin is not too fast for an arrastra to run. A round nozzle will afford as much power on a horizontal wooden water wheel as any other shape. The amount of force which the wooden buckets of an impact wooden water wheel will stand is proportional to the kind of material employed in construction, as well as the manner in which the wheel has been built. A well constructed wheel will stand a great deal more force than a light, flimsy wheel. The loss of power by rope transmission is practically the same for a long as for a short distance providing there be no intervening idlers. The amount of power which a given quantity of water will develop under stated head will he found in any book dealing with hydraulics.

✣✣✣✣

TO ROAST copper ores economically by the "heap roasting" method, the bed should be laid in a situation where the ore can be delivered from cars passing over a trestle or bridge, so that the ore may he cheaply distributed. The coarse ore is laid on the wood at the bottom of the heap, the finer material following, and the surface finished by placing still finer material over all. It is economy to build two heaps close together and to then fill the space between these heaps with an additional quantity of ore, forming one large heap. The central heap is not built until the two outside heaps have been completed, fired and been burning at least two weeks. A bed of wood is laid in the floor between the two burning heaps, and extending well up on their sides. This layer of wood is thinner than that laid for single heaps. When the wood has been placed the ore is dumped on as quickly as possible and the top finished with fines, as in single heaps. The result of this method of roasting is that a much larger percentage of the ore is thoroughly roasted than in single heaps, as the layer along the sides of the original piles is completely roasted, which is not usually the case in the ordinary method. This method, known as the "V" method, reduces losses by insufficient roasting to a minimum. It also economizes space in the roasting yard. The "V" method was first introduced by the Canadian Copper Co. at their Sudbury mines, Ontario, and it has since come into extensive use wherever heap roasting is practiced. Copper matte may also be roasted in heaps, but matte is much more difficult of desulphurization than sulphide ore, and requires two or three separate burnings to eliminate the sulphur preliminary to smelting. The process of desulphurization of matte proceeds to only a limited degree upon the first roasting, and this fact has led some of those undertaking this method of treatment to abandon it, but the desulphurization has usually progressed further than the appearance of the matte indicates. A second or even a third roasting is, therefore, necessary. Each succeeding roast, however, requires an increasing amount of fuel, owing to the decreasing amount of sulphur. Matte heaps should not exceed 12 feet square in area. Such a heap, when about 6 feet in height, will contain 60 to 70 tons of matte. The wood is placed on the floor as in ore roasting. A single central chimney formed of sticks of wood is sufficient, and about this the matte is heaped. When completed, the mound of matte should be covered with completely burned ore from the roast heap.

The Mines of Santa Eulalia, Mexico.*

Written for the MINING AND SCIENTIFIC PRESS by P. B. AIKEN.

The Santa Eulalia mines are situated southeast of the City of Chihuahua, Mexico, about 15 miles. Most of the mines are located upon a low mountain at about 1500 feet above the snrronnding valleys, and 6000 feet above sea level.

GEOLOGY.—The formation of Santa Eulalia is limestone, capped in places with porphyry of greater or less thickuess. The ore, which consists of silver-bearing lead carbonate and sulphide, occurs chiefly in the limestoue, either in fissures or in floors, and irregular masses. The limestoue is stratified, and is tilted usnally to the east. At some geologic period there has beeu a disturbance, accompanied by the intrusion of the porphyry, which resulted in the fracturing of the limestone. It is chiefly in and near the fissnres that the ore bodies are found.

The fissures have been the channels for the passage of mineral solutions, which had penetrated from the fissure along the bedding planes of the limestone, and at favorable places has dissolved, and carried away large masses of limestone, leaving great natnral caves at various depths, and sometimes several hundred feet away from the fissnre, and then afterwards by a process of alteration and of deposition mineral solutions have filled, or partially filled, many of these caves with ore.

These great caves, now open in many of the mines, are of wonderful extent. Ou the 1300-foot level of the Hearst miue was enconntered what they call the "Bnll Pen" (from its oval shape). In some places it measures as much as 450 fcet in diameter and 100 feet high. From this great cave many thonsands of dollars of high-grade ore has been taken. The great cave in Parcionera is said to be large enongh to contain the Chihnahua Cathedral without a spire touchiug the roof or walls. Similar caves are fonnd iu Sau Jnan and Bustillos and other mines. Some of them are wholly natural, while others arc the result of the extraction of massive ore bodies in mining opcrations. The illnstratiou ou the front page shows the formation of stalactites aud stalagmites iu one of the mines.

HISTORY.—It is difficult to place the exact date of the discovery of these mines. They certaiuly antedate the founding of the City of Chihnahna, and have probably been worked for over 300 years. They were first worked by the "Ancients," later by the Spaniards, Mexicans and Americans.

The Spaniards apparently did mnch intelligent development work, aud extracted great quantities of ore. Then the Mexicans followed; but did little more than simply remove bodies of ore left by the Spaniards, and when these bodies in the upper level were removed the mines were abandoned as worked ont, for a Mexican will not look for ore at greater depth, if it becomes exhansted or of too low grade to give him a profit.

At abont this time the Mexican Central Railroad entered the conntry and a concession of the mountain was secnred from the Government by a Mr. Robinson, and after some years of inactivity they decided that they were paying taxes on too mnch land, so they abandoned to the Government all land save two pieces, which they cousidered their best promising mines. These are Sau Domingo aud Zubiate, which they still own and are now operating.

The abandoned properties were gradually relocated by various parties, and mauy of them have developed into great and paying mines. Sau Juan has since produced scveral million dollars. Miua Vieja, Percionera, Bustillos, Galdeano and othcrs are now producing many thousands each month. Recently El Potosi was repnrchased at the price of $250,000 by those who once abandoned it as worthless, and they have developed an ore body in it estimated to be worth $75,000,000.

Up to 1895, when the Americaus began au active development of the old mines, it is estimated that the camp, having a radius of less than 3 miles, had produced over $700,000,000. Some idca of its prodnction may be gained from the fact that the Chihnahua Cathedral and the old chapel at Santa Eulalia were bnilt at a cost of $900,000 exclnsively from the tax on the production of these mines during the early years of the eighteenth ceutnry. In about 1898 or 1899 diamoud drills were introdnced and large ore bodies were discovered at greater depth. A new era of mining began. The Mexicans nsed only the primitivc system of carrying out the ore on their backs and transporting it ou burros to their small furnaces uear by, and then, in their crude method, extracting the silver and other minerals.

The town of Santa Enlalia lies less than 1 milc from the base of the monntain, and here can be seeu the ruins of former great activities. Thc slag to the extent of huudreds of thousands of tons is positive evidence of the work of the miniature smelters.

General Lew Wallace, who visited the mines in 1868, is rcsponsible for the statement that at that time there were 188 of these small smelters at work in and abont the town.

Wheu one considers these facts and that 600 pounds of ore and flux constituted a charge, aud that the necessary heat was obtained by the use of a foot or hand bellows, one can appreciate the infinite amount of work it has taken, first to extract the ore and transport it to the town, and then to smelt it with these crude methods. And he will fnrther appreciate the vast extent of the ore bodies when he knows that the mineral belt was hardly 1 mile in length. Thns the work of operating these mines has dragged through many generations by these crude methods, so that to-day the camp is, as a matter of fact, practically in its infancy, as in most of the mines drifts have not been run below the 400-foot level; and when it is remembered that it has proven the almost nniversal rule in this camp that the grade of the ore improves with depth, we realize that the fnture production will probably snrpass the past. Santa Enlalia presents one of the most striking examples of secondary enrichment of ore bodies by downward passage of snrface waters.

CHARACTER AND GRADE OF ORE.—The greater part of the ore consists of a mixture of carbonate of lead and oxide of iron. This class contains from 10% to 15% of silica and a little lime. The carbonate ores run from 10% to 60% lead, and contain from 6 to 80 onnces of silver per ton.

The snlphide ores are richer and sometimes run very high in silver, as in the case of the San Jnan mine, where, for months at a time, the ore has run hnndreds of dollars to the ton. The greater portion of the ore in the camp is low grade, rnnning perhaps 20% lead and 10 to 20 ounces of silver to the ton. This ore, if in large bodies, will pay a good profit, for the Santa Enlalia ores are much sought after by smelters as fluxing ores, and command the best smelting rates.

The ores from the San Juan have averaged considerably more than this. Those from the Santo Domingo, El Potosi and Bnena Tierra, eveu in the large bodies, at a depth of 1000 to 1400 feet, run considerably higher than this, and yield a net profit of $15 to $30 per tou; while those at the 450 level of the Americau Smelting & Refining Co., and of Bueua Tierra, rnn about 10 ounces silver and 20% lead.

In the Hearst mine (Miua Nneva), I am informed by the owners, that their ore from abont the 1400-foot level paid them a profit of over $35 pcr ton.

R. D. Jackson, late Professor of Mining in the Universily of Nevada, made an examination of the camp and for some of the facts herein I am indebted to his report. While there he inspected the ore body on the 1300-foot level of El Potosi and says it is abont 800x600 feet in size.

A short distance east of El Potosi lie the claims of the Zubiate, 325 feet sqnare, and Coronel, 325x650, now beiug worked by thc Standard Oil people. Znbiate is repnted to have been one of the richest mines in the camp, despite its small size. Mr. Robinson says that a conservative estimate of Zubiate's production is between $40,000,000 and $50,000,000.

Conserving Water for Hydraulic Mining.*

Written for the MINING AND SCIENTIFIC PRESS by DENNIS H. STOVALL.

An excellent method for conserving water for hydraulic mining has recently been adopted by some of the larger sonthern Oregon placer mines. Those properties that derive their water directly from the main streams nsually are afforded an ample supply by the uatural flow duriug the winter months, bnt are required to close down dnring the summer ou account of the streams getting to snch a low stage as not to afford a fnll pipe-head.

The bnilding of reservoir dams has solved the problem, not only of a snmmer snpply, but also insures a steady and constant flow in the ditches. Snddeu freshets aud alternate dry spells and low water, which formerly resnlted in overflowing ditches, caves and slides, are held in check by these reservoir dams. By their aid the flow of water is kept constant and regular.

These reservoirs are different from those formerly in use by hydraulic mines, and still in use extensively, in that they are built at the head of the ditches instead of the mouth. They are not built to tnrn the water into the ditches, bnt are located ½ mile or more above the head of the ditch, and on the creek itself.

When the snmmer months arrive and instead of closing down the giants entirely, the dams are closed dnring the night and the reservoir allowed to fill. Eight or ten acres of watcr accumulates above the dam—enongh to supply two or more giants all the following day. In this way operations can be carried the whole year throngh, which is a big item to the euterprising placer miner, who fully recognizes the valne of utilizing every moment, for the greater the time the giants can be kept at work on the gravel bauks the greater will be the cleau-np.

The dam shown in the illnstration on the front page, is made of a donble tier of pine logs. These were cnt the right length, peeled and cribbed, and the cribs filled in with boulders and gravel, the whole being set firmly into either bank.

*See illustration on the front page.

THE next annual session of the Amcrican Miuing Congress will be held Angust 22 to 27, 1904, in Portland, Or.

Gold Mining in Nova Scotia.

Gold mining in Nova Scotia began abont the year 1860, and has not made rapid progress since that date. The annnal ontpnt has varied from 10,000 to 35,000 onnces, says the Canadian Mining Review.

The early operations were condncted with little skill, and some thirty years passed before the experience gained in other countries was applied to the provincial mines. At present several companies are working on business lines and getting good returns. Continnal losses, however, show that many have not learned the principles of legitimate mining.

Owing to the abandonment of every mine in the earlier days, as soon as the quartz fell below the high figure reqnired to yield profits, it soon became an nndisputed dogma that all Nova Scotia gold was shallow. The gold being free milling, no one tried to see if it still remained in the quartz and sulphides, if invisible. Mines were abandoned which to-day show no free gold, but enough in the metals to pay the carefnl miner. It may safely be said that for a long period iu Nova Scotia no assays were ever made, and it became a maxim that all ore was valneless unless the miner could see the gold in the quartz.

This fallacy has now been pretty well exposed, and tailings and concentrates receive considerable attention. Still the lakes, rivers and swamps have received thousands of tons of tailings, which represented in many cases handsome margins of profit.

The other axiom, the persistence of gold to shallow depths only, is dying hard. For years the capitalist iuvited to iuvest in our gold mines invariably objected, "Your mines carry gold only to limited depths," and there is no opening for investment. The criticism was trne as far as experience had gone. The dome shape of the Nova Scotia gold fields became known at an early date, with its intercalated qnartz bands radiating away from an anticlinal and sweeping round the dome of elevation. The veins were worked as they outcropped down as far as the gold held, to depths up to 500 feet. It appeared from the strnctnre probable that there might be veins nnderneath these not coming to the snrfacc and bending over the anticlinal. It was some time before this was proved by working.

The discovery at Bendigo, Anstralia, that a shaft sunk on the line of the anticlinal axis wonld cnt the crowns of such unexposed veins as they turned over the fold, led to a comparison with the strnctnre of the Nova Scotia veins. It may be said that the veins in Nova Scotia do turn over the anticlinal axis as in the Australian district referred to, but it may be qnestioned if the facts so far observed in Nova Scotia can be relied upon to permit of a prediction that the physical conditions of the strata here will reprodnce equally large aud rich vein crowns, or saddles and legs.

Any dictum as to the finding of gold at any particnlar point along the vertical plane of an anticlinal axis mnst be based on the rules governing the deposition of the gold. As yet it may be said this important point has not been studied in Nova Scotia.

It may be stated that the gold in the Nova Scotia veins was deposited before thc transverse foldings took place, and possibly to some extent later. There is presumably no proof that the gold came from ascending waters, as the lessening in thickness of the legs, with depth, wonld point to a line at which the strata were absolutely compact.

Inferentially the sonrce of the gold is to be fonnd in the rocks adjacent to the openings or loosened portions of the folds. These rocks, originally receiving the fold as an allnvium, wonld receive it with more or less irregularity. Hence cantion as to any positive assnrauce of any shaft in any anticlinal axis giving access to succeeding rich quartz bands.

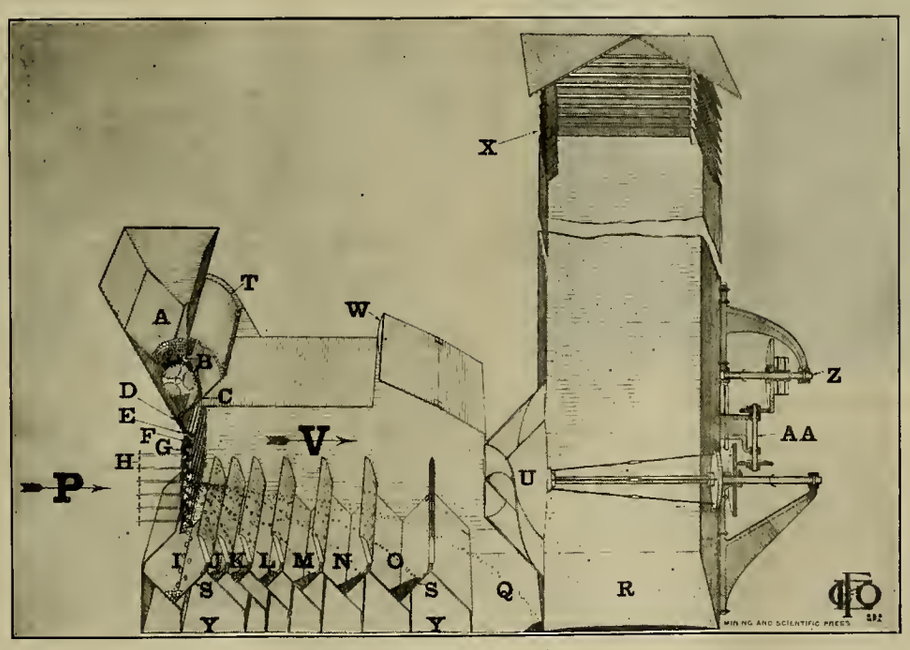
However, the analogy with Bendigo, Anstralia, is striking, and thc practical comparison seems to be fairly borue out.

For a number of years the Government of Nova Scotia has been importnned to sink a deep shaft and settle forever the question of the existence of gold at depths in this province. The only practical outcome seemed to be a preminm to the miner who found gold in depth, but it was difficult to see how any miner could do his share without some gnide as to location, etc.

Mr. Faribault, the geologist of the Canadian Geological Snrvey, having made for years a close stndy of the Nova Scotia gold fields, satisfied himself that the conditions here closely paralleled those of Bendigo, and the life of the indnstry warranted the test of the pick. His advocacy of this view inspired the bolder miners of the province, and they seem to have so far proved the correctness of his reasoning. The Government was now enconraged to believe that it saw a reasonable ground for action. The gold fields, if they could be proved to be capable of systematic development, offered, owing to their great extent, a source of revenne greatly exceeding that derivable from coal, and the Government appears willing to veuture again. In order that the public interested in this snbject might be informed, they procured from Mr. Faribault a report embodying the conclnsions he has arrived at. This report gives im-

portant suggestions. He urges that aid should be given to vertical shafts sunk close to the antielinal axes, so that the apices of veins in the richer zones should be intersected and their legs be tested by crosscuts. As far as mining developments have been carried, his advice is good.

The Government recently passed legislation pledging itself to subsidize the sinking of shafts already 500 feet deep, provided they are properly located, if the owners are ready to go to greater depths.



In these notes no reference has been made to fissure veins. There are a number of these in the province, some of which have yielded good returns. Mr. Faribault contends from the standpoint of his theory of the intercalated veins that the permanency in depth of the gold contents of the fissure veins is a matter already so well thrashed out in other countries that no special government attention is needed as far as they are concerned.

This point of view is, again, connected with the source of the gold, but every one acquainted with the gold fields of the province will agree that the interests involved in the development of the intercalated veins as to number, etc., is greater than in the case of the comparatively limited number of fissure veins heretofore opened. Under the head of the fissure veins may be classed the hitherto little known auriferous veins and deposits of several other old geological horizons of the province.

Freid Gravity Dry Process Separator.

Written for the MINING AND SCIENTIFIC PRESS.

The accompanying illustration is an isometric-perspective view of the Freid gravity dry process separator, in which the principle of separation is gravity and deflection. The deflecting action is caused by a non-cavitating balanced screw propeller, placed at the end of the action chamber, which creates a partial vacuum in the chamber, and allows the small or lighter to deflect from the larger or heavy particles as the material which is to be separated falls on the line of gravity, which is on the perpendicular plane of the staggered baffle plates, as shown at the end of the action chamber opposite to the propeller. The entire area of the action chamber proper is left open, and the baffle plates arranged as shown, in this manner allowing atmospheric pressure to lay uniformly against the entire opening of the chamber and the perpendicular gravity line.

Freid Gravity Dry Process Separator.

The material which is to be separated is delivered in the hopper indicated by the letter A, and is fed through opening B, at which point the stream is regulated by a gate and agitated by a roll, the gate being raised and the roll caused to revolve at a speed suitable to feed a given quantity of material per hour. The material falls on dead plate C, slides off this plate and falls on cleaner plate at D. The cleaner plate has an angle turned up at E, where the material builds up on this turn-up edge and overflows, dropping on baffler F, and accordingly builds up to its natural angle of repose, overflows and drops on baffler G. While dropping off this baffler a horizontal opening H allows atmospheric pressure to rush into the action chamber V. The material following this arrangement of bafflers on the line of gravity to the bottom of the opening of the action chamber over which atmospheric pressure indicated by large arrow and letter P deflects the light from the heavier or the small from the larger particles of material so treated. The heavy or larger finally finds its way to compartment I and the light or smaller particles are deposited in O, N, M, L, K and J, according to their respective weights and sizes. The product in these compartments is discharged automatically through gates S and is delivered to suitable chutes or conveyors at Y. The curved plate T, which is hinged to the dead plate C, is for the purpose of preventing any spill at the roller feed.

The deflecting action is caused by the balanced non-cavitating screw propeller U, which creates a partial vacuum in the action chamber V, and the valve S controls the pressure at P. The louvered arrangement X at the top of the settling chamber R is to allow atmospheric volume to exceed the openings H at the bafflers. This causes the light particles to settle in the chamber R. The driving mechanism is arranged to allow minute change of speed of the propeller, and is driven by direct coupled motor, by means of flexible flange couplings at Z, or belt from motor or line shaft to loose and tight pulley, as shown. By adjusting counter drive A A the speed of the propeller U can be changed from 120 revolutions per minute to 1600 revolutions per minute. By this arrangement the action in the chamber V is controlled, making it possible to separate or concentrate material from 0.5 to 22 specific gravity.

Mr. Freid, the inventor, deemed it necessary to conceive a means whereby an absolute uniform action could be constantly created over the entire mass of material. The non-cavitating balanced screw propeller is a development of previous research made by Mr. Freid regarding marine propulsion. He claims that, as the propeller is readily controlled regarding speed or displacement of volume, the action at the baffle plates on the gravity line can be regulated so that a reduction of ore passing ½-inch ring and finer, up to 200 mesh, would be separated by deflecting the light or smaller from the heavy or larger particles, in the first separator of the mill unit the action to be so regulated as to hold the fine values in the separator, not allowing them to pass the propeller and tail off to the dump, the action of the second separation in a mill unit regulated to treat the concentrates from the first machine, and so on, as shown in the diagram.

Mr. Freid has a demonstrating laboratory, wherein he has a full unit of the separator, which is used to demonstrate the commercial value of his process.

Detection of Adulteration in Cement.

Portland cement is defined as a product obtained by firing to sintering a mixture of limestone and clay; the product is very finely ground after the firing, and has the property of setting hard with water, says Slate and Cement. It may contain 2% of gypsum. Its composition should be: Lime, 59–56%; silica, 20–26%; oxide of iron and alumina, 7–14%; magnesia, 1–3%; alkalies, up to 3%; sulphur trioxide, up to 2%. As many substances can be added which affect the properties of the cement without altering its percentage composition, R. and W. Fresenius suggested the following limiting values: Minimum specific gravity, raw, 3.00; ignited, 3.12; maximum loss on ignition, 3.4; alkalinity of aqueous solution of 0.5 gramme, 7.2 c.c. of deci-normal acid; permanganate reduced by 1 gramme, not more than 2.8 milligrammes; magnesia content, not more than 3%. Now that blast furnace slag is used in the manufacture of cement, these limits no longer hold, for a cement may be made from slag which shall be quite normal in these respects. The permanganate measures the sulphide-sulphur present, but if there be much sulphur, some may escape as hydrogen sulphide during the titration. This may be avoided by addition of excess of permanganate and back titration, but the limit must in that case be altered, for normal cement so treated may require 6 milligrammes of permanganate. Instead of permanganate, the author now recommends addition of excess of arseuious acid, in hydrochloric acid solution, which precipitates the sulphur as arsenic trisulphide, and back titration; or two titrations with permanganate, one direct, the other after removing the sulphur as cadmium sulphide.

Normal cement should not contain more than 0.15% of sulphide sulphur, while one made with admixture of ground slag may contain 0.8%. This limit, however, may be found in the centrifugal separation, and examination by permanganate or arsenious acid, of the constituents of the slag of different specific gravities.

Ecuador and Peru.

Written for the MINING AND SCIENTIFIC PRESS by F. W. CARNAHAN.

Ecuador was created into an independent State owing largely to the slow means of communication then (and now) maintained, as between Bogota and Quito, on the one hand, and Lima and Quito, on the other. Peru, as it exists to-day, is the remnant of Pizarro's domain, retaining the capital, which he founded. Quito is an ancient seat of the Incas, and probably of their predecessors. Prescott's "Conquest" is the only recognized history of Peru, so said a Peruvian. Ecuador has history. Wolf's works are accepted as the standard source of information about Ecuador. Each of these countries has recently completed new railway mileage, and it will be admitted that this fact alone may lead to results of importance to the mining and metallurgical interest. One thing not disputed is the wide extent of the land lying just beyond these railways, and which practically contains no white men. There are, of course, sporadic instances where white people enter and dwell in this forest.

Certain indigenous tribes and a large proportion of the visitors prospect for placers. It is rare, indeed, that a party prepared to make any test further than panning traverses any part of the interior. In Ecuador a variable small amount of gold each year finds its way to Quito. Ten thousand dollars will likely cover this amount, mainly, it is said, from the Napo river. A jeweler in Gualaceo had an order for a gold ring while our party was sojourning there. He said that he had secured one ounce a week or so before from the Sig-sig Indians, and doubted if they would have another ounce so soon. Gualaceo is probably not the only market for the Sig-sig output. The larger city of Cuenca would logically secure more than Gualacco, and, beside, it would be more in line with what we conceive the Indian habit to be for them to distribute the gold as widely as possible. Taking account of all this, however, our impression remained that the product of the Sig-sig placers is unimportant. I saw a little gold dust brought out from the province of Esmeraldas. The man who secured it there said that one trader held at that time $4000 worth of dust which he saw. The Playa de Oro Mining Co. recovered a considerable amount of gold in the same vicinity a few years ago. Of my own personal knowledge I saw gold produced in the province of El Oro only. Here is an important system of veins, since visiting which I am inclined to hear with attention reports of other promising showings in that neighborhood.

In Peru, Casapalca is an important mining and metallurgical headquarters. Cash is paid for ore by the smelter at this point; ordinary charge, 100 tons per day. Practically all the material here run into matte is the product of ore-dressing plants, briquetted. The high price of fuel bars out ore carrying under 20% copper.

In Cerro de Pasco were several small establishments and stacks in operation. As elsewhere in Peru, matte is the product. Santa Barbara and Yauli also support matte furnaces. Llama droppings are utilized as fuel. This material yields an intense heat. There is also some coal found, but, so far as developed to the present time, the supply is precarious and the quality doubtful. Petroleum is a product of the Peruvian coast, largely employed in the roasting operations at Casapalca. Near Oroya occurs a fuel of the asphalt series. In appearance it differs little from the limestone which almost universally caps the formation in that portion of the Inter-Andine valley. I am not aware that this material is utilized. In the vicinity of Chimbote are said to be extensive anthracite exposures. In the progress of time it is possible that the fuel supply of Peru will be drawn from Chimbote. It may be another century will elapse before the unparalleled feat of crossing the Peruvian Andes with a railroad will be again attempted, and until this is done from Chimbote, we may regard Callao as a promising point for development of smelting.

There is one installation of stamps—100, I believe—

some 5 or 6 leagues north of Cerro de Pasco. The operatious here are reported to be satisfactory to the owners, mainly English.

The mining laws of Peru, and these are apparently the model for those of Ecuador, are worked out in great detail. Foreigners have rights equal to native born. In acquiring property there, however, it will be well to iuvestigate the status of any drainage tunnel in the viciuity with the same care that should apply with reference to tunnel rights in the United States.

An Ice Palace.

In some of the mining districts of Colorado the altitude is so great that the temperature is always below the freezing point of water. In some of those high altitudes the water in the rock is frozen throughout the rock mass. Some years ago, at one of the large mines in this high region, a gravity tramway was installed. The descending buckets carried ore and the ascending buckets each carried a stick of cordwood, which was used for steam making at the mine and also to thaw out the rock faces in the mine. The accompanying illustration is that of a stope in the Last Chance mine, in Park county, Colo., and is called the Ice Palace. This formation of ice is due to the freezing of the moisture as it exudes from the rock walls of the excavation. Its general appearance is not unlike a cave in which stalactites and stalagmites have formed from the crystallization of calcium carbonate, in caves and sometimes in ore chambers, as illustrated in an engraving on the front page, which occurs in a mine at Santa Eulalia, Mexico.

Ice Formed in Stope in Last Chance Mine, Park County, Colo

Treatment of Telluride Ores at Kalgoorlie, Western Australia.*

NUMBER IV.

Written by W. E. SIMPSON.

AGITATION AND FILTER PRESSING.—Every particle of the ore is eveutually reduced to slime and sent to the agitator vats. Of these there are four, each 20 feet in diameter and 7 feet deep, and fitted with mechanical stirrers making eight revolutions per minute. It is here that the pulp is tested and the solutions brought up to working strength—.04%—by the addition of solid cyanide. The solutions are always to be found strongly alkaline from the lime present in the wasted ore.

Seven hours are usually occupied in filling a vat, then ten in continuous agitation, after which the pulp is ready for filter pressing. The fact that the solutious are always hot, ranging in temperature from 120° F. when entering the tailings wheel to 80° when leaving the agitators, may have something to do with the rapidity of the extraction. Each vat holds 20 to 25 tons of dry slime mixed with 40 to 50 tons of solution, and for agitation requires about 3 H. P. From these agitators the pulp is allowed to discharge through a 4-inch plug cock in each, iuto one of two montejus, vessels resembling large egg-ended boilers set up on end, and from these it is forced by compressed air into the filter presses.

Four filter presses are in use on the Boulder Main Reef, each containing forty-eight slime cells. The cakes obtained are 40 inches square by 3 inches thick and weigh on an average 220 lbs. moist or 182 lbs. dry, so the complete press contains 3 tons 18 dwts. of dry slime. Each of the presses is filled and discharged twice per shift of eight hours. The rich solution resulting from the filtration of the pulp is forced by a plunger pump through a small clarifying press, and passes on to the precipitatiou boxes. The cakes or residues are washed, first with weak solution, under 40 lbs. pressure for an hour, theu with water, and are finally dried by blowing compressed air through them for a few minutes. The press is now opened and cleaned out, and the residues are trucked to the dump. The moisture still left in the cakes varies from 18% to 24%, and appears to be in a state of chemical combination, as no amount of mechanical effort cau appreciably reduce its quantity. A considerable degree of heat is required to expel it completely.

The pulp from roasted ore is passed through a filter press with more difficulty than that from the raw slime, as the action of the hot saline solutions soon hardens the filter cloths and makes them less porous, consequently the presses take louger to fill. For the same reasou the washing with water is less effective, and the amount of air consumed in drying is slightly greater. The roasted ore, however, is finely granular, and consequently is exceedingly porous. The washing of cakes a foot thick presents no greater difficulty than is uow experienced with those only 3 inches. But the great drawback is that a 12-inch cake will weigh nearly 8 ewts., and this is far more than a couple of pressmen can handle efficiently.

Up till quite receutly montejus alone were used for charging the filter presses. They are convenient, as the compressed air is easily regulated, and gives a steady pressure, free from all jar or percussion, on the presses, and thus do not cause leaks, but compressed air is expensive. Triplex pumps are now being installed at many of the mines. They are much cheaper in operation, but have some disadvantages, the weak point being the packing rouud the plungers. This appears to be unable to stand the highest working pressure—viz., 120 lbs. per square inch, and is constantly blowing out. The slime also works up about the glands, and the plungers become so much scored that they will probably have to be replaced frequently. An internal jet of cyanide solution might be used with advantage, but its introduction would always mean so much dilution of the pulp. Pumps also cause jars in the presses and so lead to leaks, and an even greater apparent disadvantage of pumps is the liability of obtaining a diminished extraction of gold owing to the lack of effieient aeration of the press charges.

As the operation of charging proceeds the press becomes filled, the filtering area diminished, and eonsequently the capacity for receiving pulp is gradually lessened. It is therefore necessary that the rate of delivery to the press should be correspondingly reduced—in other words, the speed of the pump must be gradually reduced. The best pump would appear to be one driven by the electromotor, regulated by a switch which would automatically reduce the speed as the press filled and as the pressure on the plungers increased.

On the Boulder Main Reef the air from the montejus, which has just charged a press, is exhausted into its pulp-filled neighbor, thereby making it unnecessary to use the compressor except for the end of the charging process. The residues are discharged from the presses through chutes into trucks underneath, and these are drawn out to the dump by horses; but the tendency is to supersede the truck as far as possible by the Robins belt conveyor, and the horse by the electromotor. There seems to be a splendid opening for a filter press which could be discharged by some simple mechanical means; for instance, it might be possible to sluice out the cakes with water, and run the resultant pulp into reservoirs. This would reduce the labor cost to a minimum, diminish the wear and tear by rendering it unnecessary to be opening and closing the presses continually, save the filter cloth, dispense with the use of compressed air for drying, set free the obligation of limiting the thickness of the cakes to sizes which can be easily handled, and probably bring down the cost of filter pressiug to one-half of what it is to-day.

The cleanup is performed in the usual way—viz., treatmeut of the precipitate with sulphuric acid, filter pressing, roasting, or rather drying the bullion slimes, and smelting with borax or other flux.

On the Boulder Main Reef the gold from the amalgamation and that obtained by cyanidiug are melted together, and an analysis of the bullion obtained on June 3, 1903, was as follows:

Gold	71.73%
Silver	25.65%
Copper	00.91%
Iron	00.82%
Zinc	00.89%

On all the larger plants the tilting furnace is iu general use for melting gold. It is a cast iron box lined with firebrick, and mouuted ou a pair of trunuions like the Bessemer converter. The crucible—or "retort," as it is called—is bricked iu with the lining, aud rests on a firebrick arch a few inches above the fire bars. Wheu the charge has to be poured in the whole furuace is tilted over by means of au endless screw aud worm wheel, and the molten metal is discharged iuto moulds or other convenient receptacles. With this furnace 10,000 ouuces of "bullion slime" from a cleanup of a cyanide plant can be melted iu from twelve to sixteen hours. The crucible itself will last for two runs, and costs in Kalgoorlie £12.

The advautages of this contrivance are numerous; its capacity is great, the crucible remains undisturbed and embedded in the hot fuel during the whole of the meltiug; no heat is lost in pouring; the crucible mouth is outside the furnace away from the fierce draught, and therefore uo fine bullion dust can be drawn into the flues and the loss by volatilization is at a minimum. These are all matters of great importauce, deserving serious consideration.

The Taverner process, so successful in South Africa, has been tried ou a small scale ou several of the Kalgoorlie mines, but has invariably given lower results than those obtained by the ordinary method. The reason of this is probably that the loss of gold in cupelling lead bullion is greater than in simply melting "bulliou slimes." The material dealt with in Kalgoorlie is very much richer than that which is usually met with in South Africa, for it often contains 60% to 70% of fine metal.

LABOR.—The amount of labor employed ou any plaut depends on its size. A millman is required per shift no matter what be the tonnage treated. On the large dry crushing plants it is found that one man per shift can attend to the running of six ball mills or ten Griffin mills, one can do the firing of six Edwards roasters, and it takes auother to attend to the amalgamating pans or flint mills. Two pressmen can, per shift of eight hours, discharge about thirty tons of residues, and oue man is required to see to the charging and washing of the presses. In Kalgoorlie the minimum wages for any kind of unskilled labor is 10s per shift; furuace men, filter press hands, boilers, stokers, etc., receive 11s 8d, eugine drivers 13s 4d to 15s, and mechanics, carpenters, bricklayers, and other tradesmen 15s to 16s 3d per shift of eight hours.

EXTRACTIONS AND COSTS.—Comparisons of costs for different plants are difficult, as no two mines use precisely the same process, or treat the same tonnage, and there is no uniform standard cost sheet on the fields. Ou the Boulder Main Reef, during the year 1902, there were treated 22,284 tons of ore with an average assay of 16 dwts. 8 grs. fine gold per ton. Of the gold contents, 92.2% were extracted at a cost of £1 3s 9d per ton for treatment. During the half year ending June, 1903, this percentage of extraction has been maintained, even with ore of lower assay value, and the cost has been gradually reduced until it now stands at about 18s. The eonsumption of cyanide averages slightly under 1¼ pound per ton treated.

Peculiar results are often observed in treating the Kalgoorlie telluride ores. Thus, in the dry process, it has been noted occasionally that excellent extractions have been obtained when the roast was so foul that the ore leaving the furnace was actually buruing blue. The consumption of cyanide, however, as might be expected, was very great.

In the Diehl process, on more than one occasion, a charge of sulphuric acid has accidentally been run in with the pulp into an agitator vat, in mistake for cyanogen bromide, and the agitation continued for some time before the error was detected; and it was

*Abstract Trans. Institution Mining and Metallurgy.

found that the extraction from that particular vat was distinctly better than that obtained from the rest of the pulp under treatment.

The addition of small quantities of zinc sulphate (spent clean-up liquor) to the working solutions is utterly opposed to all theory of cyaniding; but the value of the salt as a precipitant, when soluble sulphides are present, is now generally recognized.

The Diehl vats are all covered in, to the complete exclusion of atmospheric oxygen, which seems in direct defiance of the ordinary run of cyanide practice; but then the cyanogen bromide, added during the agitation, is in itself a powerful oxidizer, and more than makes up for any lack of aeration.

(TO BE CONTINUED.)

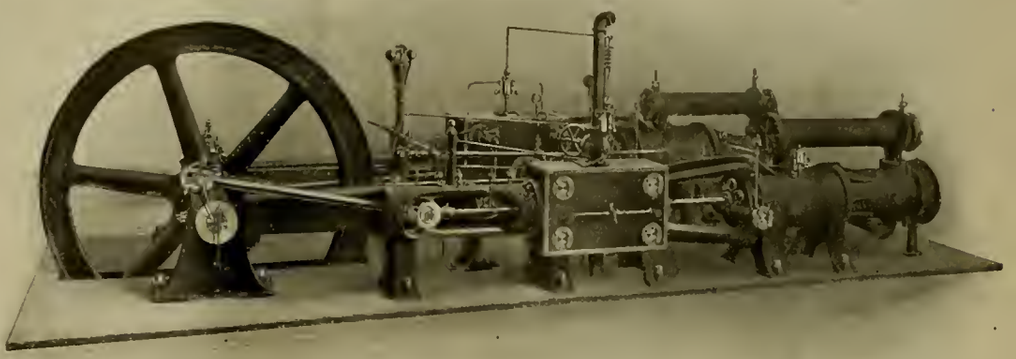
Mining and Milling in Mojave Desert, California.

TO THE EDITOR:—The desert region, from an economic standpoint in regard to mining, has a number of disadvantages that militate against the profitable extraction and reduction of low grade ore, as compared with more favored localities. The scarcity of water, fuel and timber, and in some cases an entire absence of same, increases the cost of mining and reduction to such an extent as to render the mining and reduction of low grade ores unremunerative. The last named conditions obtain at Randsburg, Kern county, Cal. In the following extract from the monthly report of the Yellow Aster M. & M. Co. it will be seen that low grade ore—from $3.50 up—can be made to yield a good profit under proper conditions. The above-mentioned mine is equipped with two mills—one of 100 and the other of 30 stamps—reducing on an average 500 tons of ore per day. Although within a distance of 2 miles of the terminus of the railway, freights are high, as will be seen from the prices of supplies, a few of the important ones being: Fuel oil, 4¼ cents per gallon; lumber, $32.50 per M.; other supplies in proportion. Water is obtained from two wells, sunk to depths of 450 and 300 feet, respectively, at a mean distance of 6 miles from mine and mill, at an elevation of 1500 feet below point of delivery. On account of the strike declared against the company June 10, 1903, the mine remained closed until September 1st following. Since that date the mine has been in operation steadily to its full capacity with non-union employes. The following is the scale of wages:

Miners, 9 hours	$3 00
Muckers, 9 hours	2 50
Car men, 9 hours	3 00
Timber men, 9 hours	3 50
Amalgamators, 12 hours	4 00
Stationary engineers, 12 hours	4 00
Hoisting engineers, 8 hours	3 50
Pump men, 12 hours	3 50

EUGENE H. BARTON,
Supt. Yellow Aster M. & M. Co.

	YELLOW ASTER MINE. 14,601 TONS TREATED.			From Nov. 1 to Dec. 1, 1003. Total disbursements, $30,183.06. Total cost per ton, $2.067.
	Total expenditure.	Expenditure.	Per ton.	REMARKS.
ORE EXTRACTION	$17,656 40			
Labor		$10,696 69	$0 73206	Miners, muckers, car men, ship bosses, etc.
Timbering		803 55	05500	Timber men, framers and assistants.
Timber		2,661 47	18228	8x8, 6x8, 2x12, Oregon pine.
Powder		580 68	03977	
Fuse		93 90	00643	
Caps		44 97	00308	
Lights		306 96	02100	Candles, electric and oil.
Blacksmithing		498 32	03414	Tool dressing, horseshoeing, car repairs, etc.
Development		628 72	04306	Hoisting, tramming powder and incidentals.
Haulage		643 90	04410	Drivers, mules, feed, etc.
Hoisting		607 02	04780	Tons hoisted, 6900; cost per ton, $0.1012.
Totals		$17,656 40	$1 20872	
MILLING	$5,981 69			
Power		3,340 70	22880	Attendance, fuel, maintenance, etc.
Labor		1,123 40	07604	Amalgamators, foreman, etc.
Rock-breakers		674 67	04620	Attendance and repairs.
Shoes and dies		538 79	03690	
Repairs		256 53	01757	General repairs.
Mercury		47 60	00326	Total cost, exclusive of water, $0.40067 per ton; .0815 ounce loss per ton.
Totals		$5,081 60	$0 40967	
WATER	$3,220 09	3,220 09	22053	Total cost, including water, $0.63020 per ton.
Totals		$3,220 09	$0 22053	Pumped 6½ miles against 700 pounds pressure at a cost of 19 cents per 1000 gallons.
GENERAL EXPENSES	$3,325 88			
Miscellaneous		1,460 10	10000	Including taxes, insurance, interest, expressage.
Assaying		160 61	01100	Assayer, fluxes, fuel, etc.
Salaries		950 87	06507	Superintendence, engineering, etc.
Tailings		313 33	02146	Impounding tailings and water.
Incidentals		440 97	03020	Office expenses, legal telegraphing, livery, etc
Totals	$30,183 96	$3,325 88	$0 22773	



THE mineral now known as topaz was not the original topaz, for that name was applied to the gem stones now known as peridot and chrysolite (olivine). The topaz of to-day was not formerly recognized as a distinct mineral. The prefix "oriental" before the name of some stones gives the name a different significance. Thus, oriental topaz is a variety of sapphire, and oriental ruby is different from the common ruby, the former being a beautiful red sapphire of great value and the latter is commonly known as spinel, a magnesian-aluminous oxide.

THE price of the newly-discovered metal, radium, which has been quoted at a fabulous figure, is now said to be worth only $2000 per gram. The demand for radium is said to be chiefly for medical purposes.

A Four-Stage Air Compressor.

Written for the MINING AND SCIENTIFIC PRESS.

The compressor illustrated herewith was built by the Sullivan Machinery Co. of Chicago, Ill., for the Oliver Iron M. Co., or the United States Steel Corporation, and was recently installed at one of their largest mines at Norway, Mich. It consists of a cross-compound, condensing Corliss engine, built for 150 pounds boiler pressure. A reheating receiver is placed between the high and low pressure cylinder. This receiver contains a reheating coil for reheating the steam during its passage from the high to the low pressure cylinder, a feature that is essential to the economy of engines of this type, especially in connection with a compressor, as it is sometimes running at a very slow speed, and without a reheating device condensation would be very great. The cylinder lagging is made of heavy steel plate, and a space of from 4 inches to 5 inches is allowed inside of this lagging for magnesia covering. The lagging around the cylinder, resembling a square box, is filled with this non-conducting material, so as to prevent losses by radiation.

Four-Stage Air Compressor.

The compressor was built entirely of semi-steel, this metal being much stronger and denser than ordinary cast iron, and all of the wearing parts will, therefore, it is claimed, wear much better than if soft cast iron were used. The weight of the machine is also reduced to a minimum, on account of the great strength of the material.

This class of machinery is heavy, and, in most cases, has to be transported thousands of miles through parts of the country where the freight rates are high, and the saving in freight between a machine that is built of the strongest kind of metal and one that is built of soft, inferior metal is considerable, as the difference in weight is stated to be nearly 25% between the two. Another loss that must be constant, as long as the machine is in operation, is the power required to keep in motion an unnecessarily heavy, unwieldy machine. The poorer the material, the heavier the revolving and reciprocating parts of the machine will have to be, and the energy required to keep it in constant motion, and to overcome the friction of these heavy parts, will be much greater than that necessary to keep these parts in motion when made of lighter, stronger material. The cranks, crank shaft, connecting rods and piston rods are all said to be made of the best grade of steel procurable for this purpose. All motion rods and pins for the valve gear are made of steel, and all boxes and bearings for the valve gear are made of phosphor-bronze, and are adjustable for wear. The piston rods are packed with metallic packing. Sight-feed lubricators are provided for the low and high pressure steam cylinders. The governor operates the Corliss valve gear in combination with the air pressure. The fly wheel is made sufficiently heavy to maintain a uniform speed at 10 R. P. M. This compressor was built for an air pressure of 1200 pounds, and is of the four stage type, with the air cylinders so arranged that the work done in the high and low pressure steam cylinders is nearly equal. The four cylinders are single acting. In the intake and second cylinder, where the air pressure is lowest, it is compressed against the front heads. In the third and fourth cylinders, where the pressure is the greatest, the air is compressed against the back heads of the cylinders. In this way the use of stuffing boxes and piston-rod packing under the heavy pressure has been avoided.

Concerning its operation, the manufacturers say: "The pistons in the intake and second cylinders are of the adjustable bull-ring type. This kind of pistons are also used in the engine cylinders. The pistons in the third and fourth cylinders are made in the shape of a straight ram or plunger, and fill the cylinders their entire length. They are also provided with a special spring packing. Special provision is made for the lubrication of these pistons, and, in view of the fact that they fill the cylinders their entire length, the air cannot leak past them. The suction valves in the intake and second cylinder are mechanically moved. The discharge valves of the intake and second cylinder are of the poppet type and of the following design: The valve and valve seat are located inside of a removable cage, and held in place by hand-hole plate. When this hand-hole plate is removed the valve cage containing the valve and seat can be removed from the recess in which they are located with bare hands, without even the use of eyebolts. The pressure of the hand-hole plates forms a tight joint between the cylinder head and the valve cage. By this method we avoid making the valve seats against part of the cylinder head, which is so annoying to keep tight when the seat becomes worn or leaky, when the loose cage valve and all can be removed; a spare valve and cage can be kept on hand to put in its place when taken out. It can then be ground and fitted, and be ready to take the place of the next one which becomes leaky. By using a spare valve seat and cage one can be taken out and changed each week, if required, as it requires no longer to make the change than the time required to remove the three nuts that hold the hand-hole plates in place. By this method these valves can be kept tight at all times. Where part of the cylinder head forms the valve seat, several grindings will destroy the proper shape of the seat to such an extent that when a new valve is inserted it will not fit the seat properly. The consequences are leaky valves and valve seats ever after. The suction and discharge valves in the two high-pressure cylinders are of the poppet type. The valves are made of nickel steel. The recess in which these cages are inserted are tapered, and the outside of the valve cage is ground to fit in these tapered recesses. The cages fit on their outside their entire length, or the thickness of the head, as it is not advisable to depend on a narrow joint or shoulder for an air-tight fit under so heavy a pressure. With the smallest amount of leakage across a joint of this kind, with so heavy a pressure, it would soon cut away the metal, and a very small leak under 1200 pounds pressure would impair the efficiency of the machine enormously. With these cages fitting their entire length, and ground to fit like a plug cock, all

danger of leakage or cutting away the metal with the high pressure is eliminated. The poppet valves in all of the cylinders are cushioned, so that they work without noise or clicking. The water jackets arouud the intake and the secoud cylinders are so designed that a body of water 3 inches in thickness circulates around the cylinder liners. The amount of water space around the third and fourth cylinders varies from 4 inches to 6 inches between the outer shell and the cylinder liner, which allows for the free and unrestricted circulation of cold water around the cylinders. The liners in the air chambers are independent of the cylinder castings, and are pressed into the outer shells with hydraulic pressure, so that in case of cutting or scoring from lack of oil, either one of these liners can be removed and new ones inserted in their place. If the cylinders and the liners were cast in one piece and the water jackets cored out, the cylinder would have to be rebored in case of cutting and a new piston made, or else the entire cylinder must be thrown away and a new one purchased in its place, which is more expensive than a new liner. The air enters through the mechanically moved intake valves in the front end of the forward air cylinder, located behind the low pressure steam cylinder. When compressed, it is discharged through the pipe shown on the side of the cylinder into the first intercooler, located below the floor line. From this intercooler it is taken into the second cylinder, located on the left hand side of the machine nearest to and behind the high pressure steam cylinder. After this second compression it passes through the intercooler located on top of the second and third cylinders, and the third stage takes place after passing through this intercooler. It is then discharged through a pipe passing under the floor line from the third cylinder, and enters the intercooler located on top of the intake cylinder, on the right hand side of the machine and the fourth cylinder. This intercooler is separated into two compartments, so that the air travels in the shape of a loop through the intercooler tubes, and it is drawn into the fourth or final cylinder, where it is compressed to a pressure of 1200 pounds to the square inch. The front end of this intercooler is merely resting on the upper side of the intake cylinder. There is no connection between the intake air cylinder and the intercooler. Copper is used exclusively in the intercoolers for circulating tubes for the cold water. The arrangements of the copper tubes in the intercooler is such that they are free to expand and contract from heat and cold without affecting the joints, so the expansion and contraction can take place without causing leakage. The speed of the machine is automatic, and varies automatically from 10 to 125 R. P. M. An automatic air governor acts on the automatic cut-off mechanism of the valve gear, and the speed is automatically increased and decreased, according to the amount of air used. In order to economize on the foundations the third and fourth cylinders may be built overhanging from the ends of the intake and second cylinders. The foundation may terminate at the back ends of the first and second air cylinders. A pedestal may then be located under the rear ends of the third and fourth air cylinders, and a cast-iron plate, on which these pedestals rest, bolted to the floor. The pedestals themselves however, are not bolted in this case, so as to allow for the expansion and contraction of the metal of this part of the compressor taking part without hindrance."

Notes on Classification.*

NUMBER II.—CONCLUDED.

Written by T. LANE CARTER.

It is believed that this slimes escape gate is an improvement on the former method of putting the slats in as required. The kaffir in the tank generally has the faculty of getting them in crooked and allowing pieces of blind to get in between the slats, causing an aperture through which the sand escapes.

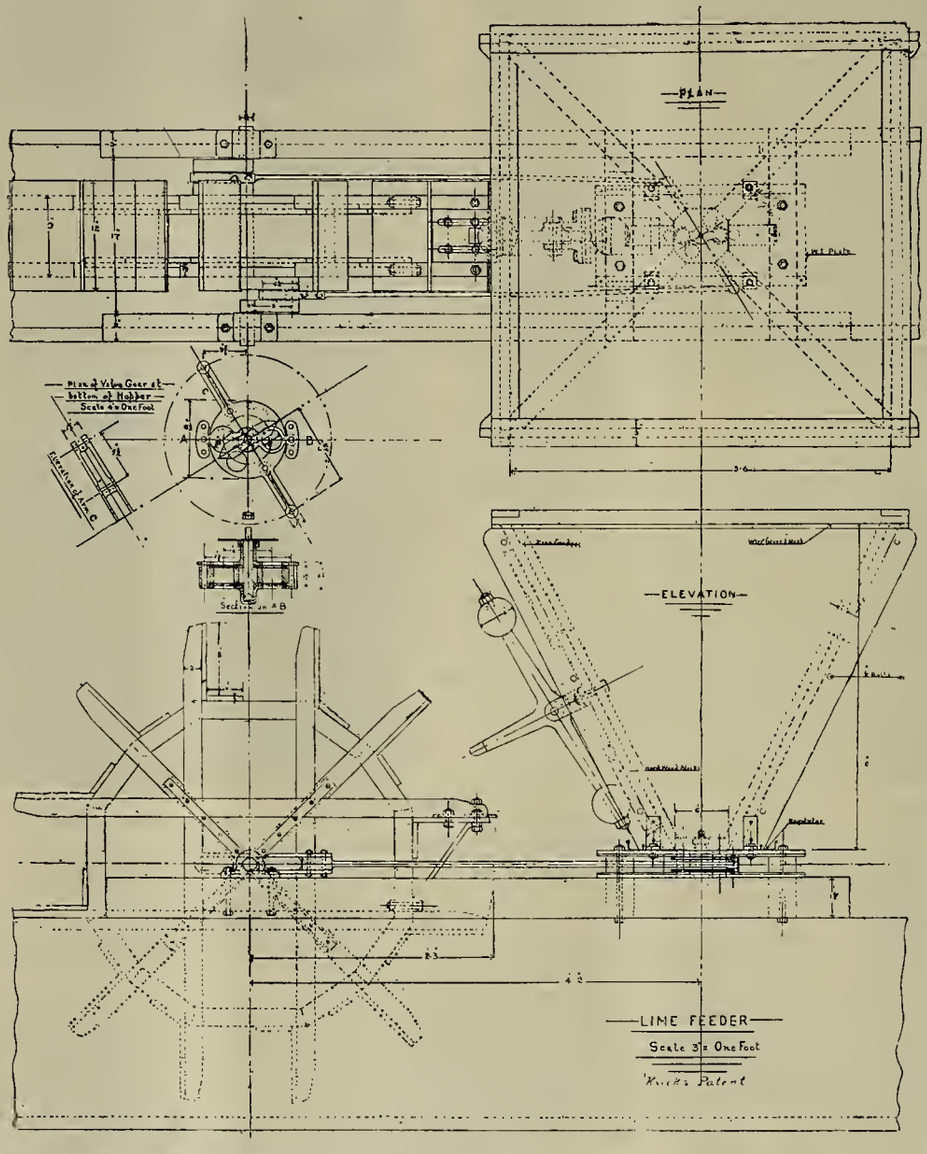
Another successful scheme for providing for the escape of slimes from sand tanks is to have heavy iron slats without a blind of any kiud.

There would be a higher extraction from sands if the rich sulphurets found with sands could be kept in the concentrate tanks and more of the coarse sand now in concentrates could mix with the sands, forming a more amenable product. The following figures are the averages of assays carried out to investigate this point:

Average residues of sands = 1.05.

3.73% concentrates from these residues assayed 14.1 dwts.

96.27% sands from these residues assayed .57 dwt.



Showing conclusively that the larger proportion of the gold in a residue is in the sulphurets and the very coarsest of the sand. If, therefore, the 3.73% of concentrates could have been kept out of the sands tauks the average assay values would have been .57 dwt.

Much has been said regarding the tank capacity of a cyanide plaut, and it is, indeed, true that the tank capacity of the average plant is underestimated. A simple plau has occurred to us for increasing the treatment capacity on a plant with top and bottom tanks. For instance, on a 200-stamp mill the cubic sand tank capacity is 201,060 cubic feet, which is made up of 100,530 cubic feet top settlement tanks and 100,530 cubic feet treatment tanks. Now, on most plants top treatment has been abandoned. It is evident, therefore, that, except for the purpose of having one tank over the other, this enormous settling capacity is unnecessary. Why not allow 2-5 of this tank space remain for settlement, and remove the other 3-5 to the level of the lower tanks? The installment of a belt conveyor to carry the sand from the settlement tanks to the treatment tanks would be a simple matter and of no very great cost.

Slimes: The treatment of slimes is comparatively new among us, but great improvements have been made, and the extractions from same are gradually increasing. Perhaps different and less costly methods will spring up, but the chief method at present is the decantation process.

For the successful treatment of slimes it is essential to prevent fine sands and float sulphurets entering the slimes treatment tanks. This is easier said than done.

To a great extent the saud escaping from sand tanks is kept from the slime plant by means of a re-

turn spitzkasten to the tailings wheel. The secret of success is to have the spitzkasten sufficiently large to allow the fine sands to settle. On many plants the dimension of this spitzkasten is totally inadequate, and much incouvenience is caused by not having sufficient fall-back to the wheel.

It is often a good plan to have two spitzkasten working either in tandem or abreast, both discharging into the same launder.

Another important point in dealing with this product from classification is to have a continuous feed of ground lime to get good settlement.

A native feeding by hand has been used in the past, but this method at the best of times was not continuous.

There are, no doubt, a number of contrivances for regulating the supply of lime. The automatic lime feeder shown (see accompanying sketch), has proved successful on several mines. The chief features of this feeder are the continuous feed and the ease with which the feeding of lime can be regulated as to the alkalinity of the water.

Often a fine sulphuret, assaying from one to three ounces, is found in the overflow from the return spitzkasten. This is a rich product to be mixed with a 2 dwt. slime. It is possible to catch this fine rich stuff on blankets, burlaps or raw hides, with the hair pointing up stream, and if the scheme for concentrates was adopted this stuff could be returned to the barrel to be treated with the sulphurets.

The first slimes plants were generally provided with large spitzkasten, which were considered essential, especially on plants of 200 stamps, to procure a thorough settlement of the slimes. In the latter plants these large and expensive spitzkasten have disappeared, and the tendency seems to be to put up tanks 50 feet in diameter and allow the slimes to run into these tanks direct. With these large tanks excellent settlement is obtained.

On some mines it is usual to run the washings of the ore from the sorting house into the tailings wheel. This practice is not to be recommended. This slimy material contains a great deal of free gold, and this free gold, which is supposed to be caught in and extracted from sand tanks, has been found iu the slimes plant.

A preferable method of dealing with this material from the sorting table is to run it into pits, feed lime, which would not only cause the stuff to settle rapidly, but help to neutralize it, and then send it to the mill, where the free gold would be caught.

We understand there has of late been extensive experiments made in the treatment of tailing dumps in situ. Now, the gold left in a tailings dump must be either gold in solution, from the moisture left in the residues, or gold left unattacked by the cyanidc. After a number of years' exposure almost all of the soluble gold must be washed out by the rains, so that the only gold to be extracted from a heap is the unattacked gold. We have tried to point out previously that the great percentage of gold in a residue heap occurs in the concentrates and that the amount of gold left in the sands is small.

We have noticed on the tailings heaps at several mines that the cubes of the sulphurcts are gradually split open by the action of the elements, thus exposing particles of gold which were "bound" when the material was first deposited. It strikes us that the gold which might be extracted from a tailings heap would come principally from this class of the product.

It seems unnecessary, therefore, to deal with the whole heap when the gold is principally in the concentrates. Should the necessity of treating tailings heaps occur, it may be well to dump the comparatively rich concentrates residues in a spot already

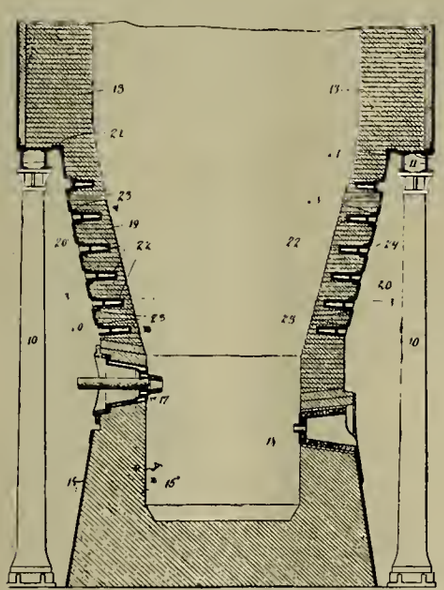
*Abstract Journal Chem., Met. and Min. Soc., S. A.

prepared for their future treatment after oxidation and to keep the poor sands separate.

Personally, we believe it a better policy to get the gold from the concentrates before they go to the tailings heap, provided, of course, it pays to get the extra extraction. Judging from the attention being paid to this part of classification, and the confirmatory evidence from all sides as to the possibility of getting high extractions from concentrates by the cyanide process properly applied, it seems certain to predict that the concentrates residues in the future will be lower than ever they were in the past.

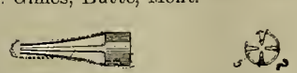
Mining and Metallurgical Patents.

PATENTS ISSUED DECEMBER 8, 1903.



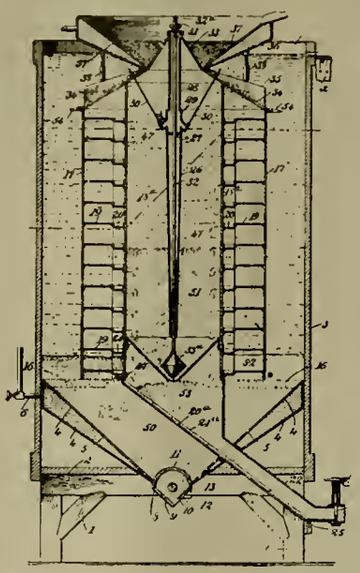
Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

TESTER FOR BLAST CAVITIES.—No. 745,357; C. B. Lanham, Pittsburg, Pa.



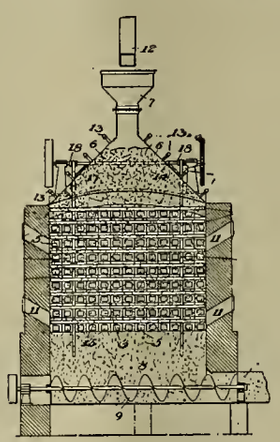
In tester for blast cavities, main protecting casing, measuring chain adapted to operate within same, means for operating chain, and elbow connected to bottom of casing to direct chain.

SUPPORT JACKET OR FRAME FOR COOLING PLATES OR COILS IN BLAST FURNACES.—No. 745,430; A. Farrell, Gladstone, Mich.



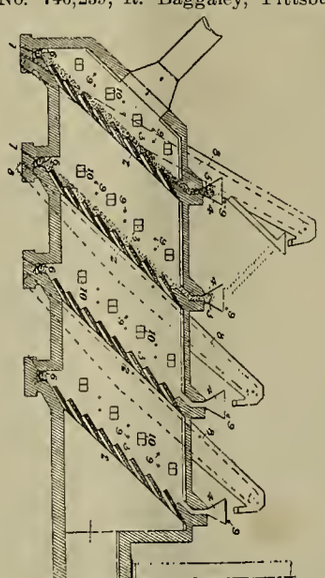
Blast furnace, bosh wall of which is encircled by metal jacket having series of superposed holes formed therein, holes being separated by integral portions of jacket, jacket being provided with projecting supports about holes, and cooling plates or coils extending into body of bosh wall and suspended at outer ends by supports of jacket.

DEVICE FOR PROTECTING BLASTING CAPS.—No. 746,262; D. B. Gillies, Butte, Mont.



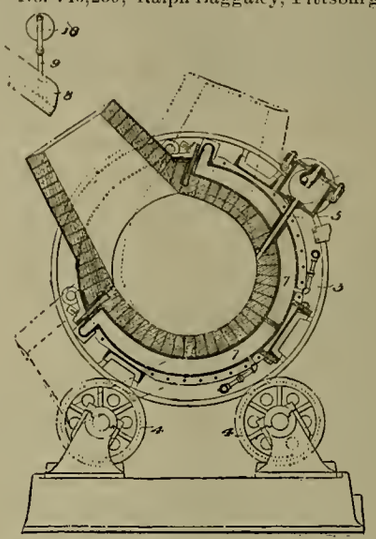
Guide for inserting blasting cap into flexible sheath, guide comprising tapering spring arms adapted to be inserted into sheath and affording between them passage for cap.

ORE CONCENTRATOR.—No. 745,860; E. W. Keeler, New York, N. Y.



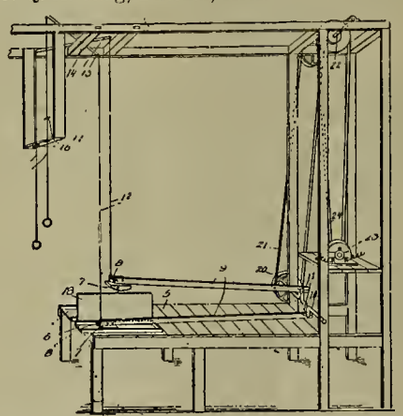
Ore concentrator, comprising vessel for containing concentrates, plurality of chutes provided with side passages leading into vessel, plates coated with mercury and disposed within chutes, conical member, plurality of radially disposed channels mounted upon conical member and connected with chutes, and means for discharging ores and water upon conical member.

APPARATUS FOR REMOVING IMPURITIES FROM FURNACE GASES.—No. 746,261; R. Baggaley, Pittsburg, Pa.



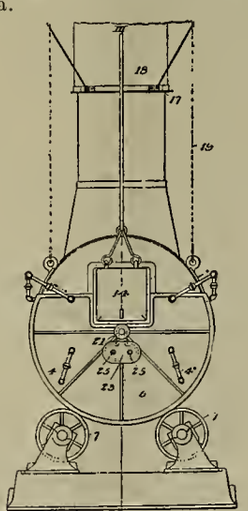
Apparatus for removing impurities from gases, comprising charcoal screen interposed in path of gases, moving mechanism adapted to remove impregnated charcoal from base of screen, means for feeding fresh material to screen to replace portions removed, and cutter mechanism arranged to dislodge deposited impurities from the walls of apparatus.

PROCESS OF RECOVERING VALUES FROM SMELTER GASES.—No. 746,259; R. Baggaley, Pittsburg, Pa.



Method of recovering valuable dust from smelter gases, which consists in precipitating same upon filtering material such as ore, matte or converter slag, containing metallic values fit for reduction or smelting with precipitated dust, whereby values contained in both filtering material and precipitated dust may be recovered together.

METHOD OF RECOVERING VALUES FROM SILICEOUS ORES.—No. 746,260; Ralph Baggaley, Pittsburg, Pa.



Method of recovering values from value-bearing siliceous ores, introducing into copper converter such ore in solid lumps or particles, adding molten matte to converter, bessemerizing same, and fusing ore, whereby values are recovered and gangue of ore is utilized as flux.

ASSAYER'S PULVERIZING APPARATUS.—No. 746,104; J. Q. A. King, Phœnix, Ariz.

Ore pulverizing apparatus, consisting of flat surfaced bucking board, muller resting by gravity upon board, motor, crank shaft driven by motor and located in same or nearly horizontal plane with board, and pitman freely joined to crank and rigid with muller, and serving to impart both reciprocating and rocking motion to muller.

REFINING COPPER.—No. 746,246; Ralph Baggaley, Pittsburg, Pa.

In the process of refining copper, forcing through copper when molten, and after oxidation and removal of its impurities, reducing gas generated independently of heat of copper and prior to its introduction thereinto.

Mining Summary.

SPECIALLY COMPILED AND REPORTED FOR THE MINING AND SCIENTIFIC PRESS.

ALASKA.

The Fjeld M. Co. group on the Tanana has been bonded to B. F. Millard for $1,000,000, says the Valdez News.

The gold sbipments through Dawson from the American Yukon during the open season of navigation in 1902 and 1903, given in ounces, are shown by the comptroller's records at Dawson as follows:

	1903.	1902.
April	94	....
May	200	....
June	3,387	1,384
July	1,741	1,562
August	1,692	4,078
September	6,247	8,832
Totals	13.361	15,856

These gold shipments from the American side passed through the Canadian territory under special permit, which exempts them from the Canadian royalty of 2½%. They are chiefly from Forty-Mile, but include considerable sums from Rampart, Circle, Koyukuk and other scattering places on the lower Yukon. A large proportion of the gold from the American Yukon goes to the States by way of St. Michael.

The gold output of Alaska for 1903 may exceed that of 1902, though the gold yield last year was $8,283,408. The increase in the gold and silver product of Alaska for 1902 amounted to $1,400,254 over tbe product of 1901. The increase in gold alone amounted to $1,351,181, the Nome district having shown an increase of $430,182 over 1901. Last year the Douglas and Unga Islands quartz mines produced $2,577,883 worth of gold, and the rest of Alaska, exclusive of these mines and the mines of Nome, produced $1,259,238. Quartz mining in southeastern Alaska is increasing and new properties will be in operation next year.

ARIZONA.

Cochise County.

Work is progressing on the Copper Queen smelter being built at Douglas. An elevated railway 1400 feet long has been completed. Three mixing pits, each 700 feet in length, are ready for use with an electric trolley line for each. A mile of 3-foot blasts and flue dust pipe is on tbe ground and being hoisted into position, says the Douglas Dispatch. The engines are all in position in the power house, representing 9000 H. P. Three thousand sacks of cement were used in tbe foundation of the power house. Thirteen engines are in position, and the traveling crane is up. The brick chimney is 170 feet high, and the 200-foot stack, which will be built of half-inch boiler iron, has been started. The main building of the Copper Queen smelter is 396 feet long.

Graham County.

P. F. Crowley, workiug the Antietam mine at Metcalf, reports that he is running a crosscut at the 140-foot level, and has cut the vein for 15 feet, showing ore that averages 10% copper. The values are in chalcopyrite and glance.

W. Wallace, superintendent of the San Jose group, near Metcalf, says he has five men employed, and work is progressing. W. B. Thompson is the owner.

A. S. Rosecrans, manager of the Standard C. Co., near Clifton, reports that the aerial tramway is completed and was put in operation this week. During construction of the tramway the output of tbe mine was reduced, as the pack train was used in carrying the timbers for the tramway. The ore will be taken from bins at the mine and conveyed to bins on the railway track.

In Lone Star district, near Clifton, Superintendent J. F. Webber of the Federal M. Co. of New York, reports work progressing on the Federal's twenty-seven claims, and he is shipping ore to El Paso, Tex. It assays 20% copper with gold and silver values. A concentrator is proposed. Above 1000 tons of ore are on the dump, assaying 11% copper. On the Great Eastern claim there is a 48-foot shaft. On the San Juan a shaft is down 130 feet. A cross cut caught tbe ore body, at 100 feet.

Maricopa County.

(Special Correspondence).--Reports from Buckeye say the Gila Gold Lode M. Co. has made a rich strike of ore in a shaft being sunk on one of its claims in the White Tank mountains, north of Buckeye.——Manager Hewins reports development work in progress at the Pike's Peak mine, west of Frog Tanks. A body of high-grade ore has heen cut.——At the Relief mine, near Phœnix, a stamp mill will he built.

Men are at work at the Ryland mine, near Morristown, and more men will he added. The Arizona M. & D. Co. recently bought this silver-lead property.

Phœnix, Dec. 13.

(Special Correspondenco).--J. E. Maddox has put on more men at his mine in the White Tank mountains, west of Phœnix.——The Ben Hur mine, in Cave Creek district, will put on more men. This is a low-grade proposition and a cyanide plant will he built.——W. Dunn is putting on more men. They will sink the shaft 200 feet deeper and then run drift from shaft along the ledge. This mine is in the White Tank mountains, near Buckeye, 35 miles west of Phœnix.

G. Francis bas men at work on his group near Morristown, and is shipping ore to the smelter at Wickenburg.

Development work is in progress at the Angel mine, near Wickenburg. Tbe company has bought several additional claims.——The Arizona Granite Co. will put men to work in the quarry south of Phœnix. Machinery for working the product will be put in.——The Hercules Co. will resume work on their group near Morristown this week.——The Mormon Girl mill at Cave Creek will he put in operation next week.

The La Gloria M. Co. is shipping copper ore to the smelter, and the output of the mine will be douhled when a tunnel on one of the claims is completed. The camp is in the White Tank mountains.——H. J. Bennett of Phœnix is developing a gold and copper property south of the Hercules camp, near Morristown. Ore from one of the claims is said to carry platinum values.——Work will be resumed at the Union mine, north of Phœnix, next week.

Pbœnix, Dec. 13.

A 10-stamp mill is heing built on the C. T. Kenna property (the Sun Cloud mine), 45 miles southwest of Congress, Yavapai county. The mill will he a concentrating plant.

Mohave County.

(Special Correspondence). — The McGuire mine, 3½ miles west of Kingman, on the Santa Fe Railroad, has heen bonded for $25,000, and a 50-ton cyanide plant will be huilt.

The Gold Roads mine at Acme is working 125 men. Posey & Bailey of Los Angeles, Cal., principal owners, are sinking from the 300-foot level to the 400-foot. The property is equipped with a 150-ton cyanide plant, which is treating 125 tons daily.——The Lucky Boy mine is shipping two cars (thirty-four tons) per week of high-grade ore to El Paso, Texas. The ore is packed from the mine to Chloride, 5 miles. —— A strike is reported in the Azalia mine, which is reported giving returns from the smelter of $850 per ton, being 27 ounces gold and 615 ounces silver. The ledge shows tellurides. This mine is 1½ mile south of the Dempsey & O'Dea, in Pilgrim mining district, 10 miles west of Chloride. Three men are at work in the tunnel and four men working the assessments on the group of eleven claims. T. E. Cary, N. E. Pettit and J. W. Brown of Kingman are owners.

It is reported tbe Moffat & Root White Hills M. Co. of Denver, Colo., will start up the mill.——The Minnesota M. Co. is developing its ore bodies and intend starting their mill Jan. 1. There are fifteen men at work running drifts and opening up the ore.——The McKesson mines, 1½ mile north of White Hills, has been taken over by C. W. Raymond of San Francisco, Cal., for Minneapolis, Minn., men, and reduction works of sixty tons capacity are proposed.

Kingman, Dec. 14.

Pinal County.

(Special Correspondence). — Russell & Arthur are working their claims near Superior. High-grade ore has heen found and more men will he put to work.

Superior, Dec. 13.

(Special Correspondence).—G. Schade has been developing his claims near Kelvin and will arrastra the ore obtained. ——The Copper Butte M. Co. will resume work this week. Their elaims are 7 miles from Kelvin. In the spring the Phœnix & Eastern Railroad will be completed to within 2 miles of the group.——Several promising elaims have heen located near Walnut Springs.

L. D. McClure has bought a group of gold claims in the Butte district. The ore carries values in gold and is free-milling. Development work will be increased and a stamp mill built.——Manganese ore has been found near the Silver King mine.

Florence, Dec. 13.

Sinking has heen resumed in the Arizona-Pacific double compartment shaft at Camp Woolley, near Florence, with three eight-hour shifts, and will he continued to a depth of 500 feet.

T. Kavanaugh, superintendent of the Troy Manhattan mine at Troy, says the Alice tunnel on the Troy group is in 1300 feet and is being driven at the rate of 60 feet a week. The distance yet to reach the Alice vein is 560 feet, and the tunnel will cut the lead at depth of 780 feet on the incline of the vein. It will drain the Alice and adjoining claims and furnish an outlet for ores to the company's smelter site on the Gila river.

The double compartment working shaft sunk on tbe Superior & Arizona mine, near Florence, to cut the vein at a depth of 125 feet, has cut a vein for 20 feet. The vein has a dip of 45°. The vein material carries considerable oxide of iron.

Yavapai County.

The Baumann C. Co. will resume work on development of its group near Mayer next week. It has been idle for a year. The shaft on the Swiss Girl will he continued to depth of 500 feet, says Manager J. Baumann.

The smelter of the United Verde is again in operation, after a temporary shutdown due to shortage of coke. Work on additional coke bins for the U. V. Co., at Jerome Junction, is progressing.

The Prescott Courier says the Empire mine and mill at Groom Creek will start up in January.

At Mayer the buildings of the Rigby R. Co. reduction plant are completed. Concrete foundations for the machinery are being put in.

D. N. Jenkins, at Mayer, has started up work on his Cinderella group. Some development work has been done. The ore carries values in silver, gold, copper and lead.

CALIFORNIA.

Amador County.

Operations at the Sand Pile mine near Forest Home are temporarily suspended, pending replacing the gasoline engine that furnishes power to hoist the sand to the tanks, as it broke down last week. D. Fricot, the owner, says the average daily treatment of the auriferous sands is 240 tons, and the yield is 80% to 90% of the assay value. The pile of tailings from the Plymouth mills covers several acres and carries $1 per ton in gold. Treatment costs under 50 cents per ton.

Last week F. & A. Eudey bought the Pleming property, adjoining the Zeila mine on the north, near Jackson. It is intended to combine the Pleming and Eudey ranches, covering a tract of land along the east or Zeila lode, and operate the same for mineral values.

The Sutter Creek Miners' Union on the 16th inst. declared the strike off at the South Eureka mine. The three men who were discharged will not be taken back. One of tbe engineers belonging to the Western Federation was called out shortly after tho strike was declared Nov. 16. He will not be employed again, says Superintendent Moore, as they will have hut two engineers hereafter. Superintendent Moore will take back the men as fast as places are found for them. The mine has heen kept free from water by the two engineers who remained at work.

Butte County.

(Special Correspondenco).—The mill at the Southern Cross is running steadily and it is reported more men will be put to work the first of the year to open up other mines which the Edel M. Co. has bought, near Enterprise.

The Cortez G. M. Co. is driving their tunnel ahead to open up the ore shoot. ——D. R. Widmer, who has bought the Schoff mine on Sucker Run, will begin this week driving a tunnel 2000 feet long. This tunnel will cut three ledges, and if they are found to prospect as well as they do on the surface, a stamp mill will be built.

Enterprise, Dec. 16.

Calaveras County.

The Tom Smith mine, near Sheep Ranch, has resumed operations. The tunnel is being driven ahead. A. Poe is superintendent.

The injunction papers were served on the 16th inst. on the striking miners of the Royal Con. mine at Hodson, and an attempt will be made to open up the mine with men brought in from tbe outside. One hundred and sixty strikers and sympathizers are camped about the mine. They maintain a picket line around the property and have allowed no one to pass the line except the mine officials. The mine has a guard of five watchmen armed with rifles. The engineers have remained on duty and the pumps are running. If the strikers disobey the court order warrants for their arrest for contempt of court will follow.

Del Norte County.

The National M. Co. of Tacoma, Wash., has bought the Sanger group of copper claims. The Sanger group consists of 700 acres of mineral land covering thirty-five copper claims a few miles south of Waldo, Or., and the Oregon-California line. Values in gold are also carried with the copper. I. A. Town, S. J. Pritchard, C. Kreis and G. P. Larsen of Tacoma, Wash., are the principal stockholders. ——The National Co. has put men to work on the group for development during the winter. The company proposes building a 500-ton smelter, the surveying of a townsite and the building of an electric line to connect the mines with the California & Oregon Coast road that is to he built from Grants Pass to Eureka.

At the Cleopatra group of copper claims, on Diamond creek, near the Sanger claims, south of Waldo, Or., twelve men are at work, says Manager Crawford of Grants Pass, Or. The Cleopatra group will be further developed, proceeding hy three tunnels, two of which have been driven in 570 feet, and are drifting on the ledge. They propose to put in a smelter.

El Dorado County.

Operations have heen resumed on the Ida Mitchell mine at Placerville, with D. H. Jackson as superintendent. Development work will be increased before putting up a mill.

Inyo County.

The Buckeye M. & S. Co. of Mansfield, O., operating mines in the Fish Springs hills, near Bishop, reports work progressing, opening up the ore bodies. A. A. Casler is superintendent.

Kern County.

Development work is progressing on the Queen Esther mine at Mojave and in addition to other improvements there is a cyanide plant on the ground, with a capacity for handling 100 tons of ore a day. There are 2000 feet of underground works. The ore body averages 10 feet in width, with values said to he $6 a ton in gold and silver.

At McKittrick, H. B. Guthrie & Co., operating south of the McKittrick extension, struck oil last week at depth of 1200 feet. The land is outside of the established proven helt at McKittrick.

J. M. Wright of Bakersfield, president of the Peerless and Fulton Oil Cos., will resumo drilling operations on his holdings adjoining the properties of the Bay City, the California Con. Crude and the Chanslor-Canfield Cos.

Mono County.

The Standard mine is closed down temporarily. The dam at Green Creek is leaking and it is being repaired.

The Monte Cristo M. Co., composed of Carson City, Nev., men, has bonded a group of claims 4 miles south of Sweetwater. A test run of ten tons of ore from the property has been made. An 8-stamp mill will be put up.

There are forty men employed by the Crystal Lake G. M. Co. at Lundy. Supplies for tbe winter are in.

Nevada County.

Work is progressing on the 20-stamp mill at the Canfield mine, at Blue Tent. Superintendent Grabam says it will be ready to start in January.

Superintendent C. H. Mallen has had the second electric pump set up on the 1000-foot level of the Brunswick mine at Grass Valley, and is raising water from that level. It will continue until the 1250-foot level is reached, which is the bottom of the mine.

Superintendent J. L. Bryson has forty-five men at work at the El Oro (Yuba) mine at Maybert. Work is progressing on the aerial tramway for conveying ore from the Mayflower mine, 2500 feet southwest from the El Oro mine, at an elevation of 1100 feet. The main carrying steel cable is 1¼ inches in diameter, and the rope on which the buckets return is ⅝ of an inch. The hauling rope is § of an inch. There will be twelve buckets, each carrying 400 pounds, which will be filled and dumped automatically. These stretches of rope are supported between the terminals hy five towers 30 feet in height, and it is thought the line will be completed by next week. The Mayflower mine and El Oro are both being reopened. Two air compressors are set up at the mill and a 3-inch pipe line conveys air to the Mayflower, a distance of 2500 feet. All machinery is run by water power, which is obtained from the Yuha river by means of flumes, one giving head of 40 feet for milling purposes, while the other has a head of 100 feet and runs the compressor. The 15-stamp mill is being overhauled. Ten stamps will be added in the spring.

At the Orleans mine, near Grass Valley, a ledge 16 inches wide has been opened, says Superintendent Brockington, at the 400-foot level on the north side. The rock is well mineralized and free milling. The mill is in full operation.

It is stated work will be resumed at the Merrimac mine, near Town Talk, near Nevada City, which has been idle for several years.

Superintendent White of the New York-Grass Valley M. Co., operating near Grass Valley, reports cleaning up last week 700 ounces of amalgam from a sixteen-days' run of the roller mill. The shaft is down 650 feet, and being sunk on the vein. Drifts east and west are being run at the 500-foot and the 600-foot level.

At Meadow Lake, in eastern Nevada

county, at the Crystal Lake mine, men will be kept at work during the winter. The 10-stamp mill will not be used until spring. The mine workings are down 140 feet. C. Raymond is superintendent. At present there are 3 feet of snow on the road leading to Meadow Lake.

Placer County.

E. K. Hawkins, superintendent of the Holmes L. Co., says the lime works on Bear river, 3 miles from Colfax, are nearing completion. The company is building two continuous burning kilns, with a capacity of from 100 to 125 barrels of lime daily. The company has surveyed for an aerial tramway to convey the lime from the kilns to the top of the hill above the works—a distance of 2800 feet. The elevation from the kilns to the end of the tramway is 605 feet. The tramway will intersect the wagon road near the Big Oak mine, and from there the lime will be hauled by teams to Colfax. Electricity will be used as motive power on the tramway. A storage house for the lime will be built at the works with a capacity of 100 tons.

Plumas County.

H. L. Archer of Minneapolis, Minn., manager of the Colonial M. Co.'s interes s in California, says work is progressiog on the company's mines on Mill creek, south of Quincy. A hoistiog plant has been put up on the gravel deposit, which the company will work through a shaft 50 feet deep. A tuonol has b en driven 600 feet into the Homestake quartz mine, being run on the ledge. At present the backs are 400 feet high. The company is also running a tunnel on th · Mountain Chief. Archer says he expects to have a 10-stamp mill ready for operation in the spring. Men are cutting a ditch to convey the water for power purposes.

The Premium mine, near the Kingdon ranch, at Indian Valley, is being developed by A. E. Wood & Co. of San Francisco. A. E. Westover is superintendent. The Premium is on the eastern gold belt.

Riverside County.

Preparations are said to he under way for the reopeniog of the tin mines (formorly called the Temescal mines) on the San Jacinto estate, 7 miles southeast of Corona. In 1891, considerable money was expended in putting up buildings, metallurgical works and other surface improvements, but comparatively little development work done underground. The Americao Tin M. Co. are operators.

Sierra Cuunty.

(Special Correspoodence).—Manager L. H. Carver, of the Mountain mine, near Sierra City, reports the men have cleared out the lower tunnel (No. 3), exposing a shoot of ore 500 feet in length. The vein fills the tunnel, and is 10 feet wide in places. Assays are reported showiog an average of $4 per ton. The mill is expected to be in operation next month.

Sierra City, Dec. 16.

San Bernardino County.

The Giant Ledge M. Co. is working sixteen men on its group of mines in New York mountain, near Manvel.——The Old Bullion mine in Copper Camp, near Needles, has men at work under P. Monaghan of Oro Grande. The mine was a former silver producer.

San Mateo County.

At Half Moon Bay the Fountain Oil Co. reports a strike of oil last week in their well. The oil is flowing over the casing.——The Duchess Oil Co. will begin drilling work next month.

Santa Barbara County.

Santa· Barbara reports say that extremely high tides last week wrought considerable damage at Summerland, on the coast, 6 miles east of Santa Barbara, where several hundred oil wells have been drilled well out on the beach. A number of wharvos owned by oil companies were damaged by heavy seas, and sections of some were carried away.

Shasta County.

F. H. Dakin of San Francisco is sole owner of the Newcomb Uncle Sam mine, having bought the one-half interest. The mine will be reopened. The ore body is blocked out and the mine is kept in repair.

Siskiyou County.

The Scott & Co. quartz mine at Indian creek, near Fort Jones, has its mill in operation with power from the Siskiyou Electric Power Co.——A. C. Brokaw, on Indian creek, is opening up the Golden Eagle mine, on which he has a steam plant for hoisting and operating the machine drills. As soon as he gets the shafts and crosscuts completed, he intends putting up a mill and a compressor plant.

The hydraulic mines in Quartz valley, near Fort Jones, are being worked with plenty of water to keep the giants and elevators supplied, says the Yreka Journal.

The San Francisco Co., which bought the Mott river claim on the Klamath, above Oak Bar, will opon the same, retaiuing M. Mott as superintendent. It will be worked by sinking open cuts in river to bedrock of channel, using dorricks oporated by water wheels in raising gravel.

Trinity County.

(Special Correspondonce).—Tho Brown Bear mine will shut down for the winter; ten leasers will keep on, however. This is tho first timo in twenty-five years that so little has been done at the Brown Bear in the winter time. Active operations will be resumed April 1.

The Lappio mine in the samo vicinity will also close for the wiuter.

Deadwood, Dec. 16.

At Trinity Center L. M. Mossmer of San Francisco has bought the Stoddard undivided half interests in the Viola Bello, Summit, Highland Chief, Annie Lucy and Transit quartz mines on Squirrel gulch, in Trinity Center mining district: also all of same interests in the waters of Cedar creek and Squirrel gulch, says the Searchlight.

Tho Trinity County Hydraulic G. M. and M. Co. has been iocorporated at Eureka, Humboldt county, to operate mines at New River. W. H. Ball of San Francisco, G. D. Johnson, W. M. Crown, F. J. Reid and W. J. McNamara of Eureka,, are incorporators.

The Dandy Con. quartz mine at Minorsville is showing up. Van Ness Bros. are principal owners. No. 2 tunnel, which is beiog run, shows a vein 3 feet in width, carrying $10 a ton in freo gold.

Tuulumne Couoty.

The Tuolumne mine, near Columbia, on Wet gulch, is being worked again, operations being resumed last week, with M. Pago as superintendent. Developmeot work coosists of two tunnels—one 1700 feet long and the other 600 feet. A 5-stamp mill is on the mine.

The Prudbomme M. Co. has bought the Clever Valley quartz mine (being the north extension of the Prudhomme mine), near Arastraville, and the Prudhomme south extension. The Prudhomme M. Co. has been reorganized under name of the Prudhomme G. M. & M. Co.

R. B. Lane has bought the F. E. Lane half interest in the Fairoaks quartz mine, a one-fourth interest in the Riverside, on the north fork of the Tuolumne river, near Carters, and a one-fourth interest in the Vista de Oro mine.——J. A. McMahon has bought the Fairoaks quartz mine, near Soulsbyville; and R. B. Lane has bought the Palo Alto quartz mine, on north fork of Tuolumne river, near Carters, and adjoining the Riverside mine, owned by R. B. Lane.

The Confidence mine at Confidence, which it was the intention of the company to shut down indefinitely, will he in full operation in the spring, says the Sonora Independent. The mine will he kept clear of water during the winter.

The mill at the Mapes mine, near Yankee Hill, near Columhia, started up last week.

A. Carter has put men to work on the Blue Eagle claim, wbich he has under bond at Jawbone, near Groveland. A tunnel to cut the vein will be run.

The Big Casino Co.'s tramway is completed. The mine and mill are running steadily.

The John Royal and Star mines, near Columbia, are again in operation, and work will be resumed at the Mountain Lily. Progress is being made sinking the new shaft at Altadena.——The shaft at the Golden Eagle mine is being unwatered, preparatory to resuming drifting and stoping.——Men are at work putting up the additional five stamps at the Vine Springs mine.

The attempt by the management to reopen the Black Oak mine, near Soulshyville, has been abandoned because of tbe insistent demands of the union. The owners will not accede to the demands of the uuion miners to operate tbe property with white men exclusively. Several Chinese were employed as ore sorters and canvas sweepers up to Nov. 9 and were paid $1.75 a day, and the demand was to supplant them with white men at $2.50 a day. The owners say that white men could not he obtained to perform the disagreeahle work at any price.

COLORADO.

(Special Correspondence).—During the past week a decided improvement in business is reported hy the mining machinery and supply houses of Denver. The strike situation is adjusting itself over the State. The coal famine which threatened the entire State is ahout over. In the northern fields the miners are agaiu at work, while in the southern fields the companies are operating with non-union men. An outhreak occurred near Trinidad last week in which two Italian strikers were killed. The sheriff of the county seems able to handle the rioters without the aid of the militia. Reports from Telluride show the mines are getting under headway again. No further disturbances are reported from Cripple Creek district, it being under martial law.

Denver, Dec. 4.

Bauldor County.

Near Ward the Modoc mine, which has been closed down for four years, has been bonded and leased to Q. R. Heriod and H. Cowie, of Denver. Tbe mine will be reopened. The Modoc is equipped with a 30-stamp mill and hoisting plant. The mine is ¾ mile north of Ward and is worked through a shaft 350 feet deep. Thore aro four principal drifts which have heon run from 350 to 800 feet. Tho ore is sulphide and free milling and the veins are 30 feet in width.

At Magnolia tho Nelly Bly mill has been overhaulod and will resume operations this week. The mill will use the cyanide process.

At Salina at the Belle mine, Superintendeut E. T. Wehber says at the 400-foot point on the lower tunnel a station has heen cut out, a 100 H. P. boiler, 8x10 hoist, pump aod compressor plant have been set up there. Ore is heing takeu out which carries calaverite and free gold.

Chaffee County.

At Winfield, in the northwestern part of tho county, 20 miles from a railroad, the Bankers' M. & M. Co., of which E. A. Stahler of Allontown, Pa., is manager, is shipping ore which is giving returns of $5 gold, 310 ouocos silver per ton, 9½% lead and 2% copper. Stahler is also intercsted in the Belmont group in the same section.

At the Latchaw mine, on Mount Princeton, near Buena Vista, the machinery is in place and operatioos hegun. The tunnel will he driven another 1500 feet to catch the Dandy Butler vein. The tunnel face is in 1500 feet. The machinery is run by electricity. A trolley lino has been run into the tunnel so that the cars will be handled in trains.

The Copper King mine, owned principally by W. E. Mason of Chicago, Ill., and E. E. Briggs of Salida, and located in Turret district, is showing high-grade copper ore. The ore shows free copper and the vein is 12 feet wide. It dips into the mountain at a sharp angle and was cut by a vertical shaft at depth of 80 feet. Men have eut the station preparatory to driving the drifts at the 80-foot level. Superinteodent E. E. Briggs says preparations are being made to huild a leaebing plant. A 50-ton concentrating mill is under construction on the Vivandiere mine, near the Copper King.

Clear Creek Couoty.

The Hansbrough tunnel, which will develop Democrat mountain near Georgetown, will open up the Clift lode, says Manager B. F. Kelley.

It is reported the Lebanon mines near Georgetown, after an idleness of twenty years, will resume operations next month.

The Indiana G. & S. M. & M. Co., operating on McClellan mountain near Georgetown, is making arrangements to increase work during the winter. Manager Stephens will drive the tunoel an additional 100 feet on the Indiana lode. Later, another tunnel will he driven farther down the mountain, to eut the vein at greater depth.

The Southern M., M. & D. Co. will start operations on its group on the northern slope of McClellan mountain, near Georgetown.

Coster County.

The Bassick mine at Silver Cliff is in full operation. It is reported the Bassick mill will be improved and its capacity increased hy addition of machinery.

Fremont County.

The Union mill of the United States R. & R. Co. at Florence, whieb has been idle since the strike in Cripple Creek district was declared, resumed operations this week. This mill will operate at its full capacity of 500 tons of ore per day.

Gilpin County.

The Mountz & Palmer mill, near Central City, is running steadily. The ore is coming mostly from their Mackey mine, but some custom ores are also being handled. Tbe mill is doing both amalgamation and concentration, says Manager L. J. Mountz.

The Nevada Con. G. M. & M. Co., near Central City, is preparing to put in a 100-ton addition to its concentrating plant. The addition will necessitate another building 90x140 feet, whioh will be equipped with Blake crusher, four jigs, two sets of rolls, two Huntington mills, five concentrating tables, together with screens, pumps, elevators, etc. As the ore of the King and otber mines operated hy this company carry as high as 20% in zinc values, there will he an electric zinc separator. The equipment will consist of two engines, one of 15 H. P· and one of 30 H. P., and a 115 H. P. boiler. The company will also put in an electric plant for lighting its mines and milling plant.

The Electric Spark G. M. Co., operating the Shamrock mine, near Russell Gulch, under lease and bond, is shipping smelting ores and concentrates. Superintendent G. Rogers says the company will sink the shaft another lift, besides doing other development work. Omaha, Neb., parties are interested.

Sinking operations bave heen resumed at the Cook mine, near Central City, with three eight-hour shifts, tho shaft being down 1240 feet. It is intended to sink at least 200 feet deeper. Thore are thirty uien at work on leases in different parts of the workings, and ores of milling grade are being sbipped, particularly from the Bohtail tunnel. O. B. Thompson is manager and W. H. Davis superintendont.

Gunnison County.

The New Era M. Co., B. T. Brooks of Denver manager, has bought the Occidental and Oversight lodes at Camp Ideal and will start development work this week.

Tho Raymond Con. M. Co. has bought the Gold Bricks mine on Ohio crcek, near Pitkin. Tbe company owns the Raymond, Cyrus, Humboldt, Alexander, Dawn of Day, Midnight aod Monte Carlo. Back of the Gold Bricks the Raymond Co. this fall put in a plant of machinery on the Raymond and unwatered the workings, and at the bottom of tho shaft has opened a shoot of ore 250 feet in length, with a pay streak on tho foot wall 22 inches wide that gives average of 3 ounces gold, 22 ounces silver and 14% lead, while there are 3 feet of concentrating ore that runs $15 per ton. After the value of the property was demonstrated tbe pumps were pulled and negotiations opened for the Gold Bricks, which is said to hold the key to the openiug of the drainage tunnel on Ohio crcek. The tunnel has been startcd and will be 2100 feet long, cutting four known veins at deptbs ranging from 800 to 1200 feet. Buildings are going up at the opening on Ohio creek and foundations are being laid for plant of machinery, including a duplex compressor, electric light, etc.

Hinsdale County.

The Lellie M. Co., operating near Lake City, will put ou more men.

Lake County.

Wells & Doran, lessees on the Silent Friend mine, on Littlo Ellen hill, Leadville, are shipping oxidized ore from the 350-foot level.

The California Gulch M. Co. mine, near Leadville, bas resumed operations under lease to R. O'Neill. There is a plant of machinery on the surface, the shaft boing equipped with a cage.

Mineral County.

The Big Kanawba L. Co. last week granted a sub-lease on the Uuited mines, near Creede, to C. W. Roe, H. H. Tomkins and C. A. Weber. The lease includes all that part of the mine south of the main working shaft, and above the seventh level, and the ore will be taken out through the New Discovery sbaft. A heavier hoisting plant is beiug put in place. This block of ground is said to contain bodies of concentrating ore. Roe owos a mill on the property, and has finished milling 10,000 tons of ore that was hoisted to the surface before the main shaft was connected with tbe Nelson tunnel. The leasers expect to be ready to start the mill Jan. 1.

Park County.

Development on the Dolly Varden mine on Mount Bross, near Alma, a former producer of silver, is reported to have opened up last week a large body of ore, showing average of 600 ounces of silver per ton. Work has been resumed on the Moose mine, also on Mount Bross, and development is showing good indications. A. Hall is part owner of the Dolly Varden.

Summit County.

The Quardary Mountaiu M. and M. Co. expects to have its concentrating mill near Brockenridge running by Jan. 1st. The 7-foot thick blanket vein of the Monte Cristo vein, the principal one of the group that is at present being developed, is reported improving. The ores are lead-silver.

H. S. Whitehead, superintendent of the Providence-Colorado M. and M. Co., near Breckenridge, which has secured the use of the Jessie's 40-stamp rapid-drop mill for test runs on the body of concentrating ore cut by the 190-foot shaft, has started milling. It is expected the mill, with coarse screens in the batteries, and with the ten tables adjusted for heavy concentrating ore, will make a grade of conceotrates which will run $100 per ton in gold, silver and lead. The mine is on the eastern slope of Gibson hill.

Teller County.

F. Strong has a three years' lease on the Victor mine on Bull hill, Cripple Creek, and work will be started tbis week. The shaft is down to a depth of 1400 feet.

Lessees R. P. Russell and J. Sharp, who have a lease on the Colorado Boss No. 3

claim, at Cripple Creek, have opened up the body of ore and have begun shipments. Sharp is also lessee of the Morning Star claim. They are operating on the 330-foot level, some distance from the shaft in the south end of the Boss, and are working two machine drills in the ore, but will increase the number. The vein is running 12 inches in width, averaging $30 per ton.

The Matoa G. M. Co., owning holdings on Gold hill, Cripple Creek, has work under way on the Halfmoon claim. There are fourteen men at work and sinking the shaft is in progress, being down 850 feet. It is intended to go to the 1000-foot level unless interrupted by water; after which lateral work will be started. Stations will be cut at 900 and 1000 feet.

The Vindicator mine at Victor is again in full operation and producing fifty tons of ore per day with two shifts employed, says Superintendent Trevarro. Ore is being broken down on the four lower levels not bothered with water (including the tenth level). No attempt is being made to unwater below the tenth level as yet. The El Paso drainage tunnel is expected to drain the Vindicator when the water course between the El Paso and Elkton mines is cut. There are 200 feet of water in the Vindicator and the Lillie adjoining has 500 feet, but the latter shaft is 300 feet deeper than the Vindicator.

The washing machine on the American Eagle dump, Cripple Creek, is in full operation. Lately only screenings have been handled, and from returns received the ore runs three ounces gold per ton. There is a large amount of rock in this dump.

The Findley mine, on Bull hill, is closed down and will continue so until January 15th, due to putting in a new plant of machinery. Men are at work building a foundation for the hoist. This mine was practically closed down during the greater portion of last month, as its total production was 250 tons of ore, while the shipments generally amount to 750 to 1000 tons per month. The ore is said to average $25 per ton.

The Cripple Creek Times says the superintendents and managers of the mines state that they are full-handed with men, and have no room for any more. Every superintendent in the camp is receiving numerous applications for work daily. Quite a number of miners are being enrolled to be sent to Telluride. There is a surplus of all kinds of workmen in the camp, with the exception of machine drill men, though all the superintendents state they have plenty of machine operators. It is estimated that there are between 2800 and 2900 men at work on the properties which are under the ban of the Western Federation of Miners. This number, with the men employed on the Portland and Midget mines, brings the total up to nearly the number of men prior to the strike.

The military authorities have refused service of release papers in the habeas corpus case of Victor Poole, the union miner being held in the "bull pen," maintaining the right of the Governor to declare martial law. Application has been made to the State Supreme Court for a writ of habeas corpus.

During the month of November eleven shipments were made by Lessee Granfield from the C. K. & N. Co. mine on Beacon hill, Cripple Creek, a total of 431 tons. The average was $45 in gold per ton. The shaft has been sunk to level of the Cripple Creek drainage tunnel and a crosscut is advancing from the shaft at that point to meet a lateral underway from the El Paso. The completion of this crosscut will permit of further sinking. In addition, a drift has been started in another direction from the bottom of the shaft to open the ore shoot.

Operations will be resumed Jan. 1 on the Hull City placer mine at Independence. A. E. Carlton has a lease and will start with forty men. This producer has been idle for several months. There are several ore shoots opened up.

GEORGIA.

Lumpkin County.

Dahlonega reports say another vein of gold ore, with a thickness of 18 inches, has been cut on the Jumbo mine. On going down on this vein it has widened to 3 feet. The vein runs through the property and can be cheaply worked, being a downgrade from the open cuts to the millsite.

IDAHO.

Blaine County.

The Quincy Junior M. Co. has been incorporated at Salt Lake City, Utah, by H. J. Hoyt and F. A. Nimes of Muskegon, Mich., F. M. Cook, C. Hernsheim, H. P. Henderson, W. V. Rice, J. Farrell, W. W. Armstrong and W. A. Wilson, with general offices in Salt Lake. They will operate near Haley. W. V. Rice, of Salt Lake City, is president.

Boise County.

L. Bunch, of Garden Valley, owner of the Big Bend placers, on the Payette river, 12 miles up stream from Garden Valley, says a tunnel will be driven to divert the Payette river. At the Big Bend placers, a ridge juts out into the river, causing the stream in passing around it to form a horseshoe. It is proposed to pierce this mountain by a tunnel through which will be diverted the waters of the Payette river. The tunnel will be 14x16 feet in the clear and 800 feet long. The flow of water through the bore will expose 2½ miles of river bed, which will be worked. The Hidden Treasure Placer M. Co., Ltd., has been incorporated to carry out the work.

The Liberty Placer M Co. has been organized at Idaho City by H. L. Fisher, F. M. Gay, A. & S. Small and F. Long. The company owns an area of placer ground 2 miles below Idaho City, on the south side of More creek. A dam, 159 feet long and 10 feet high, will be built in the canyon below Warm Springs and from the dam a flume 900 feet long, 6 feet wide and 5 feet deep, will be constructed, which will give a pressure of 14 feet. A turbine wheel will be put in which will develop 200 H. P. to run a pump to lift 700 miner's inches of water and give a pressure, for mining purposes, of 100 feet. Work will begin on the dam January 1st. The ground near the creek has been tested and is reported to average 30 cents per cubic yard. With 700 inches of water and a pressure of 100 feet, the company expects to work 1000 yards per day.

Idaho County.

(Special Correspondence).—The Thunder Mountain M. Co., owning the Pickwick group of seven claims at the foot of Rainbow mountain, on Sugar creek, adjoining the Rio Grande group, has opened two veins of ore the past season. One of these is 60 feet wide and the other is 63 feet wide, each assaying an average of $4 gold. One tunnel has been run on the south vein for 95 feet, which will be continued 300 feet farther this winter. The Fairview Extension G. M. Co. owns one quartz claim adjoining the Fairview and thirty acres of placer ground on Rainbow creek. A tunnel has been run 280 feet, cutting the Fairview vein. The ore is free milling and carries values of $4.50 per ton in gold. Both these companies are under management of C. J. Perkins of Cripple Creek, Colo.

The Gold Ridge M. & M. Co. is operating a group of six full claims and a fraction (the Fairview), on the eastern slope of Rainbow mountain, adjoining Roosevelt. Developments are 300 feet of tunnel on Fairview No. 3 and 450 feet of tunnel and 50 feet of winze on Fairview No. 2, with open cuts and shallow shafts. A vein 40 feet wide is showing, of which 28 feet is said to give an average of $10 per ton. A working tunnel of 1000 feet is being driven to cut the ore body 500 feet below the surface, and is in 550 feet, being driven at rate of 2 feet a day with two shifts. A. Urdehl is superintendent.—The Divide Creek Tunnel Co., R. A. Hendricks and F. H. Barnett, of Boise City, principal owners, has a group of seven claims on Porphyry ridge, between Coney and Divide creeks, 2 miles southeast from Roosevelt. A tunnel on the Georgia Holt claim has been driven 75 feet in white and blue quartz-porphyry showing sulphides. J. Pierson is superintendent. The Thunder Mountain Gold Reefs M. & D. Co., of Kansas City, Mo., Superintendent W. E. Jewell, owns several groups of claims in the porphyry belt of Thunder mountain, also the Mayflower mine at Warren. The Monumental-Buffalo group of four claims on the west side of Monumental creek, 4 miles south of Roosevelt, have received the most development. A tunnel was driven 220 feet in Four-mile creek ridge and cut six veins from 2 to 11 feet wide, carrying gold values. A lower tunnel was started at right angles to the upper one, to strike the contact between the porphyry and the diorite, and is 350 feet above the creek. It is in 155 feet. At this tunnel the company has quarters for men, supplies, tools, etc. On the Chelan group of two claims on Porphyry ridge, bought by this company, a tunnel has been run. The other claims owned by the company have been sufficiently developed to show ore. This company, like others, has been unsuccessful in securing transportation for its supplies and tools for the winter work. The limited number of pack trains were unable to bring in but a small part of the freight offered, even at ten cents per pound (which was the prevailing price during the latter part of the season).

The Brant M. & M. Co. of Kansas City, Mo., G. Brant president and superintendent, is operating the Cambridge group of six claims at the head of the southwest fork of Monumental creek, 7 miles south of Roosevelt. This company also owns a group on Little Indian creek, from which a shipment of ore sent to Kansas City, Mo., and treated by cyanide, gave returns of $28 per ton in gold.

The Lucky Boy contact is a group of five claims, owned and operated by E. Schwerd on Blue Cap, an eastern spur of Rainbow mountain. Surface cuts have exposed the lead for distance of 2800 feet, and 38 feet wide. A crosscut tunnel, in 40 feet, started to tap the lead 140 feet below surface at 200 feet in. The open cuts show values of $8 per ton for 11 feet of the vein.

Roosevelt, Dec. 11.

Ten additional stamps for the Jumbo M. Co. at Buffalo Hump are being taken in via Stites, says Manager F. Brown. He expects to have them dropping on ore next month. The Jumbo company has fourteen stamps operating, although the new building is fitted for thirty stamps. When the full thirty stamps are up the company will take out the light battery of four stamps in the old mill and set them up on the Del Rio.

Shoshone County.

The Idaho Con. M. Co. of Washington has filed a suit in the district court at Wallace against the Golden Chest M. Co., claiming damages of $20,000 for ores alleged to have been unlawfully extracted. The two companies own adjoining claims near Murray. The complaint states that the tunnel of the Golden Chest Co. has entered the grounds of the plaintiff, and that in extending the tunnel it has been driven on a vein of ore within the ground of the Idaho Con. Co.

Manager Spalding of the Monarch M. Co., near Murray, says they have struck a flow of water at 2900 feet in the tunnel. Measurements showed that the machine drill hole which tapped the water was discharging 9000 gallons of water an hour.

Washington County.

A. G. Stephens, of the Carter White Lead Co., says he has bonds on forty claims in Heath district near Weiser, and has put men at work on several of the claims. On account of snow, he will wait till spring to take in machinery. In one of the claims Stevens says he has nickel-bearing ore. He also has gold and copper ore. Negotiations are under way for a smelter at Weiser.

MICHIGAN.

Houghton County.

Construction work at the Wolverine mine at Kearsarge is nearly ended, says the News. The third boiler at No. 4 shaft being set up is necessitated by the increased depth.

The Wyandot mine drift on the lode, near Winona, which has been opened by crosscut from the exploratory shaft, is in 70 feet, showing the lode widening. It shows width of 3 feet, carrying satisfactory copper values.

The condition of the lode in the South Kearsarge openings of the Osceola mine at Opechee, south of Calumet, is said to be satisfactory. There are forty drills in operation against twenty-five six months ago.

Keweenaw County.

The November mill product of the Phœnix mine, at Phœnix, amounted to 95,700 pounds of mineral; mass copper weighed 22,240 pounds; total, 118,030 pounds, on an average treatment of 142 tons of rock per day, or 1.72%. Arrangements are being made to run the mill continuously on both shifts, thus doubling the output and giving a product of 100 tons of copper monthly on 300 tons of rock treated daily.

At the Ahmeek mine, near Allouez, a temporary rock house is being made for No. 1 shaft, and rock shipments will be started next month to one head at the Tamarack mill as a test of the lode.

Ontonagon County.

The management of the Victoria M. Co., at Victoria, is arranging to put in an air compressor, to be operated by the water power near the mine.

No. 3 shaft at the Adventure mine, near Mass City, has reached the eighth level. The mine is operating twenty drills, fourteen on stoping and the remainder on drifting. Approximately, 360 tons of selected rock are being shipped to the mill daily, says the News. Operations are being confined principally to the Knowlton lode, and this is reported showing well on the bottom drift at the seventh level.

MONTANA.

Beaverhead County.

The holdings of the Tombstone M. Co. of Butte, in Vipond district, Beaverhead county, is under lease to N. F. Way, V. Jennings and W. Martin, who are working it. It consists of mining claims and a 10-stamp mill. The lessees have been working on the vein at the 100-foot level, but are unwatering the other 100 feet. The ore averages $5 per ton.

Deer Lodge County.

Gold-bearing quartz ore is reported by J. R. Boarman of Anaconda opened up in the Gold Coin mine, west of Silver Lake. Development work will be increased.

The West Stewart mine, near Anaconda, owned by W. A. Clark, which has been shut down for repairs, is again in operation. The number of men at work will be increased Jan. 1st, at which time a new hoisting engine will be put in operation. The shaft will be sunk an additional 200 feet. Self-dumping skips will be used.

Fergus County.

The mill of the Chicago-Montana G. M. Co., in Whisky Gulch section of the Judith range, near Lewistown, is again in operation, after a shutdown of a year. The ore supply for the mill will be taken from the Whisky Gulch and Big Six groups, owned by the Chicago-Montana Co. The tramway to the Big Six group has been completed, says C. T. Durell, manager. The Whisky Gulch mill has a daily capacity of twenty tons, with cyanide equipment. The company has seventy men on the payroll.

Jefferson County.

The Pittsburg C. M. Co., which bought the Golden Currie group of iron claims, near Elkhorn, is preparing to work them this winter. An air compressor has been set up and men will be put to work. The Northern Pacific is running a spur from their Elkhorn branch to the mine and will haul the ore to the smelter of the company at Butte. The vein is 24 feet wide and the ore an iron sulphide, which will be used by the company for fluxing.

Madison County.

The workings of the Watseka mines, near Rochester, have been unwatered and the mill started up. The properties are controlled by McCune & Hoge of Salt Lake City, Utah.

The stamps in the Grant mill at Virginia City are dropping. The mill will be run on sulphide ores altogether until the cyanide plant is in running order. L. D. McCall is manager.

Missoula County.

Manager Daxon of Wallace, Idaho, of the Tarbox lead-silver mine, near Saltese, says the shaft is at the 400-foot level and he has crosscut to the ledge. They are drifting on the vein, which runs high in lead. Gray copper has been found on the 400-foot level. The company will increase the capacity of the mill to be built in the spring to 150 tons. The cost of flume for water power and the mill will aggregate $20,000.

Ravalli County.

The Three Mile placer ground, 4 miles below Stevensville, has been sold to Eastern men. The placer ground transferred covers 300 acres and extends along Three Mile creek a distance of 3½ miles. The price is stated at $60,000, and they have begun work on improvements to get water on the ground for hydraulicking.

Silver Bow County.

The Minnie Healy copper mine case is again before the State Supreme Court in another phase, this time on an application for an injunction to prevent F. A. Heinze working the property, pending a final adjudication as to ownership of the mine. Affidavits prepared by the Amalgamated C. Co. interests charge Heinze with already having extracted $400,000 of ore and they allege that if he is not restrained from further operations he will in a great measure exhaust the ore bodies of the Minnie Healy.

NEVADA.

Esmeralda County.

The Belmont mine at Tonopah reports shipping ore which runs $200 a ton. Last week a 4-foot ledge was cut by the north crosscut from the east drift on the 814-foot level, 400 feet from the Desert Queen shaft. It is said the face of the drift averaged $80. It is intended to make air connection on the 814-foot level with the North Star shaft. The distance from the north line of the Belmont ground to the North Star shaft is 160 feet, and the connection will give ventilation in the lower workings of the Belmont.

White Pine County.

The Wide West M. Co., near Cherry Creek, is stoping ore in the main tunnel and drifting in the upper. The lower tunnel to tap the ledge at depth has been started.

The Riepe and Weber mining interests in Sawmill canyon, near Ely, have been bonded to Clements, Whipple and Tucker, for $1,000, and the other claims in the district have also been bonded for $48,000.

NEW MEXICO.

Grant County.

The mill of the National G. & S. Co., at Stein's Pass, is completed, but it can not be started until a supply of water has been developed. The company is sinking its main shaft.

Colfax County.

The mines of the Raton Coal & Coke Co., at Van Houton, are in full operation.

The miners who had struck upon the call issued by the United Coal Miners' officials have all been replaced, and there are 200 men at work getting out 1000 tons of coal per day.

Santa Fe County.

S. H. Farley, manager of the Interstate M. Co., is developing the company's group near Golden, in southern Santa Fe county. A strike of graphite has been made by him.——J. M. Lucas is taking ore from his mine on the Ortiz grant and will treat it in his mill in Tuerto gulch.

The Santa Fe G. & C. Co. has let a contract to run a tunnel 150 feet in the old copper workings at San Pedro.——W. M. Woody has men at work on the San Lazarus group, near Golden.

Sierra County.

The McVey and Pallar group of six claims in Wicks Gulch, near Hillsboro, have been sold to the Black Peak G. M. Co. The company will resume work on the group. When a depth of 150 feet has been reached a steam hoist will be set up.

Socorro County.

Seventy tons of ore are being treated daily by the mill of the Mogollon G. & C. Co. at Cooney, producing six tons of high grade concentrates. The crusher, which has a capacity of 200 tons, will be in running order by Jan. 1st. Additional vanners are being set up and the mill capacity will be increased to 100 tons a day. The vein has widened in some of the stopes to 30 feet. In drifting under the creek, a body of gold-silver ore was struck. The ore is reported to contain elongated argentite crystals.

The Rosedale mine and mill at Rosedale, are in full operation, since putting in new mortars and additional machinery. ——W. Edwards, manager of the Baking Powder mine in Rosedale district, has put men to work.

OREGON.

Baker County.

At the Midway mine, near Sumpter. Superintendent S. G. Williams says work at the Midway is progressing, the 150 level having been reached, a station cut out and a crosscut started for the lode, which is 40 feet from the shaft.

Full operations are resuming at the Baisley-Elkhorn mine, Rock Creek district, near Sumptor. The crosscut, which has total length of 5000 feet, has been driven 100 feet. The water power plant on Pine creek, which will furnish power for the 16-drill compressor, near the mouth of the tunnel, and also the mill 10,000 feet farther up the canyon, are ready. The mine has been unwatered and three levels in the shaft put in condition for work. E. J. Fields is manager of the property for the Beaver Company and has men at work. More will be added.

Engines and milling machinery are on the ground for the Geiser-Hendryx Co., near Sumpter. The mill is of the Chilian roller type, of thirty tons daily capacity. The engines and boilers are for the Victor mine six-drill compressor.

Excavations for the Golden Wizard mill, near Sumpter, have been completed. This battery pit is 40x4 and 10 feet deep, in solid rock. Timber is on the ground. Superintendent McPhee says carpenters will be set to work this week.

Curry County.

The Coast Range C. Co. of Roseburg has bonded its sixteen claims on the Illinois river to F. A. Kribs for $150,000 and prospecting on the claims will begin this week.

Douglas County.

The Red Bean mine, in southern Douglas county, bonded last spring to T. B. Scott of Chicago, Ill., has reverted to its former owners, Riggs, Flamm & Evaos of Grants Pass. A cash payment of $5000 was made and 200 feet of tunneling done.

Grant County.

The Dixie Meadows concentrator has been completed and will be put in operation this week. The capacity is 100 tons. The vein is of milling ore, averaging 40 feet wide. The management has cut a raise of 140 feet between the middle and lower tunnels in ore.

L. Walker, A. Mohr et al. of Sumpter are preparing to develop their coal lands in the John Day region.

V. C. Belknap of Sumpter, manager of the Dixie Meadows G. M. Co., near Prairie City, says the machinery has been set up and the 100-ton concentrator put in operation. There are thirty men at work. In the mine men are drifting on the ore body, crosscutting, opening up stopes between upper and lower workings and stoping out ore. He says it has been ascertained that the concentrates can be treated on the ground by cyanide process, and they will put in a cyanide plant. The sawmill is cutting lumber for the buildings.

The Gold Values, Lucky Strike and Forget-Me-Not claims, near Alamo, have been sold to the Big Producer M. Co. for $9000. The property adjoins the Big Producer.

Jackson County.

J. Blazier of Portland has bought several hundred acres covering a placer gravel channel along Elliott Creek, in Upper Applegate district, near Applegate, and is preparing to work by hydraulicking.

The Cemeot mine, on the divide between the right and left forks of Jackson creek, near Jacksonville, has been leased by J. Fielder and L. Lytle. The lessees are operating a No. 1 giant from a 6-inch pipe that receives water from the Joe Black ditch fed from Cantrall gulch. The ground has to be blasted loose before using the water. —— Piping started last week at the Antonio mine on Forest creek, says Superintendent R. McGill. A No. 1 giant is used, working under a pressure of 210 feet. This mine is in an old channel of Forest creek and there is a 15-foot bank to cut off to get at the gravel.

Josephine County.

F. H. Osgood of Seattle, Wash., has bonded the Hammersley mine near Grants Pass and will increase development. He is also operating the Osgood placers on Illinois river. The Hammersley mine has been idle for several years.

The Comstock M. & M. Co., under management of J. M. Layman, is making shipments of ore from mines near Grants Pass. The ledges run 3 feet in width with assay values of $20.

The Galice Con. M. Co. last week began operations in working their placer grounds on Galice creek, near Grant's Pass, and will have three hydraulic mines in operation on Galice creek. The consolidated company is in control of nearly all the former placer mines on Galice creek, making available placer diggings covering 600 acres. The building of reservoir dams at the head of the two forks of Galice creek, the widening and extending of ditches, and the laying of 1000 feet additional of piping enables the Galice Con Co. to have three giants at work, and is in position to mine twelve hours per day, even during the summer months, says the Telegram. The company has ground and water to operate ten separate hydraulic mines. There is ground on both the upper and lower creek that has not been prospected, as it has been too high to be reached by the available water; but now high-line ditches reach every part. Ground is being moved that prospects 25 cents a yard.

Malheur County.

J. T. House, of Ontario, operating in Big Bend mining district, 18 miles from Ontario, on the Snake river, says the Moraine M. Co. has been operating a dredger for the past four months. The production has averaged twenty cents a yard from the gravel that is run through the dredger. The dredger handles 2000 yards of gravel per day.

Union County.

The Whirlwind Gold Mining & Exploration Co has been incorporated at Portland, with E. S. McComas as manager, to develop molybdenite prospects on the headwaters of the Imnaha river, 65 miles from Union. The ore also carries 2% copper and 3½% arsenic.

SOUTH CAROLINA.

Cherokee County.

(Special Correspondence).—Manager S. S. Ross, operating the tin mines at Gaffney, is shipping tin concentrates to Hayle, Cornwall, Eng. The first carload of twenty-five tons was shipped via New York on Nov. 27th, in sacks—100 pounds per sack. The ore is cassiterite. Arrangements are being made to put in additional machinery and to further open up the ore body.

Gaffney, Dec. 10.

SOUTH DAKOTA.

Custer County.

F. McLaughlin, manager of the Mile High M. Co., operating near Custer, says he is putting men to work and will resume development work. The company's holdings consist of a group of claims 9 miles northwest of Custer, near the North Star, Roosevelt & Interstate Co.'s holdings. He will continue the 100-foot shaft to depth of 300 feet and explore the veins at that depth. A hoist will be put in.

Lawrence County.

T. A. Harding, secretary of the Pluma M. Co., operating near Deadwood, in his report to the stockholders, says the company has increased its holdings from 43 to 105 acres of ground. A good water supply has been developed and a 40-stamp mill built, also a tramway connecting the mine with the mill. It has done 2800 feet of tunneling and shaft work, besides cutting several stations, retimbering working tunnels, excavating for enlargement of the mill and improving the Hawkeye mill. A cyanide plant will be added.

The Branch Mint M. & M. Co. at Galena is building a 180-ton cyanide mill in the lower end of the camp. Machinery is on the ground and is being set up, but it is not expected all arrangements will be completed at the mines and mill until next May, says J. D. Hardin, president and manager.

UTAH.

Beaver County.

S. E. Potts has a lease on the Boston mine, in Star district, near Milford.

The superintendent of the Erie M. Co., near Milford, says the drift on the 250-foot level had opened into decomposed granite, containing an ore body carrying native copper.

B. S. Woodward, president and manager of the South Granite M. Co., owning a group of seven claims east of Milford, says operations are being resumed. Considerable work has been done on the ground and ore opened up. The main tunnel has been driven 400 feet toward the ledge which it will cut at depth.

Carbon County.

Vice-president Kramer of the Utah Fuel Co. says any miner who wants to work for the Utah F. Co. must choose between the company and the Miners' Union, as they will not take back any striker so long as he is unwilling to surrender his union card. The Utah Fuel Co. controls the coal mines at Sunnyside, Winter Quarters, Schofield and Castle Gate. The company officials claim the output of the mines has nearly reached its normal figures. —— The company's payrolls for month of October showed that the 239 miners working at Winter Quarters averaged $71.85 each. At Clear Creek, 276 miners averaged $65.94 each, being a less amount than during other months on account of new track scales being put in at that point instead of weighing the coal at Scofield. This made a scarcity of mine cars for the time, and lessened the output. At Sunnyside, taking No. 1 mine alone, 229 miners averaged $67.66; and at this camp there is a large floating population. At Castle Gate 296 miners averaged $69.26 for the month. The working days were twenty-seven days at four of the camps, twenty-six days at one camp, and thirteen days at Somerset. None of the mines are operated on Sunday, and the agitators have failed, says the Deseret News, to explain in their schedules that the usual average of working days for the miners is about eighteen, entirely governed by themselves, and that where there are twenty-five working days in a month, miners generally work twenty to twenty-two days. Men lay off from various causes, some of them only earning $10 or $12 during October for that reason. The miners are paid by the ton of 2240 pounds. It was 80 and 95 cents, according to the character of the work, before the raise of Nov. 1st, but now 90 cents and $1. The management states that where (for example) 250 men are working regularly, the payroll will be found to include 290 men. At Castle Gate one miner earned $135.44, and another $130.47, and it is not unusual for regularly working miners to be credited on the payroll with $80, $90 and $100. Outside laborers now get 27½ cents per hour, or $2.20 for eight hours, as against 20 cents per hour for nine hours previously; trappers, boys, are getting $1.10, a 10-cent raise; roller men get $3.00 instead of $2.75; blacksmiths $3.46 for eight hours against $3.15 previously; and carpenters $3.30 instead of $3.00; engineers received $125, and firemen $75.——Men, mostly Americans, from outside points are being put on daily, to fill the strikers' places (the strikers are largely foreigners).

Juab County.

It is reported the Godiva M. Co., owning a group on Godiva mountain, at Eureka, will resume operations next month. J. Q. Packard is president.

The annual report of the Gemini M. Co. of Eureka shows 13,500 tons of ore sold, and dividends of $200,000 paid. J. Q. Packard is president and E. W. Packard vice-president and manager. It is intended, says Manager Packard, to resume sinking the shaft, which is down 1600 feet, under Superintendent J. McChrystal, as soon as the additional battery of boilers with 600 H. P. is installed.

Piute County.

M. F. Murray of Salt Lake City reports a strike made in the Log Cabin mine, near Marysvale. The strike was made in Log Cabin tunnel, 375 feet from the month. The ore is mixed with talc and carries values in gold and silver.

Salt Lake County.

Oil well machinery for the Guffey and Gailey oil wells north of Salt Lake City is on the ground at Farmington, and drilling operations will be started. The first well will be near the old gas wells.

Eastern oil operators last week bought 10,000 acres of land on the shores of Great Salt Lake, near Salt Lake City, and will open up oil prospects. S. T. French of Chicago, Ill., W. C. Bigger of Ohio and A. J. Wallace of Butler, Pa., are officers of the company. The land adjoins that leased by Guffey & Gailey of Pittsburg, Pa. The price paid was $50,000 cash.

The Winnemuck mill at Bingham has been overhauled and its capacity is being increased. It is expected to be ready to run on the Ohio C. Co. ore by Jan. 1. It will treat from 125 to 150 tons daily.

The Ellis Fume Arresting & Ore Reduction Co. of Salt Lake City has been incorporated, with H. R. Ellis, E. F. Fredcothall, E. A. Wall and W. S. McCornick as officers, to treat ores by arresting and recovering the valuable contents in fumes, gas and smoke.

Summit County.

The incline shaft at the Scottish Chief mine at Park City is down 500 feet, and drifting will begin.

The masonry work is completed, and the frame work is going up for the new tailings mill of the Daly-West mine at Park City. Superintendent Sherman expects the plant will be in operation by March 1st. The plant will work only the tailings of the present mill, and by a series of tanks and tables will furnish concentrates that are expected to net the company $50,000 a year. The capacity of the plant will be 400 tons a day, and six men—two on a shift—will be required to operate it.

President Kearns has contracted for the entire output of the Kearns-Keith mines and mill at Park City, including ore and concentrates, to be forwarded to the furnaces of the American S. & R. Co. The mill was put in operation last week by Manager M. J. Daily.

Utah County.

S. B. Brillhart, who, with Boston men, is developing ozocerite deposits at Soldier Summit, reports work going ahead. They are operating at Colton.

The Summit Placer Co., which has also hydrocarbon deposits at Soldier Summit, has been prospecting its ledges with a view to sinking a working shaft and opening up several ledges in which ozocerite occurs.

Washington County.

The Utah & Eastern M. Co., operating the Dixie mines and smelter near St. George, will provide it with better means for transportation of ore between the mine and furnaces, and will build a gravity tramway. It will be 2200 feet in length, and the railway will be 1¼ mile. Mules will be used on the railroad. At present the ore is hauled by teams.

WASHINGTON.

Chelan County.

Chelan reports say, at Doubtful lake, near Cascade pass, the tunnel on the Quien Sahe mine, owned by the Cascade Con. M. & S. Co., is in 230 feet, and has a pay streak for that distance averaging 18 inches of galena. The Boston, 2 miles from the Quien Sabe, is improving. An ore shoot averaging 3 feet in width of galena is being opened up. Two tunnels, one 80 feet and the other 60 feet, have been run.

Ferry County.

(Special Correspondence).—During the summer months from 5000 to 7000 tons were shipped from Republic per month. Now the amount is about 4000. While good is anticipated by the introduction of the new cyanide process, a new smelter, located at some convenient point to Republic, is a necessity, as the mines will be handicapped until such a plant is in operation. There are fifteen mines developed to depths of from 260 to 650 feet. The veins are from 3 to 30 feet in width. More than 50,000 tons of ore have been mined and shipped the present year, and yet the ore reserves are nearly double what they were at the beginning of 1903. Two lines of railroad afford ample transportation facilities. The ores of this camp are not, strictly speaking, smelting ores, but at the Belcher camp, a few miles distant, there are veins of iron, copper and gold ores, a splendid blend for smelting.

The Quilp mine is shipping sixty tons daily to the Tacoma smelter. The principal part of the work in the mine is being carried on at the 500-foot level.

The Mountain Lion has shipped 200 tons per day for some months, but has been compelled to curtail its output about 50% on account of orders from the smelters to do so.

The Knob Hill is shipping two cars per week. Men are engaged developing the property between the 250 and 150 levels, and on the 250-foot level.

Republic, Dec. 15.

E. H. Hanford, of Seattle, is working men on the Mountain View group near Park City, near Republic. They have driven a tunnel 250 feet and expect to tap the Teague vein at 200 feet farther. They have a 5-foot vein which dips toward the mouth of the tunnel and carries values in gold, silver, copper and lead.

R. Purcell, operating at Park City, near Republic, says he has been tunneling to

cut his vein. The tunnel is in 60 feet and has 100 feet farther to run to tap the vein at depth of 60 feet. It will drain the mine and admit of further development of the vein.

Pierce County.

Olympia reports say at depth of 1300 feet below the surface, the Great Western Coal Co. has struck a promising body of lignite coal, which is as hard and smooth as anthracite. Shipments have begun. The owners have made a shipment for official test in the United States Navy, to the Port Orchard navy yard.

WYOMING.

Bighorn County.

The Bonanza Oil & Dev. Co. has struck a flow of oil and gas in its well in the Bonanza fields, south of Basin, at a depth of 250 feet. Drilling will be continued to a depth of 1000 feet. The Bonanza Co. is made up of Omaha, Neb., Basin and Cheyenne men.

Fremont County.

The Carisa mine at South Pass is reported sold to Ewing et al., of Salt Lake City, Utah, for $200,000. Development work will be increased. The Carisa was a former gold producer.

Natrona County.

The Belgo-American Drilling Trust has bought the entire holdings of the Pennsylvania Oil Co. in Wyoming, including the refinery at Casper. The Shannon properties are also included in the deal. Development work on all these holdings is progressing.

FOREIGN.

AFRICA.

Soudan.

Nitrate of soda deposits are claimed to exist extending over all the west of the Sahara desert from Adar to the coast of the Atlantic and south of Morocco.

AUSTRALIA.

New South Wales.

Ashestos is heing mined at the Ashestos mine on Jones Creek, near Gundagai, which is heing reopened by Victoria men.

Western Australia.

Two additions to the list of Murchison gold producers last month were the Cue G. M. & Ex. Co. and Murchison Associated Co. The Cue G. M. & Ex. Co. has its 20-stamp battery crushing rock from the Kinsella lease, the ore averaging 20s per ton. It is expected 2500 tons per month will he handled.——The Murchison Associated has its battery in operation. Two shafts are heing sunk to a depth of 500 feet, when levels will be driven to connect them and the ore blocked out.

The Mines Department reports a total of 3935 stamps dropping in the camps of Western Australia, including: East Coolgardie district (Kalgoorlie), 570 stamps; Coolgardie, 366; Mt. Malcolm, 251; East Murchison, 230, and Broad Arrow district, 220.

BRITISH COLUMBIA.

Boundary District.

Oporations at the Cariboo mine, at Camp McKinney, have been temporarily suspended, and in the meantime it is expected the plant for treating the ore will be increased.

The additional steam shovel ordered by the management of the Granby mines at Phœuix has heen put at work at the No. 1 level, where No. 1 shovel is at work. The new shovel is larger than No. 1, having a hucket capacity of 1500 tons daily. With the C. P. R. steam shovel, this makes three of these machines employed in shoveling ore in the Granby mines. Repairs having been completed to the two 30-drill air compressors, hoth are in operation.

East Kootenay District.

The car famine at Fernie and Michel has been relieved hy the C. P. R., and the coke surplus has heen moved. This will enahle the Crow's Nest Coal Co. to increaso its output.

Rossland District.

Manager Thompson of the Kootenay mine, at Rossland, says his company will build a mill to reduce low-grade iron ores during the coming year.——The Velvet mine will put in a system of concentration. The product of the mine is said to be pyrite, capable of being reduced by the pyritic smeltiug system to a concentrate in the form of matte.

The hoist at the White Bear mine, at Rossland, is being set up, after which it is expected the mine will start shipments. The Spokane Falls & Northern R. R. has laid a spur to the mine. With this hoist the White Bear can continue development to the 1500-foot level.

Slocan District.

As soon as rawhiding starts, the Reco, Blue Bird and Sovereign mines will join the list of Sandon shippors.——The Hope mine, at Sandon, has opened up an ore body showing 8 feet thick in the face, and has heen drifted on 40 feet. Ore is heing shipped.

West Kootenay District.

The reorganization of the Northwestern Dev. Syndicate has been completed at Calumet, Mich., and E. Ulseth is president, with J. Herman, I. Frimodig, W. F. James, J. C. Light, A. R. Rosenherger, F. Roehm, W. London, W. Cleaves and J. Vertim directors. A. R. Rosenherger is manager and says operations will he resumed.

R. K. Floeter and J. A. Darragh have an option on the Homestead group, on Mohawk creek, in the Fish creek helt, near Ferguson.

C. Ehlers, with Rossland men, is reported to have taken up the Beauflot (Buffalo) group at Second Crossing, in Poplar Creek section, on a $45,000 hond.

CANADA.

Alberta.

The Anglo-French syndicate, J. J. Fleutot manager, has hought for $125,000 the Proctor-Fishburn coal lands at Blairmore, near the British Columbia line. Other coal land deals in the Crow's Nest Pass district are reported undor way.

KLONDIKE.

H. E. Porter of Whitehorse reports finding a natural flowing petroleum seepage on the left limit of Bullion creek, 1200 feet from the creek, near Whitehorse.—— A. R. Gordon and P. F. Hogan located a coal vein in Sheep creek, which outcrops and parallels the creek for ½ a mile.

MEXICO.

Chihuahua.

The reduction plant on the Lluvia de Oro mine, near San Andres del Rio, is reported treating fifty tons of ore daily. The management has plans under way for huilding a railroad from the mines to the port of Topolohampo, the southern terminus of the Kansas City, Mexican & Orient road, which is huilding.

Work will he resumed on the Columbia mine, owned hy the Federal C. Co., at Terrazas, this month.

Coahuila.

A smelter will he huilt in Torreon hy the American-Mexico M. & D. Co., says W. S. Dillon of Chicago, Ill., of the company.

Jalisco.

Machinery for the reduction plant, with hoilers, air compressors, drills, etc., is on the ground for the Amparo group, near Etzatlan. Dovelopment work is heing increased to open up the ore bodies, says Superintendent G. J. Graham.

Mexico.

Ore from the Santa Rosalia mine, located in Temascaltepec district, 80 kilometers west from San Juan de las Huertas, is heing shipped to the Guadalupe smelter at Sultepec to determine method of treatment. The company proposes to build its own plant. The property is heing developed through two tunnels and is opening up ore which assays $100 per ton, says Manager B. T. Davis.

At El Oro mine, at El Oro, progress is heing made on the fouudations for the 100-stamp mill. Among the features that will characterize the mill will he helt conveyors for handling the material in the cyanide department, Krupp harrel mills for regrinding the pulp hefore treatment in the cyanide tanks and the placing of all pumps used in the plant in one house.

Michoacan.

Chicago, Ill., men who recently hought the Santiago y Anexas group at Tlalpujahua will huild a 100-ton stamp mill and increase development work. There are 150 men employed, cleaning out the tunnels, shafts and retimbering.

At Tlalpujahua, at the Dos Estrellas mine, the crushing capacity of the 1250-pound stamps in the new plant is reported so much greater than had been figured that the cyanide plant is unahle to treat the output of the full eighty stamps. The output from fifty stamps is all that it can handle, and until eight additional cyanide tanks are put in fifty stamps only will he kept dropping. Development work in the two tunnels, in sinking the two shafts to tap the latter, etc., is progressing. Belt conveyors will be put in to carry the ore from the workings to the crushers.

Oaxaca.

The Dona Carmen M. Co. expects to hegin work on its Dona Carmen group in Ejutla district, 5 kilometers south of San Martin, by Jan. 1st. The group consists of four properties, and on two of them considerahle development work has been done. On the La Providencia a tunnel in 80 feet shows up a hody of ore carrying gold, silver and copper which is said to assay $60 gold.

Sinaloa.

E. T. LeClair et al. of Milwaukee, Wis., operating a group of gold and silver claims at Choix, are preparing to put in additional machinery and increase development work.

Sonora.

V. Aguilar has hought the Amarillas mine, an antigua, 18 miles east from Posa station, and is unwatering the workings, preparatory to prospecting the property.

The Greene Con. C. Co. is planning to build a custom smelter at Cananea in addition to its seven private plants there. The Con. C. Co. is producing 50,000,000 pounds of copper a year with its smelters at Cananea from ore taken entirely from the company's mines.

Tamaulipas.

The Mexican National Oil & Dev. Co. is being reorganized hy California men, says R. Benevendo of the company, who holds leases on 500,000 acres of prospective oil land on the coast 36 miles south of Matamoros. The company will bore for oil on the Chapa tract.

Zacatecas.

The Santa Rita M. Co. will huild a 100-ton smelter at its mines at Nieves, says J. A. Carpenter of Torrington, Conn., president.

The Asturiana y Anexas group, 3 kilometers south of Zacatecas, in the district of Mexico, is heing developed through twenty shafts and one tunnel. The ore carries silver and a little gold, assaying $80.

Personal.

F. L. SMITH of Denver, Colo., is in New York on husiness.

W. M. FERRY, of Salt Lake City, is examining mines in Idaho.

W. S. GAGE has returned to San Francisco, Cal., from a trip East.

ARTHUR C. NAHL is now with the Progresso M. Co., La Paz, Baja Cal.

J. C. WILKINSON, of Salt Lake City' Utah, is in Omaha, Neb., on business.

J. GREEN of Boise, Idaho, interested in Idaho mines, is in San Francisco, Cal.

L. D. SIVYER of Spokane, Wash., is examining copper mines at Globe, Ariz.

W. A. MCKINLEY, an electrical engineer of Sonora Cal., is in San Francisco, Cal.

JUAN FELIX BRANDES of Denver, Colo., is in New York City on mining husiness.

W. F. MITCHELL of Salt Lake City, Utah, is in San Francisco, Cal., on mining business.

J. F. YERINGTON of Carson City, Nev., interested in Nevada mines, is in San Francisco, Cal.

A. POE is superintendent of the Tom Smith mine, near Sheep Ranch, Calaveras Co., Cal.

G. D. HAZARD of Denver, Colo., has returned from Chicago, Ill., and other Eastern points.

J. H. HARN is superintendent of La Fortuna group of mines at Silver King, Pinal county, Ariz.

G. SURR of Los Angeles, Cal., has gone to Searchlight, Nev., as assayer for the Cyrus Nohle mines.

S. G. WILLIAMS is superintendent of the Midway mine, near Sumpter, Or., vice L. Walker, resigned.

G. MCM. ROSS, a mining superintendent of Virginia City, Nev., is in San Francisco, Cal., on husiness.

G. Z. EDWARDS returned last week to Salt Lake City, Utah, from an examination of mines in Nevada.

J. H. WEBER goes East from San Francisco, Cal., in the interest of the Bohemia, Or., mining district.

J. J. CRAWFORD, E. M., has returned to San Francisco, Cal., from the Gwin mine, Calaveras county, Cal.

W. G. FILER of the Western Exploration Co. returned to Salt Lake City, Utah, last week from Idaho.

A. MALTMAN is superintendent of the Murchie mine, near Nevada City, Cal., vice J. C. Camphell, resigned.

E. RAUTMAN of Prescott, Ariz., president of the Bunker Hill M. Co., is in St. Louis, Mo., on mining husiness.

S. B. BRILLHART, operating ozocerite mines at Soldier Summit, Utah county, Utah, is in the East on husiness.

MANAGER O. C. JACKLING of the Utah C. Co. returned last week to Salt Lake City, Utah, from Colorado.

W. P. HAMMON, engaged in gold dredger mini g near Oroville, Cal., is in San Francisco, Cal., on husiness.

L. MARKS, part owner of the Laverona mines near Terrazas, Chihuahua, Mexico, is in England on mining business.

F. MCLAUGHLIN, manager of the Mile High M. Co., operating near Custer, S. D., returned last week from a trip East.

CHAS. DOBLER, superintendent of Brown Bear, Deadwood, Cal., will he in San Francisco, Cal., till April 1, 1904.

L. H. CARVER, E. M., of San Francisco, Cal., has gone to Sierra City, Cal., to start operations at the Mountain mine.

P. PORTER, manager of the Keystone group of mines at Cortez, Eureka county, Nev., is in camp from Salt Lake City, Utah.

J. A. MEIGHAN, superintendent of the Mt. Jefferson mine at Groveland, Tuolumne county, Cal., is in San Francisco, Cal.

F. B. WILSON, president of the Ruhy G. & C. Co., is at their mines near Guaymas, Sonora, Mexico, from Nogales, Ariz.

C. E. LOOSE of Salt Lake City, Utah, manager of the Grand Central M. Co., returned last week from a trip to California.

L. SANDER of Liege, Belgium, of the Belgian and Rhenish smelters, is in Leadville, Colo., looking over the zinc mining situation.

F. H. JACKSON of Los Angeles, Cal., manager of the Colton cement works, has returned to Los Angeles from San Francisco, Cal.

C. N. TIBBITTS, assistant general manager of the Mine & Smelter Supply Co., has returned to Denver, Colo., from El Paso, Texas.

JOHN ROSS, JR., superintendent of the Wildman-Mahoney mine, Sutter Creek, Cal., has gone to Siskiyou county, Cal., to examine mining property.

M. T. YERKES, president of the Yerkes M. Co., operating El Cajon de Amarillas mine, in Altar district, Sonora, Mexico, is at the mine from Philadelphia, Pa.

M. H. LIPMAN of Hailey, Blaine Co., Idaho, manager of the Lipman Tunnel Co., returned there last week from a husiness trip to Boise City, Idaho.

L. WALKER has resigned as superintendent of the Midway mine, near Sumpter, Or., and will manage a group of coal prospects in the John Day region.

A. MCKEOWEN of Berkeley, Cal., will leave next week for Mexico, as assistant mineralogist and sampler at the Esperanza mine, near Cocospera, Sonora.

H. L. ARCHER of Minneapolis, Minn., manager of the Colonial M. Co. interests in California, has returned from a trip to San Francisco and Plumas county, Cal.

J. C. CAMPBELL has resigned as superintendent of the Murchie mine, near Nevada City, Cal., to devote his time to reopening the Mountaineer mino, also near Nevada City.

H. C. ROLFE, president of the Calumet & Yaqui C. Co., which is developing copper properties near Soyopa, Sonora, Mexico, has estahlished his headquarters at La Colorada, Sonora.

W. F. SNYDER AND P. L. KIMBERLY of the Western Exploration Co. returned to Salt Lake City, Utah, last week, from their San Francisco, Cal., trip, and Kimherly has gone East.

J. F. GILES, president of the Sierra M. Co., operating at the Del Monte mine, returned last week to Groveland, Tuolumne Co., Cal., from a two weeks' stay in the southern part of the State.

CHAS. W. RAYMOND has returned to San Francisco, Cal., from an examination of mining property in White Hills mining district, Arizona. This work was done for Minnesota men, and will result in development work thereon.

THE following engineers of the U. S. Reclamation Service are in Washington, D. C., for the winter, preparing reports of the field work of the past season: Cyrus C. Bahh, in charge of St. Mary's project, Montana; John T. Whistler, district engineer, Oregon; Charles H. Fitch, district engineer, South Dakota; Jeremiah Ahern, engineer Wyoming work; Frank E. Weymouth, engineer South Dakota work.

Books Received.

"Care and Handling of Electric Plants," is the title of a neat little volume, by N. H. Schneider. It is devoted to practical information for those who are called upon to operate a commercial or military electric plant, without having had previous experience. The volume also contains much of valuo to the engineer. One particular feature is its treatment of incandescent lamps. It contains 66 illustrations, with 116 pages. Bound in red morocco. Price, $1.00. Spon & Chamberlain, 123 Liberty street, New York City.

Obituary.

J. BECK, a pioneer miner of Madera county, Cal., owning a group of claims in the "Minarets," died on the 8th inst. at Madera, Cal., death resulting from a general breaking down due to old age.

JAMES O'KEEFE, a pioneer mining man of Hinsdale county, Colo., died Nov. 30 at Lake City, Colo. He was formerly connected with the Crooke smelter and also the Ute & Ulay Co. Deceased was 55 years old.

N. S. LEWIS, a pioneer miner of Nevada, died at Searchlight, Lincoln county, Nev., on the 3rd inst., the result of a stroke of apoplexy. Deceased was 73 years of age; and forty years ago he located the Wall Street group of mines at El Dorado, near Searchlight.

J. B. MCARTHUR, formerly of Rossland, B. C., and a mining operator throughout the Kootenays, died at Toronto, Canada, on the 7th inst. Deceased was 54 years of age. For the past ten years he has been connected with mining interests in the Kootenays, British Columbia, and was at one time part owner in the Rambler-Cariboo mine.

J. KINNIKIN, a pioneer miner of the Comstock, died at Virginia City, Nev., on the 9th inst. from asthma and miners' consumption. Deceased was formerly employed in the Yellow Jacket mine. At the last election he was chosen Recorder and Auditor. He was a native of St. Louis, Mo., aged 43 years, and leaves a wife and five children.

Catalogues Received.

"Hardware Specialties" is finely illustrative of special brands of tools supplied by the Pacific Hardware & Steel Co. of San Francisco, Cal.

"Power Problems" is an edition de luxe of a series of unusually fine illustrations portraying the economic systems of power transmission placed by the Power Installation Co. of Buffalo, N. Y., Geo. F. Wescott vice-president and general manager. There is no description—just the pictures, which talk for themselves. On alternate pages are snappy little trade maxims, which keep one turning the leaves to read them; each one a text in itself. The publication is a unique one and commendable.

A new line of air compressors is described in Bulletin L-509, issued by the Laidlaw-Dunn-Gordon Co., 114 Liberty street, New York City. Those compressors are fitted with Meyer steam-valve gears, permitting of an adjustable cut off. The air ends are arranged both with poppet inlet and outlet valves and with mechanically operated inlet and poppet outlet valves, the valves in either case being placed in the head of the cylinder, permitting the body to be effectively water-jacketed. The frames of the compressors are specially heavy. The capacities listed range from 468 to 2220 cubic feet of free air per minute, and the air pressures from 80 to 100 pounds per square inch. This pamphlet will be sent upon request to those interested.

Commercial Paragraphs.

THE Fraser & Chalmers Co., Ltd., of London, have obtained the South African agency for the sale of the Kinkead mill.

FAIRBANKS, MORSE & CO., through their Denver, Colo., house, have sold and shipped a number of gasoline hoisting plants the past week.

REDFIELD DRILL CO., Denver, Colo., has shipped one of their hand power rock drills to B. K. Walker, Como, Colo.; one to Bethmann & Jack, Greer, Idaho; one to N. T. Johnson, Burke, Idaho.

THE Mine & Smelter Supply Co., Denver, Colo., recently sold two 8-drill "Cincinnati" air compressors, one going to Boulder, Colo., and the other to South Dakota. They also report an increase in the Wilfley table business.

THE Rogers Engineering Co. has established offices and salesrooms at 109-111 New Montgomery street, San Francisco, Cal., as Pacific Coast agents for the Model gasoline (stationary, pumping and hoisting) engines, and the Buffalo gasoline marine engines; and as manufacturers of the Stimson patent steam and gasoline motors and power drag saws, the Rogers concentrating tables; and as builders of mining, milling and smelting machinery.

THE American Steam Gauge & Valve Mfg. Co. have again been compelled to seek new quarters, owing to the increase of their business, and are at present removing their entire plant and offices from Bismarck St., Roxbury district, to the large brick buildings, 208-220 Camden St., Boston, Mass. The buildings have floor space of 85,000 square feet. The Mowry & Phillips foundry department will also be removed from south Boston and every branch of the business consolidated at the Camden St. factory. The new plant will afford them more than double the present capacity, and will be employed in producing their valves, gauges and indicators, also special metals and foundry work in the Mowry & Phillips department.

THE Hendrie & Bolthoff Mfg. & Supply Co., Denver, Colo., have just shipped one of their new first motion hoists to the Copper Queen mine, Bisbee, A. T. The Gum Tree mine, Idaho Springs, Colo., is installing a new Bolthoff first motion hoist furnished by the Hendrie & Bolthoff Mfg. & Supply Co. The Mayflower mine, Telluride, Colo., is putting in a Hendrie & Bolthoff Mfg. & Supply Co. double drum electric hoist. A first motion hoist, also furnished by the Hendrie & Bolthoff Mfg. & Supply Co., is being installed at the Leyden Coal mine, near Denver, and an air compressor and complete equipment has been shipped to the Raymond Con. M. Co., Gunnison county, Colo., by the Hendrie & Bolthoff Mfg. & Supply Co.

THE Lagonda Mfg. Co. of Springfield, Ohio, manufacturers of tube cleaners and boiler-room and steam specialties, have established an Eastern office at 123 Liberty St., New York City. This will be in charge of Mr. H. A. Freeman, who has been connected with the Lagonda people for some time. The demand for their goods, especially in the East, having grown so steadily, it has been found necessary to establish headquarters there, where machines could be kept in stock, and from which information could be promptly furnished. Mr. Freeman has extended acquaintance among the engineers and steam users in the Eastern territory, and will be glad to meet any of his old friends or any who may be interested in the machines he represents.

The Colorado Company Wins.

Verdict Against California King Gold Mines Co. for $40,000.

[From the Los Angeles, Cal., Herald, Dec. 10, 1903.]

The stubbornly contested case which has been on trial for the last five weeks before Judge M. T. Allen and a jury in Department 6 of the Superior Court resulted, yesterday morning, in a verdict for the plaintiff for $40,000, the full amount sued for.

The Colorado Iron Works Company of Denver, manufacturers of mining machinery, brought suit against the California King Gold Mines Company to collect a balance claimed to be due on the contract price of a crushing and cyanide plant erected by the Iron Works Company for defendant, at Picacho, Cal., above Yuma, on the Colorado river. The contract price was $150,000, on which only $110,000 was said to have been paid.

The California King Company claimed that the Colorado company had not completed its contract, that the capacity of the mill was not up to the guaranty of 1000 tons per day, that the workmanship was poor, and that there had been delay in the work, by reason of which the defendant claimed it should not pay the balance of contract price and in addition claimed $100,000 damages.

The verdict of the jury is a complete vindication of the Colorado Iron Works and of its New York manager, S. W. Traylor, who designed the mill and made the contract sued on. The plaintiff is given all it asked and the defendant's claim for damages is ignored.

The Colorado Iron Works Company has been engaged in the manufacture of smelters and mining and milling machinery, at Denver, for the last thirty years. It has built some of the largest and most successful plants in the country. Its president is John W. Nesmith, one of the pioneer citizens of Colorado. In addition to its main office in Denver, it maintains an office in New York City, under the management of S. W. Traylor, and has recently opened an office in this city, in the O. T. Johnson building, under the management of H. R. Ayres.

Andrew W. Gillette of Denver, the general counsel for the Iron Works Company, and Judge H. C. Dillon of this city were the successful attorneys for the plaintiff in the cause just concluded. The defendant company was ably represented by Hon. John D. Works, late Judge of the California Supreme Court, and by Hon. Bradner W. Lee. Ex-U. S Senators Stephen W. Dorsey and R. T. Pettigrew, the latter being vice-president and managing director of the California King Company, figured prominently in the trial.

Whether the judgment will be paid or appealed to the Supreme Court remains to be seen. The defendant reserved the usual exception and gave notice of an appeal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

NON-REFILLABLE BOTTLE.—No. 745,566. Dec. 1, 1903. I. N. Burke, Butcher Ranch, Cal.; one-half assigned to E. C. Kavanaugh, Forest Hill, Cal. This invention consists of a bottle having a substantially cylindrical neck opening, of a valve casing seated in said opening, the external periphery of said casing and the internal periphery of said neck correspondingly grooved, and a transversely corrugated bandspring engaging in said grooves to lock the casing permanently in the bottle, said casing inclosing a valve chamber, and a valve and valve seat having non-registering ports.

REFLECTOR ATTACHMENTS FOR OVENS.—No. 746,203. Dec. 8, 1903. W. C. Trowbridge, San Francisco, Cal. This invention relates to improvements in attachments for gas stoves and the like whereby the condition of the flame may be easily ascertained without the necessity of stooping or bending in order to look into the chamber in which the burner is usually inclosed. A plurality of reflectors may be employed if desired and are so located as to be protected from heat by the constant indraft.

RACKING BUNGS.—No. 746,386. Dec. 8, 1903. C. L. Schalitz, San Francisco, Cal. This invention is designed for the filling of casks and the like and the transfer of the liquid to a subsequent cask or casks without the attention of an operator. It consists of an integral casting having a closed top and internal chamber, and a partition integral with and depending from the inner side of the top and terminating at substantially the bottom of the casting and dividing one side of the chamber from the other, said casting having an opening in each side wall near the top, one of said openings serving as an inlet and the other as an outlet.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific Coast inventors:

FOR THE WEEK ENDING DECEMBER 8, 1903.

746,273.—CUTOUT—Borein & Desimone, Oakland, Cal.
746,033.—WAFFLE IRON—Q. Crane, San Diego, Cal.
746,811.—COOLING BOARD—A. H. Emigh, Santa Barbara, Cal.
746,054.—HINGE—A. F. Enquist, S. F.
746,627.—STAMP AFFIXER—S. Farmer, Portland, Or.
746,507.—THRESHER FEEDER—J. F. Henner, Haines, Or.
746,089.—SEPARATOR—R. W. Jessup, S. F.
746,104.—PULVERIZER—J. Q. A. King, Phœnix, Ariz.
746,343.—ENGINE—G. A. Krohn, Coarse Gold, Cal.
746,344.—PUMP—G. A. Krohn, Coarse Gold, Cal.
746,365.—BICYCLE LOCK—W. T. McNary, San Jose, Cal.
746,135.—HITCHING DEVICE—F. Obiols, Winnemucca, Nev.
746,369.—MANUFACTURE OF STARCH—A. A. Osborn, S. F.
746,384.—SQUARE—T. P. Roy, Seattle, Wash.
746,386.—RACKING BUNG—C. L. Schalitz, S. F.
746,387.—COILING PIPE—C. L. Schalitz, S. F.
746,192.—VEHICLE BRACE—N. B. Stone, Outlook, Wash.
746,193.—PUZZLE—N. B. Stone, Outlook, Wash.
746,203.—REFLECTOR FOR OVENS—W. C. Trowbridge, S. F.
746,607.—BUGGY TOP SUPPORT—W. H. Tully, Wilbur, Wash.
746,411.—STRUCTURAL ELEMENT—O. A. Turner, Los Angeles, Cal.

Latest Market Reports.

SAN FRANCISCO, December 18, 1903.

METALS.

SILVER.—Per oz., Troy: London, 27½d (standard ounce, 925 fine); New York, bar silver, 55⅝c, refined (1000 fine): San Francisco, 55⅝c; Mexican dollars, 43@45c San Francisco, 42c New York.

COPPER.—New York: Standard, $12.50; Lake, 1 to 3 casks, $12.50; Electrolytic, 1 to 3 casks, $12.25; Casting, 1 to 3 casks, $12.25; San Francisco: $15.00. Mill copper plates, $17.00; bars, 18@24c. London: £57 5d spot per ton.

Copper has shown a decided decline for several weeks past. At one time during this period it was thought the price would advance by reason of the closing of the Amalgamated mines at Butte, Mont., but as the shutdown was only temporary it affected the market only slightly. The exports of Chile copper to England during 1903 have been heavier than in past years. In 1901 this amounted to 23,138 tons, which decreased to 21,109 tons in 1902. In the first eight months of 1903 the shipments reached 19,475 tons, with charters to Nov. 30 of 7900 more, making a total for the first eleven months of the year of 27,375 tons. The total output for the year was nearly 30,000 tons. The total stock reported in London Dec. 1, 1903, was 6368 tons. To be added to this is copper afloat in vessels from Chile and Australia, 6375 tons, making a total visible supply in England, Dec. 1, of 12,743 tons.

Following are the figures of the German consumption of foreign copper for the months January-October, 1903, compared with the same period of 1902 and 1901:

	1903.	1902.	1901.
Imports, tons	70,958	68,815	54,531
Exports, tons	8,477	7,516	8,322
Consumption, tons	62,481	61,299	46,209

LEAD.—New York, $4.37½; Salt Lake City, $3.50; St. Louis, $4.00; San Francisco, $4.50, carload lots; 4¾c 1000 to 4000 lbs.; pipe 6½, sheet 7, bar 5¾c: pig, $4.75. London: £11 6s 3d ₱ long ton.

LITHARGE.—Pure, in 25-lb. bags, 8@9c ₱ lb.

BORAX.—Concentrated, 6@7c ₱ lb; pow-

dered, 8@10c; fused, 20@25c; crystal, 7c; calcined, 25c.

MANGANESE.—Pure, ℔ lb., 60c.

SODIUM.—Metal, ℔ lb., $1.00.

BISMUTH.—Subnitrate, ℔ lb., $1.75.

MERCURY.—Bichloride, ℔ lb., 90c.

MOLYBDENUM.—$2.00 ℔ lb.

CHROMIUM.—90% and over, ℔ lb., $1.00.

PHOSPHORUS.—American, ℔ lb., 75c.

SILVER.—Chloride, ℔ oz., 90c@$1.00; nitrate, 55c.

ALUMINUM.—No. 1., 99%, small lots, 37c ℔ lb.; 100 lbs., 35c; 1000 lbs, 34c; ton lots and over, 33c, Pittsburg. No. 2, 90%, small lots, 34c; ton lots and over, 31c, Pittsburg.

URANIUM.—Oxide, ℔ lb., $3.50.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

WANTED.

Second-Hand Lathe,

NOT MORE THAN 3 FEET BETWEEN CENTERS. Address, giving description of lathe, also condition—and drill press and machinist's tools, if had—J. O. ROLLINS, Tuolumne, Cal.

PYRITES,

WITH A HIGH PERCENTAGE OF SULPHUR. Write, giving full particulars, to West. Chem. Co., 3214 Twenty-fifth St., San Francisco.

ASSESSMENT NOTICES.

MAYDAY GOLD MINING COMPANY.—LOCATION of principal place of business, San Francisco, California; location of works, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 9th day of November, 1903, an assessment (No. 1) of three cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, at Heald's Business College, No. 24 Post street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 14th day of December, 1903, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 18th day of January, 1904, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

EDWARD H. STEARNS, Secretary.

Office of the Company, Heald's Business College, No. 24 Post street, San Francisco, California.

POSTPONEMENT.

The day of delinquency in the above assessment has been postponed to January 11th, 1904, and the day of sale to Wednesday, February 17th, 1904.

By order of the Board of Directors.

EDWARD H. STEARNS, Secretary.

Office of the Company, Heald's Business College, No. 24 Post street, San Francisco, California.

TANANA MINING COMPANY—LOCATION OF principal place of business, San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 11th day of December, 1903, an assessmeot (No. 7) of four (4) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at his office, Rooms 404-405 of the Call Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 18th day of January, 1904, will he delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 29th day of February, 1904, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

THEO. AUDEL & CO.
63 Fifth Avenue, New York City.

SITUATIONS WANTED.

A COMPETENT MILLMAN OF 10 YEARS' EXperience would like to take charge of a mill in any part of the country, understanding cyaniding thoroughly. Wife would like to take charge of boarding house at same place. Address W. G., care of Mining and Scientific Press.

A PRACTICAL MINING MAN DESIRES TO associate himself with a reliable company. Has had twenty years experience, during which time he has worked regular shifts in every department in mill and mine; the past six years has held position of Superintendent and Manager of property working 250 men.

Practical—not theoretical—knowledge of construction and operation of mills, aerial and surface tramways, power transmission, installation of boilers and machinery, shaft sinking, mine timbering, assaying, etc. References from present and former employers.

Address "Resolute," care Mining and Scientific Press, San Francisco, Cal.

CAPABLE BUSINESS MAN WISHES CONnection with an estate or company having land or mining interests, and office in San Francisco. Now holds responsible position with wealthy concern; d. sires to change next year to a business offering opportunities for advancement to executive position. Speaks German. Full investigation courted. Confidential correspondence solicited. Address "Effort," care of Mining and Scientific Press.

ENGINEER DESIRES POSITION AS SUPERintendent of mining. Best experience obtained in Idaho, Butte, Utah and Colorado. Excellent references. Address T. Worth Bowen, Butte, Mont.

EXPERIENCED SUPERINTENDENT, ENGIneer, Metallurgist; technically and liberally educated; 15 years handling men and machinery of smelters, mills and mines. See testimonials. Address Prof. Stickney, Mountain View, Cal.

EXPERIENCED MILLMAN WISHES POSItion. Address Box 202, Enterprise, Cal.

MANAGER LARGE GOLD MINING AND milling company in Arizona desires to change his location and obtain similar position with desirable company elsewhere. Best of references from present employers. Address I. C., this office.

MANAGER OR SUPERINTENDENT. ADvertiser has had twenty years experience in Mexico, California and Colorado in mine operating and mill management. Fully conversant with the installation of power plants, aerial tramways, erection and running mills, shaft sinking, mine timbering, diamond drill work, etc. Understands the management of men as well as machinery, and can obtain first-class results.

Seven years of successful work in present locality. Desire a change. Disengaged January 1, 1904. Highest references as to ability, responsibility, practical and technical knowledge.

Address "Industry," care Mining and Scientific Press, San Francisco, Cal.

MANY TIMES DURING THE PAST TWENTY years I have been engaged in reconstructing mills to make possible a closer saving; in alteriog aerial tramways to cheapen transportation; in changing mining methods to make possible cheap ore extraction.

Have you any trouble about your plant? Do you contemplate changing or enlarging your works? Is the extraction of ore costing you too much? With my working knowledge and experience I can overcome your difficulties. Permanent situation with first-class metal mining company preferred. No objection to foreign country. Highest references as to ability, honesty and responsibility. Address "Dividend," care Mining and Scientific Press, San Francisco, Cal.

MINING ENGINEER AND METALLURGIST, graduate of German University, with large experience in the treatment of refractory gold ores by all processes, desires position with good company. Cyaniding and treatment of slimes a specialty. Age 33. Excellent references. Address N. W. 43, care of Mining and Scientific Press.

MINING ENGINEER AND METALLURGIST, with sixteen years of practical experience as superintendent, manager and consulting engineer of mines and mills, desires position on or after January 1st. Speaks Spanish fluently. Address P. O. Box 77, Durango, Mex.

POSITION WANTED BY NEW YORK ELECtrical engineer with Pacific Coast company. Experienced in construction work and selling. A position where he can work into the selling end preferred. References from company with which he is now connected. Address G. P., this office.

SUPERINTENDENT IS OPEN FOR POSITION to develop gold or copper properties; experienced miner; can make underground maps and models, also do the assaying; speaks Spanish; good references from past companies. Address "Develop," care this office.

SUPERINTENDENT, COMPETENT ASSAYER, Chemist and Surveyor. Special experience in development work; free or base ores; millman. Equipment complete. Address "Seattle," this office.

WANTED—POSITION AS SUPERINTENDENT or assistant of copper mines and smelters; competent all round man, good assayer, analyst and draughtsman; can handle labor; speaks Spanish. Address "Smelter," care this office.

WANTED—POSITION BY A MAN WHO HAS had 15 years experience in mining; 8 years as Superintendent. Speaks Spanish. Address "M," this office.

WANTED—POSITION AS ASSAYER, BOOKkeeper and Stenographer with mining company or firm in mining town. Wistrand, Oakland, Cal.

HELP WANTED.

A GOOD OPENING IS OFFERED TO A MAN OF engineering knowledge, with a large concern manufacturing power transmitting and conveying machinery, and which desires to reach the mining industry. Address Mining and Scientific Press, 1115 Monadnock Bldg., Chicago.

MACHINERY FOR SALE.

Dredger for Sale.

A clam-shell dredger used only six weeks and in first-class condition. Hatch steel bucket, capacity two cubic yards level full; boiler 48 in. x 16 ft., return tubular; main engine 12x18; spud engine 8x12, solid hed plate; two large friction hoisting drums; three friction drums for handling spuds; machine set up with frictions, clutches, traveling spud, two main spuds, hoisting and spud chains, capstan, feed pump and every part complete in every detail and ready to run; weight of all iron work and machinery 49¾ tons. Machine cost $19,500; will be sold at less than 25% of cost price.

Also: Two 3-ft. Pelton wheels, $50 each.

Two 6-ft. new Pelton wheels, double nozzles, cost $600 each. price $125 each.

Three Woodhury Concentrators. only used three weeks, price $90 each.

Address Box 29, Mining and Scientific Press, San Francisco, Cal.

A COMPLETE CONCENTRATING PLANT

Can be bought at 12c on the $1. The machinery is of the highest type and in good condition.

One 200 h. p. Corliss Type Engine. Two Safety Tube Babcock & Wilcox Boilers, about 250 h. p. One 800-lh. High Mortar 40-stamp Mill, rapid drop. One 9x15 in. Blake Crusher. Eight Tullock Automatio Ore Feeders. Twelve Double-end 3-Compartment Hartz Jigs. One 4-Compartment Single Hartz Jig. Six Sets Revolving Screens, all housed in. Two Sets of Elevators, complete. All necessary Shafting, Pulleys, Boxes, Belting and most of the piping, etc. This plant has been used very little. It cost $100,000; if sold at once, will take $12,000 for it. Located on the D. & R. G. Ry.

S. S. MACHINERY COMPANY,
1529 Lawrence St., Denver, Colo.

SECOND-HAND MACHINERY FOR SALE.

4—5-ft. Huntington Roller Mills, complete.
3 Wilfley Concentrating Tables.
1 Woodhury Concentrating Table.
1—4-ft. Pelton Water Wheel.
1—8x12-in. Rock Crusher.
1—30-ft. Hydraulic Elevator, complete.
1—1-ton Rock Car.
800 ft. Pipe, 1 in. to 4 in.; 200 ft. Rail.
1 Oertling Assay Balance, fine order.
1 pair Bullion Scales.
1 Platform Scale.
300 Sulphuret Sacks (new).

The above plant is complete and in fine shape, and will be sold as a whole or in part at half the original cost. We have ten times this amount of mining machinery on hand.

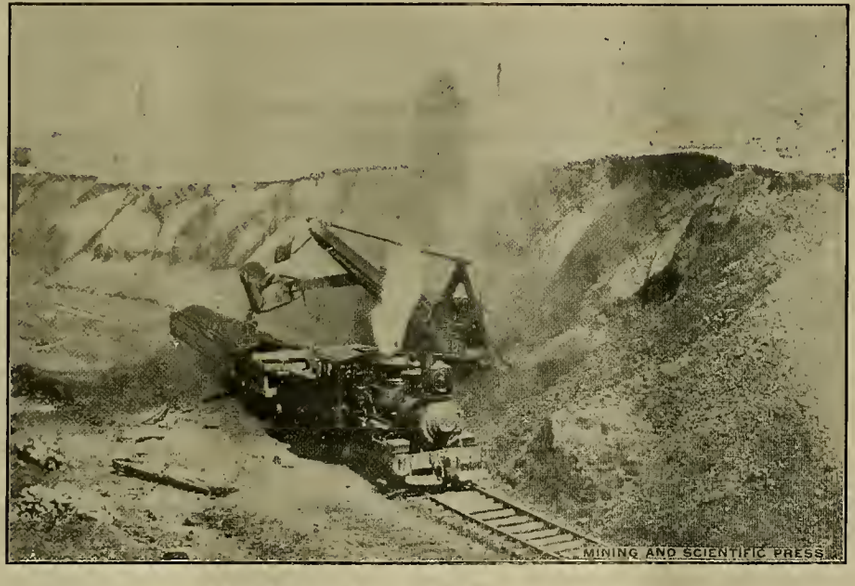
MINING AND SCIENTIFIC PRESS

Whole No. 2266.—VOLUME LXXXVII. Number 26. SAN FRANCISCO, CAL., SATURDAY, DECEMBER 26, 1903. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Sampling and Averaging Ores.

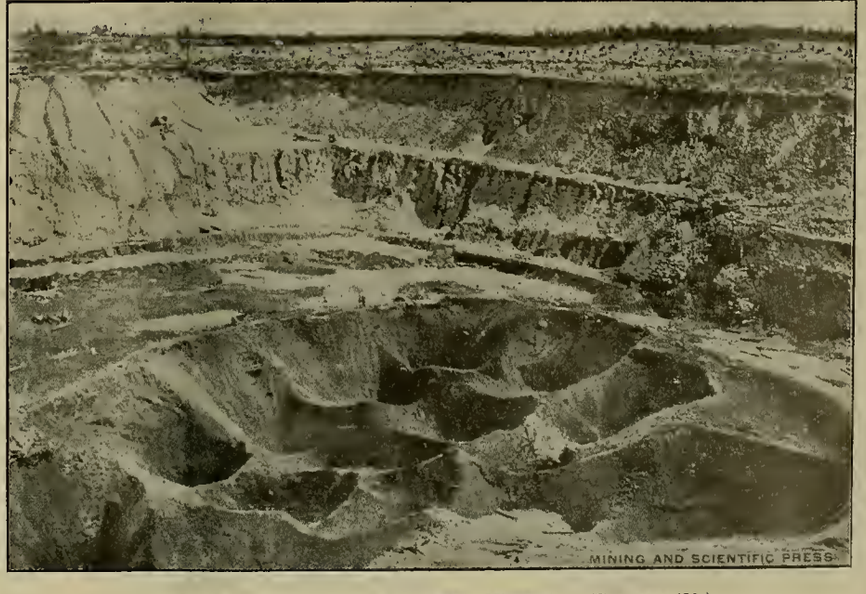
A great deal has been said and written about the sampling of mines under examination, but little has been said of the samples taken in the daily routine of a working mine. Every careful superintendent has samples taken daily in a systematic manner. The necessity for this has long since become apparent. In former days, when general results were all that were sought or expected, samples were taken more as a matter of curiosity than with a definite object in view. The most satisfactory way to work a mine is to produce an outpnt which shall vary as little as possible from month to month, but as nearly every mine has its rich and poor spots and streaks, an even output is only secured by careful sampling, and the selection of ore from those places which will in the aggregate yield a nearly uniform result. Many a manager has learned the unwisdom of making a "big run" one month, and being obliged to send ont a poor one the succeeding month. One manager telegraphed the discovery of phenomenally rich ore in one of the stopes of the mine, and supplemented it by writing a glowing letter about it. This mine was on a paying basis, but a few weeks later he was reminded of the rich find by receiving a letter from the head office, in which caustic comment was made on the fact that, notwithstauding the reported "rich strike," there had been no noticeable increase in the bullion outpnt. The strike had proved to be only a hatfnl of rich ore, and had no material influence on the monthly clean up. A judicious admixture of rich and low-grade ore is advisable, as it makes things run more smoothly, and this can only be done by taking careful daily samples of the ore faces being stoped. It is not suggested that rich ore be mixed with that too low grade to pay a profit, but to so select the low-grade and high-grade ores as to outpnt about the same amonnt mouthly. This gives stockholders confidence in their mining shares as an investment.

In the taking of daily samples the person taking them should carefully mark each sample with a tag bearing snch informatiou as will make it possible to return to the same place at any time later and secnre another sample in the immediate vicinity. This is of course impossible in a stope where all the ore is being removed, but applies more particularly to drifts, raises, winzes, shafts in ore, and development work in ore generally. It is no uncommon thing, in looking over an assay book in which have been recorded the samples taken in a drift, to find entries something like the following:



"421. Dec. 2nd—2 feet right side south drift 500 level, $7.40 gold, 2 oz. silver."

Six months later no one can find with any degree of certainty within 30 to 50 feet of the point representing the face of that particular drift on Dec. 2. A tag bearing the inscription: "No. 421. Dec. 2nd, '03—106 feet from main crosscut south drift 500 level, 2 feet right side of vein, $7.40 gold, 2 oz. silver," would make it possible to return to this place at any time thereafter, until the ore over the point where this sample was taken has been stoped. This spot can be found again by this means and other samples taken from the vicinity if desired.



This is merely snggestive, and indicates the necessity of making mine records in such a manner that they will not be of momentary use only. The taking of mine samples by the foreman shift boss, or the assayer, or by any other persou, should be carried on with as much care as though the mine were under rigid examination by expert engineers, and in a well regulated mine this is usually required. A sample, so called, which does not actually represent as nearly as possible the ore as it occurs in the face, or back, or wherever it may be taken, is worthless, and an extravagant waste of time and materials.

FOR the forty-fourth time the MINING AND SCIENTIFIC PRESS wishes its readers the world over a pleasant Christmas and a prosperous New Year.

MINING and scientific progress has been made manifest in many ways during 1903, and in the multitude of industrial upheavals and the strife which goes with all progress is mingled much that makes for advancement. The newspapers have been filled with the rights and wrongs of labor and the folly of labor leaders in the misuse of new-found power; daily, likewise, has been chronicled the mistakes and mishaps of organized capital, but these things can be left to the inevitable rule of the natural law of the business world, the eternal law of compensation. There always have been squabbles and for some generations yet they will continue; the civilizing effect of science has a tremendous influence upon every form of industry, and as the years come it is being more generally realized that scientific methods of work in the mine, the mill, the workshop and elsewhere will stand pre-eminent. Time was when political and financial problems demanded the world's attention for their solution. It is now being recognized that scientific progress is more important than any other one thing. It was the cyanide process that made the South African war. A notable improvement in smelting methods; a more economical way of gold extraction; a popularization of the idea embodied in wireless telegraphy; a radical improvement in the design of a locomotive boiler; the development of light without heat; a marked diminution in the cost of long-distance electrical transmission; any one of these would be of more far-reaching result than warriors or legislators could devise. Science leads: the world waits on scientific progress, and in a few generations technical schools will be as munificently endowed by public appropriations as are now armies and navies. Time was when trade followed the flag; now it follows brains, and according as people generally discover that scientific progress pays greater dividends than any other form of human activity, all that goes to aid thereby will be advanced. The engineer is the biggest man of the twentieth century and will grow gigantic.

Mining Outlook for 1904.

With the close of the year 1903 the mining industry in the United States may be said to be in a prosperous condition, though the trials of the past year have been numerous and severe in some districts. This has mostly been due to labor disturbances. These have been confined to no one State or region. Colorado, Arizona, California, Nevada, Montana and Utah have been the States chiefly affected. Miners' unions have had usually a peaceful and prosperous existence in the mining regions of the West for many years, and it is only within the past three or four years that they have shown a disposition to depart from methods in securing their desires which would meet with the moral support of the people generally. About four years ago the miners of the Cœur d'Alene district, Idaho, in an effort to gain their point, destroyed the Bunker Hill and Sullivan mill at Wardner. Since then this sort of thing has become to be recognized as a weapon of the lawless element, to be employed when other means fail. That arson and murder are not approved by the people of the Western mining States as a method to securing desired ends is shown by the fact that in several States it has been necessary to call out the militia to protect property.

That the better class of union miners also disapprove of such measures is evidenced by recent events. In Cripple Creek district, Colorado, the mine managers have shown their ability to secure all the men they require, who are not members of the Western Federation, or who have left it, when the proper protection is afforded the men who are peacefully disposed, and only desire an opportunity to earn an honest living at their chosen calling. In southeastern Arizona a similar result is reported in the copper regions, and in Utah the militia is protecting the property of the coal companies and the lives of men desiring to work, and it is not unlikely the result there will be the same as it has been at Cripple Creek. It is true that the trouble at Cripple Creek and Telluride, as well as in the Colorado and Utah coal mines, is still unsettled, and in Yavapai county, Ariz., trouble continually in progress the last six months, is still unsettled, but the outlook for the future is not unpromising. In California there have been several strikes in various districts. In the southern part of the State, and in southern Nevada, the miners gained nothing; in Amador and Calaveras counties the miners gained their demands made last fall, but a new difficulty, which promises complications, has recently occurred in Calaveras county. Aside from these several districts scattered throughout the country, the industry has gone on prosperously, with a hopeful outlook for the coming year.

It is evident that the better class of miners, those who have houses and property of their own—the result of their industry and frugality—do not care to jeopardize their homes for the sake of uncertain gain, and a season of idleness with the possible excitement of a "brush" with the militia. In a number of instances it is known that prospective strikes have been averted by the clear-sightedness of this better element of the organized miners in districts where they have worked peacefully and contentedly for years, and where there was no thought of strike or trouble of any kind until the arrival in their midst of the professional agitator. The influence of these wiser heads is spreading, and the outlook for 1904 in the mining industry is more promising than it has been for several months past.

SOME time since the general land office suspended all entries of lieu lands. It is now stated that this order has been revoked and entries are again possible. The publicity given to the wholesale appropriation by syndicates of valuable lands on which is growing forests of timber, and some of which land is said to be valuable for mineral as well as for timber, resulted in temporarily withdrawing these lands from entry, but the embargo has now been removed, which suggests that the officials of the land department at Washington have made inquiry and that they now feel competent to judiciously handle the proposition. The whole matter seems a fit subject for congressional investigation, and possibly a change in the land laws if that be found advisable.

Government Aid to Mining.

The necessity for larger schemes than are possible to small mines or individual miners has been recognized in such cases as the retention of debris and the furnishing of sufficient water, etc. A gigantic plan embracing the latter is in operation under governmental control after having been constructed by Government funds in Western Australia, where what is considered the biggest pumping scheme in the world is affording the miners in that region relief from a former water famine. The system now in operation is capable of pumping 5,000,000 gallons water daily a distance of 387 miles from a reservoir at Helena to the terminal reservoir at Bula Buling. This involves carrying the water through 30-inch pipes a distance of 380 miles, there being twenty relay pumping stations, in which are operated sixty-five separate pumping engines. This supplies the Kalgoorlie and Coolgardie region, and while it was long recognized that the richness of many great gold mining properties there justified such action as has been taken, the enormous attendant expense deterred private capital from undertaking so huge a scheme. The entire first cost—over $14,000,000—has been borne by the Government, which also assumes the annual expense entailed by the work of pumping and keeping up the plant, which necessitates heavy charges for the use of the water made so precious at such a distance from the source of supply. Reckoning on a daily use by miners and others of 2,500,000 gallons, it is calculated that the interest, sinking fund, maintenance and working expenses will aggregate about $1,500,000 per year, and to meet this there is a charge to the consumer of $1.50 per 1000 gallons. This is a heavy tax on the mining industry, but is cheerfully met, for even at that rate it is found profitable to operate properties that otherwise must remain idle. The possibility of securing the necessary water is also aiding in the further development of the district, and it is now figured that when the demand is up to the capacity of supply the cost per 1000 gallons can be reduced to $1. The possibility of irrigation and thus lessening the cost of food supplies is also reported promising. The scheme has met much opposition and considerable criticism, but while it is true that as a general proposition the paternal idea of government is not to be unduly encouraged, yet, in such cases as that cited, where the cost is too much for any one mining company, and it is not feasible to combine in mutual enterprise for common profit, Government must take hold of the project or a vast region be allowed to go undeveloped. The progress of the work has been described herein, and from its inception to its present practical operation it is interesting from an engineering standpoint.

THE Idaho State Mining Association has been organized, with headquarters at Boise. It starts off with a membership of over sixty men, nearly all of whom are mine owners and operators, mining engineers, etc. The purposes for which the Association has been organized are to aid in the development of the mineral resources of that State; to assist in promoting the progress of technical and practical knowledge of mining in the State of Idaho; and to secure judicious mining legislation. Only those actively or financially interested in mining in that State are eligible to active membership and office. The management of the affairs of the Association is in an executive committee. This Association has been organized along lines similar to the State Associations of other mining States, having in the main similar objects. Rightly run, these associations can be of advantage to the industry and promote its best interests.

THE "mining directories" and "lists of mining companies" so sedulously advertised are in the main of no essential value some time after compilation. Repeated expensive trials have shown the futility of any attempt to prepare a permanent record of that kind that is of much value. The subscription lists of a live journal devoted to the interests it represents are of infinitely more value to the progressive advertiser than any "directory" or "list" necessarily can be, for no matter how carefully the latter are prepared they soon lose whatever little value they at first possessed.

Science in Prospecting.

That many valuable mines have been discovered by the class of men known among experienced miners as "tenderfeet" cannot be gainsaid, but many more have been found by men who are known as "prospectors," men who form a distinct class in the great army of miners. The prospector is seldom satisfied to work for wages, preferring to take his chances in the unequal battle with nature. His calling is distinctly an art—a science. A man may be a scholar and student of many sciences, but unless he has had the training "in the field," as a prospector he is likely to prove a dismal failure. The prospector is usually optimistic, as he must needs be, for his disappointments outnumber the realizations of his hopes. The man who is not of sanguine temperament will probably soon give up the task of wooing fortune among the rocky hills, in a wilderness. The real prospector, however, lives in the future. If disappointed to-day he lies down in his blankets at night hoping for and expecting success to-morrow. His eye scans every rock, every mineral stain. He is on the lookout constantly for "indications." These include everything that his long study of his art has taught him to regard as a favorable possibility. A prospector panning gravel in a new gulch was asked "any gold?" "No," was the cheery reply, "but plenty of iron rock and rubies." This to him was an indication of the probability of finding gold in that gulch and perhaps in the next panful of dirt. The reason for this was that the gold accompanied other minerals of high specific gravity. The prospector did not reason it out along this line, but his experience had taught him that when he did find gold in that section "iron rock and rubies" (garnets) were also always present. By many experiences of this sort he learns his craft, and he is not to be turned easily aside in his belief, for he has the "courage of his convictions" and is willing to follow them to disaster if may be, figuratively speaking, for nothing but absolute failure will convince him he was wrong, and even then he has a "notion" to try it again. In his quest he finds a piece of float. He will systematically trace it to its source if the richness of the rock warrants it. He will dig test pits by the dozen, and some hillsides have been "coyoted" into a labyrinth of passages in the search for a rich vein, the float of which has been discovered below on the hillside. Too often his knowledge of geology is limited to the field of his own experience and he misinterprets what he sees, but on the practical side he is all right, and will follow his "indications" unerringly to a conclusion of some sort. If the find proves too small or too low grade or is in any way unsuited to his fancy he moves to another place, pursuing his calling untiringly and often successfully. The mining industry owes much to the prospector, and he has been a factor in the development of the great West, which few who do not know him, and who are unfamiliar with what he has done for the world, can realize.

THE creation of power, the supply of working energy, on the North American continent, has been an increasing industrial feature of 1903. Most prominent are the daily 500,000 H. P. being developed at Niagara Falls, N. Y., at a stated cost of $25 per horse power per year, and the extension of electrical power in California and Mexico. In California wheels are now driven by electric power transmitted from the creative dynamos 240 miles distant, this being but an indication of the potential possibilities of the future. The economy of such electric power, East or West, as compared with coal, is too manifest to need extended note, though the extremely low figure cited in New York State, and the fact that California has demonstrated that a central source of electric supply can cover with commercial success a circle of nearly 500 miles diameter, is tremendously suggestive.

THE opinion of expert geologists has come to be recognized as of great value among mining men, and large investments are sometimes made on their statements relative to the economic possibilities of certain districts. In view of this fact the mining geologist shoulders a grave responsibility when he ventures an opinion as to the value or worthlessness of any particular stratum or kind of rock in a mining district, and he should have the best of reasons upon which to found such statement.

Result of Optimism.

A mine cannot be considered developed when it simply has one tunnel or a single shaft in the vein or ore body. Not infrequently mines are equipped with a large and expensive milling or reduction plant long before development has proceeded to a point which will keep the mills or smelters supplied with ore and, too often where this is done, the subsequent development fails to find enough ore to keep a much smaller plant in operation than that provided. This is not the experience of the early mining days alone, but it is a condition too often observed now when there is less excuse for such optimistic estimates of ore reserves prior to development of the property. A case in point would seem to be that of the Majestic Copper Co., near Milford, Beaver county, Utah, where an extensive reduction plant has recently been completed. Now it is announced that the works are closed down pending the further development of the mine, with a view to ascertaining whether there is ore sufficient to keep the works in operation. This is not an isolated case; there are others of like condition.

An instance is afforded in a case wherein what is known as the "smelter trust" at Santa Barbara, Mexico, the combine is credited with having built a 450-ton plant, divided into three units, when they did not have water enough to run more than one unit more than two-thirds of the time. Then they had a chance to buy a water right close by with sufficient water in it to run things, but, while negotiations were going on, President Towne, of the Montezuma Lead Co., adjoining them, got in and bought the property for its valuable water right. Did space permit, other instances might be cited, not in an invidious or carping way, but to illustrate that while anyone and everyone is liable to make a mistake, and be oversanguine or too hasty, yet the tendency of the times in these days of mining and scientific progress should cause adequate surface appliances to follow and not precede the other manifest requirements of the enterprise.

IT is little use to write to a mining journal for opinion of a certain mining investment after the questioner has made the investment, expecting indorsement and approval while asking for information. Where doubt or disbelief exists it were better to find out the truth before the purchase. In a general way, it is always well to use the same caution and prudence that one should exercise in any purchase of anything. Mining is a business, just like any other business, and a most profitable one, rightly run; there is risk and chance, as in all lines, no more, no less, and an investor should use the same degree of business judgment in a proposed mining investment that he would in any other proposition where he considers the investment of money with expectation of profit. To do this he naturally wants to know something about the locality, the kind of proposition it is, freights, development work, kind and degree, mining and milling facilities, wages and twenty other items. Most of all, he needs to be reasonably sure of the men with whom he deals, and not be too credulous as to assurances and promises. Usually the truth is good enough and the facts need no exaggeration, but it sometimes happens that a man with a mine to sell has said so many extra good things about it that he finally gets to believe them himself. But the time to find out about such mistaken assertions is before, and not after, the purchase of an interest therein. It is well to bear in mind that all the "greed" is not on the side of the seller. It is the ignorant greed of the buyer that occasions opportunity for nine-tenths of the fraud possible in mine stock transactions. No one can expect to get something for nothing, and, whoever does, cannot justly complain on being disappointed.

THE building of the Panama canal is interesting from many standpoints. Now that Panama is an independent government, and the United States is about to push this long-deferred work, after the financiering of the $200,000,000 that first and last will be required, comes the engineering and furnishing of machinery and appliances. The supplying of the mechanical devices will, of course, be an American matter, and already prominent machinery manufacturers are doing some preliminary work in that regard. The building of the Chicago drainage canal showed how economical and efficient labor-saving devices could be utilized in such work. The steam shovel; the cantilever crane; dynamite; railway material of all kinds, electric and steam; air compressors; pneumatic tools; drills; cable-ways; wire rope tramways; belt conveyors; are among the more prominent and immediate requirements connected with that great enterprise.

THE fact that a stock company organizes to develop a mining property and advertises its stock is sometimes unfairly considered as in some way reflecting on the solvency of the scheme or the merit of the enterprise. "If," say objectors, "the property is so good a thing why do you want to sell stock? Why not keep it all yourselves?" But this matter of mining stock corporation is just the same as in any other case where money is required to do that which no one can compass singly. So railways are built, so great enterprises are permitted to be of public benefit and private gain. As well inveigh against the creation of a line of steamships started through corporate effort, or a great manufacturing establishment, founded by co-operative capital, which is what all solvent corporations are. Many a deserving mining property — itself the nucleus of a profitable town—remains unproductive and undeveloped because its owner has but a thousand dollars. Were 100 men to contribute that amount there would be enough to make the mine; for mines are made, as are railroads, steamships, manufacturing establishments, and in the same way, by aggregation of small capital. The Pennsylvania railroad will spend $60,000,000 next year on betterments; this because it is owned by 3724 different men and women. No one of these 3724 could do what that road finds necessary to do to develop its property to its utmost earning capacity, but jointly they can tunnel New York bay, as in the same way the S. P. Co. will tunnel the Sierras. The day of little things is still with little people and that day will forever abide. But there are big things for big minds in mining, as well as in all other profitable ways of making good clean money, and one of these ways is the plan long since discovered of putting the many small sums together to make the required sum. And it should not be necessary for any honestly officered and good-intentioned mining company to make any apology for doing what every big thing in the business world requires should be done. Nor is such explanation or apology needed. Such explanation would be unnecessary to those who are capable of appreciating it and useless to those who are not.

AN attempt to have the Australian Parliament pass a law requiring mine managers in Western Australia to take out certificates, is opposed by the Chamber of Mines at Coolgardie, on the grounds that those with influence have experienced no difficulty in securing managers' certificates in other provinces where the law requires them, citing instances where men have been issued certificates as mine managers who have never been underground in their lives. There is much that is farcical in these managers' certificates. An instance is known where a mine manager of world-wide experience could not secure a certificate in New South Wales, Australia, because he had not had the management of a mine in that province for five years prior to the passage of a certain local law without submitting to an examination by a board of examiners, who pass upon his fitness for the position, no regard being paid to his experience and success gained elsewhere, while another man passes the examination technically with no practical experience whatever.

THE recent decision of the Supreme Court of California, to the effect that the owner of an artesian well is only entitled to the water that can be usefully employed on the land where the well is situated, has already commenced to bear fruit. A suit has been begun in San Bernardino county to enjoin a water company from pumping water from an artesian well. The plaintiff claims that at one time he had an abundant flow of water in his wells, but since defendant corporation began pumping the wells on their lands plaintiff's wells have ceased flowing. Other suits of similar character are in contemplation by other parties.

CONCENTRATES.

THE essential in the argument is not to prove that you are right, but to prove that which is right.

UNDER an absolute pressure of 125 pounds per square inch, regardless of friction, 45,441 pounds of steam would flow through a 3-inch pipe in one hour.

WHERE a weight of twenty-five pounds is let drop 6 feet on the head of a spike, driving it ¾ of an inch into a plank, the force of the blow in pounds is 2400.

A CUBIC FOOT of air at 60° F., barometer at 30 inches, weighs .0765 pound; twelve pounds of air equal 156 cubic feet; air expands $\frac{1}{491}$ of its bulk for every degree of heat added.

THE 2½-inch pipe being 32 feet long, there being one elbow, the pressure being 90 pounds per square inch, there would flow therethrough 715 gallons of water per minute.

IF a vertical pipe 6 inches in diameter and 600 feet long be filled with petroleum, a pressure of 228.63 pounds at the bottom of the pipe will cause the oil to overflow at the top.

RUSSIA produces quicksilver. So far as known, the only productive quicksilver mines last year were those owned by Auerbach & Co., and which yielded what was equivalent to 11,974 flasks.

THROUGH a 3-inch vertical pipe from the bottom of a tank 4 feet 10 inches in height and 6 feet diameter, total head 18 feet, there would flow 3751 pounds of water per minute, developing about 1 H. P.

THE use of kerosene in steam boilers is not recommended. Whatever its action upon boiler scale is considered due to inductive action on the iron, which it induces to unite with oxygen, forming iron oxide.

ANTIMONIAL or hard lead contains from 17% to 27% antimony. There is very little antimony produced at present in the United States, largely because there is no duty on that metal, and the existence of low freight rates, foreign.

THE tank containing 6000 pounds water, at a temperature of 60° F., and to be heated to a temperature of 212° F., would require 910 pounds of steam discharging directly into the water, at a pressure of 100 pounds per square inch.

ROUGHLY ESTIMATED, the depth of the shaft according to barometric reading would be about 1800 feet, as atmospheric pressure increases with shaft depth about 1 inch rise in the barometer for every 900 feet deeper from the surface.

A FLUX that might be used to advantage in treating the calcined slimes in graphite crucibles would consist of: Powdered borax, five parts; soda bicarbonate, two and one-half parts; sand, one part—one part of this flux to be used to two parts of the gold slimes.

THE Secretary of the Interior has more than once affirmed the principle that surface indications of petroleum do not conclusively prove, within the contemplation of the law, that the land carrying them is petroleum bearing, and therefore entitled to classification as mineral.

AT the Chapin iron mine, Michigan, 2000 H. P. is developed by the Quinessec falls. This power is applied to air compressing machinery, and power is transmitted about 3½ miles to the mines through a 24-inch main, where it is distributed by laterals to the shafts and works.

NICKEL STEEL is now made containing 36% nickel. This alloy admits of almost no appreciable expansion, and temperature has little effect upon it, making it extremely valuable for chronometric apparatus and other instruments in which the maximum of accuracy is essential.

THE largest gas engine in operation is one built at Seraing, Belgium, a 1200 H. P. tandem gas blowing engine. The gas cylinders are 51 inches diameter; the blowing cylinder is 73 inches diameter; stroke 55 inches; speed 80 revolutions per minute; weight of flywheel 33 tons; total weight 237 tons.

THE minerals of the soda group are not of common occurrence. They are gallalite, hauynite, noselite and lazurite. In composition these minerals are like garnet which they also resemble in crystalline form. They occur with volcanic and intrusive rocks, and are usually present in phonolite, and rocks of that character.

GUN METAL is no longer used for ordnance, but the alloy is in common use for general art work. Brass castings usually contain more or less scrap brass—that is generally made up of copper 70%, lead 4%, tin 4%, scrap, 18%. The lead gives it a good color, makes it easy to machine and greatly reduces the cost.

WHEN the crank is on either dead center all the space between the piston and the steam valve is called the cylinder clearance, and the space only between the piston and the cylinder head is called the piston clearance. Cylinder clearance must be taken into account when figuring out the mean effective pressure.

A PUMP may be driven by compressed air as well as by steam. Special precautions are necessary to prevent the exhaust from clogging by collection of ice, due to rapid expansion of the air. This is accomplished by having an exhaust of large area or by allowing a stream of water to fall upon the pipe near the end of the exhaust.

THE lake described as being in the solid granite in upper Clear Creek county, Colo., is probably of glacial origin. Such lakes are not uncommon in high altitudes. Glacial lakes are of several types. Some are basins scooped out of solid rock, others have formed in valleys where a terminal moraine has caused a dam to be thrown across the valley.

A ROCK STRATUM may maintain its size and character over a large area, but usually there is more or less change in both character of the rock and its thickness in a distance of several miles. Thus a stratum of hard, firm quartzite at one locality may become either thicker or thinner several miles distant and may be there an unaltered sandstone.

THE symbols used to denote cyanide of potassium are KCN or KCy. The first letter indicates potassium, for which the Greek word is kalium. CN is a compound radical of two elements, carbon and nitrogen, but is often written "Cy" for convenience. HCN, or HCy, is hydrocyanic or prussic acid, also called hydric-cyanide. It is a very poisonous gas.

THE mica from Hawthorne, Nev., is muscovite. Owing to surface decomposition it is not a merchantable article, but it may improve in quality with depth. Sheets 2x2 inches and even smaller are valuable if of good quality. The smaller sheets are used in electrical work. Mica is found throughout the regions of granitic rocks, but there are few mines which can be worked at a profit.

THE Idaho specimen contains alumina, as could any "specimen" picked at random from any clay bank, but not in sufficient quantity to render its extraction profitable or (commercially) possible. The chief source of American aluminum is bauxite; its chief user, the Pittsburg Reduction Co. About 20,000 tons were produced in the United States this year, and about an equal amount imported.

WASTE broken in the lowest levels of a mine during development may be utilized for filling in stopes on higher levels by providing a rock bin at the shaft, at a point above the station where it is desired to draw the rock into cars for delivery to stopes on the levels below. In the case of inclined shaft the rock bin may be cut in the foot wall side of the shaft, and a gangway cut underneath it for the passage of cars.

THE atmospheric pressure at sea level under ordinary conditions is 14.72 pounds per square inch. At 5000 feet altitude it is 12.27 pounds; at 10,000 feet altitude it has decreased to 10.26 pounds, and at 16,000 feet it is 7.98 pounds, or only a little over one-half of the normal pressure at sea level. Air compressors are affected by this change in pressure of free air. At an elevation of 15,000 feet, a compressor only develops about 57% of that at sea level.

AERIAL wire rope "tramways" should prove as commercially profitable in Chile, Peru and Bolivia as they have in other mountainous countries. In the countries mentioned experience has shown that the cost of transport in francs per ton is 0.06 with canals; 0.10 with steam railways; 0.11 with electric railways; .012 to 0.10 with aerial ropeways; .035 with level roads; .06 on roads with steep grades; .09 on mules; 1 on horses, and 10 by human power.

REGARDING the approximate pressure of two columns of water, 6 inches and 8 inches diameter and 50 feet high, it is to be noted that a column of water at 60° F., 1 inch square and 1 foot high, weighs .433 pound, and, consequently a column 50 feet high would weigh 21.65 pounds, which would be the pressure per square inch in either pipe. The total pressure would be as much greater in the 8-inch pipe as compared with that in the 6-inch pipe, as the area of an 8-inch circle is greater than the area of a 6-inch circle.

THE distribution of tellurides containing gold is now known to be world wide. The most noted districts now producing this class of gold ores are the Cripple Creek region of Colorado, the telluride districts of the Black Hills of South Dakota, and the mines of Western Australia. In more limited amount they occur in California gold mines, in New Zealand (north island), South Africa, in Transylvania, numerous districts of Colorado, in Chile, in Hungary, Sweden, Germany, India, and several other Asiatic countries.

WHILE it must be conceded that there is such a thing as secondary enrichment in the distribution and deposition of ores, yet it is not clear that the existence of a barren zone in a mine can be used as constant argument that such strata or formations have by leaching occasioned a deeper zone of paying ore, made paying by secondary enrichment. The argument and deduction is ingenious, but not convincing nor conclusive. At best, it is but a hypothesis, and, however plausible, might cause loss to its many believers.

PORTLAND CEMENT WORK which is to be painted should be thoroughly hardened and dry. It is advisable to let the work stand for a year before oil paints are applied. The durability of the paint will be assured by first brushing over the surface with dilute sulphuric acid—one part of acid to 100 parts of water—and allowed to dry before painting. A preparatory coating for oil paint is a solution of common water glass in three or four parts of water. Two applications of this, followed by a washing with water, and then another application of water glass, will be found effective.

BARIUM CHLORIDE is the barium compound most commonly employed in the laboratory, and may be formed by dissolving the carbonato of barium in diluted hydro-chloric acid, and evaporating the solution. On cooling the chloride is deposited in tabular crystals. On a commercial scale it is usually made by fusing heavy spar (barium sulphate) with calcium chloride, in a reverberatory furnace. The mass is rapidly extracted with hot water which leaves the calcium sulphate undissolved, the clear solution of barium chloride being decanted and evaporated to dryness.

WOLFRAMITE, hubnerite and scheelite contain sufficient tungstic acid to be commercially profitable as tungsten ores. Scheelite is reported in considerable quantity 14 miles from Calionte, Kern county, Cal.—a tungstate of calcium carrying 79% tungstic acid. Tungsten is chiefly used in the manufacture of tungsten steel. One method of reducing the ore to tungsten oxide is by fusion with soda, leaching out the soluble tungstate of soda and adding an acid, which precipitates the oxides subsequently separated by filter presses. The supply is limited, but is commensurate with the demand.

REGARDING relative tonnage and width of furnace in copper matte blast operations, the quality of the ore would necessarily be an important factor in determining the economical working. An extremely narrow furnace would be 35 inches wide at the tuyeres; an extremely wide one, 56 inches. A furnace 35x122 inches at the tuyeres would have 29.68 square feet hearth area. A 44x100 inch furnace would have 30.5 square feet hearth area at the tuyeres, and would give about seven tons smelted per square foot of hearth, averaging 215 tons per twenty-four hours. This size would require nineteen ounces blast; a 56-inch furnace twenty-seven ounces blast pressure.

IN the erection of electrical generators, small belted machines up to 10 or 15 K. W. are often set on the floor when it is solid, with no further foundation. For larger machines a foundation should be furnished of brick laid in cement, or better still, of solid concrete, with a cement and sand cap, or surfacing. The depth ranges from 2 to 5 feet for small and moderate sizes, varying with the character of soil, as well as size of machine. Foundations are usually battered, especially in the direction of belt pull. For generators requiring a foundation, it is usual for the manufacturer to furnish the purchaser an outline and foundation blue print, giving necessary information for installation.

IN the case of Wisbon vs. Great Western M. Co. (69 Pac. Rep., 1106), the Supreme Court of the State of Washington held that one who examines a mine and makes a report on same for an owner, under a contract that he shall receive a certain amount therefor if a sale be effected "by and through" the report, can not recover on evidence showing that merely one to whom such report was furnished, with other reports of a similar nature, became the purchaser. In the case stated in the inquiry, it would seem that the testimony of the purchaser, if procurable, would go far toward establishing the fact of the special report in question having favorably influenced the sale.

AT 60 pounds pressure 1 cubic foot of air corresponds to 5.10 cubic feet free air; at 80 pounds pressure to 6.46 cubic feet; at 100 pounds, 7.82. An air compressor at 3000 feet altitude would require 272 H. P., to supply air for twenty-five 2½-inch rock drills in rock of ordinary hardness, the drills 2000 feet from the air compressor. It would require a duplex air compressor with 18-inch steam cylinders; 20-inch air cylinders; 24-inch stroke, 175 strokes per minute. An air drill is assumed to be supplied with air at pressures between 60 and 100 pounds per square inch. The best service is secured when the compressor is working against the pressure for which it was designed by its builders.

PNEUMATIC HAMMERS may be divided into two classes—valve hammers and valveless. In the latter the piston is the hammer and in its movement opens or shuts the inlet or exhaust ports. Valve hammers have a distinct and separately moving valve. The valveless is a short-stroke machine, best fitted for calking and chipping with a possible piston speed of from 10,000 to 15,000 strokes per minute. Valve hammers are well adapted for riveting; the travel of the piston or hammer being longer, the machine works at 1500 or 2000 blows per minute. The blow is heavier than that of the valveless

hammer. The weight of either variety of these pneumatic hammers runs from 3 to 25 pounds.

✤✤✤✤

While Section 2324, Revised Statutes of the United States, requires that in marking a mining claim the location must be distinctly marked on the ground so that its boundaries can be readily traced, the law does not require that the boundary lines shall be indicated by physical marks nor monuments, nor does it define what kind of marks shall be made, nor on just what part of the ground claimed. Any marking, whether by stakes, mouuments, mounds, written notices—anything that will enable the boundaries to be readily traced—is legally sufficient. The above refers to the boundary lines, but the corners and end centers must be distinctly marked by monuments, mounds or posts as required by law.

✤✤✤✤

Telluride ores are not amenable to amalgamation, or to the usual methods of concentration, and in treatment by fire processes there are usually heavy losses by volatilization. Assays on telluride ores are not always reliable, and experiments have demonstrated that results vary considerably on the same sample; for this reason special methods are employed in assaying telluride ores. Some assayers prefer the scorification assay for this class of ores. The quantity taken for this assay depends upon the richness of the ore and the size of the scorifiers. Generally $\frac{1}{10}$ or $\frac{1}{20}$ assay ton is taken. For telluride ores $\frac{1}{10}$ assay ton is taken, with 50 grammes of test lead and 0.3 gramme of borax glass. Add a cover of litharge and rescorify the button.

✤✤✤✤

Hornblende and amphibole are nearly synonymous, the chief difference being that amphibole covers the non-aluminous varieties, including tremolite, actinolite and asbestos. Hornblende embraces the aluminous varieties, including glucophane, a blue hornblende. Tremolite is calcium-magnesium amphibole, white to dark gray in color; actinolite is calcium-magnesium-iron amphibole, color green and grayish green. The cleavage angle of hornblende is 124°. That of pyroxene which chemically resembles hornblende, is 87°. The pyroxenes are divided into aluminous and non-aluminous varieties. Augite belongs to the alumiuous section together with enstatite and bronzite. These are the more common varieties, the non-aluminous species being comparatively rare.

✤✤✤✤

Calaverite is not affected by concentrated hydrochloric acid, but on heating up to strong fuming with concentrated sulphuric acid, the tellurium goes into solution, coloring the acid crimson and leaving a residue of fine gold. It is decomposed by concentrated nitric acid with the separation of spongy metallic gold, and dissolves in aqua regia, leaving a slight residue of silver chloride. Like other tellurides, calaverite occurs in irregular masses, strings and veins in greenstone schists and other foliated rocks in the veins of quartz, calcite and other carbonates traversing them. In the transition zone it is often found to be covered on exposed faces by a thin layer of mustard gold, while in the oxidized zone all the tellurium has been removed, leaving free gold only.

✤✤✤✤

By the "20-league zone" in Mexico is meant a strip of land along the international boundary between the United States and Mexico, which has a uniform width of 20 leagues—about 52 American miles. No foreigner can denounce (take up) mining claims within that zone without special permit. When a foreigner has secured such permit, he must present the same within four months of the date of the certificate, in order that the docket relative to the concession sought may be closed. In endeavoring to obtain a concession to mine in Mexico, a rigid observance of all the laws relating to mining in that Republic is advisable. The more valuable the concession the greater the need for care in all matters pertaining to it. The same suggestion applies to taking of mining claims in the United States.

✤✤✤✤

If a suitable coil of wire which carries an electric current be suspended in such a manner that it is free to revolve, and a magnet be brought near to one side of it, the coil will either be attracted or repelled by it, depending upon which pole of the magnet is presented, and also in which direction through the coil the current of electricity is flowing. In a similar manner, if a magnet be suspended in such a manner as to be free to revolve within a coil of wire carrying a current of electricity, the magnet will revolve either one way or another. This is the principle upon which the electric dynamo and motor is constructed and operated. The current produces motion, and motion will also produce current. The electricity thus produced is taken off by means of brushes and conducted by wires to wherever it is to be utilized.

✤✤✤✤

The fire assay of copper, as practiced in the Lake Superior region, is only adapted to the assay of ores containing copper free from sulphur. In those ores native copper is the only metal to be considered, though the presence of red or black oxide of copper is not detrimental to the process. In an assay charge of Lake Superior ore there is generally present native copper, upward of 50% titanic iron, silica, iron oxide, and metallic iron from the shoes and dies. As fluxes, bicarbonate of soda, borax, argol, iron oxide, sand and slag from previous assays are used. The mixed charge of ore and flux is fused for about twenty-five to thirty minutes in a wind furnace, the resulting button being nearly pure copper. The success of this method of assaying depends to a great extent upon the experience and skill of the operator.

✤✤✤✤

Metallic manganese is very little used in either arts or manufactures, is extremely difficult of reduction from its ores, and is only produced in very small quantity for test work in laboratories, etc. It is worth about $20 per pound. Manganese ores of high grade bring prices depending largely upon supply and demand, there being no fixed prices. In California the crude ore as it comes from the mine is worth in San Francisco about $10 per ton. It is ground and disposed of by dealers at about $20 per ton. The ore submitted is pyrolusite (manganese dioxide) and is apparently high grade and free from impurity to a great extent. It is useful as a flux in some smelting operations, also in the manufacture of steel. Manganese concentrates containing 45% to 50% of manganese may be sold to the Illinois Steel Co., Chicago, Ill., providing they can be produced cheap enough.

✤✤✤✤

The practice of breaking ore by hand by means of hammers, for the purpose of concentrating by hand sorting, is followed to a comparatively limited extent. Formerly it was a popular method at shipping mines. The impression prevails that Mexicans and Chinese make better ore sorters than men of other nations. The theory advanced to explain this is that an American loses too much time in mentally making a distinction between that which is first class, second class, third class ore, etc., while the Mexican and Chinaman work more mechanically, and while possibly not accomplishing more in the way of tonnage than the American, they are usually willing to work at a somewhat lower price, which makes their services comparatively desirable for this class of work. There is a saying among miners that "the more intelligent a man is the poorer ore sorter he is."

✤✤✤✤

At sixty pounds pressure, a 3-inch rock drill per minute would need at least 150 cubic feet of air. It is always well in such cases as specified by our inquirer to allow 25% in excess of the requirements. At eighty pounds gauge pressure at sea level a 5-inch drill would require 190 cubic feet free air per minute. In this regard it is to be noted that the efficiency of air compressor drill machinery diminishes rapidly with the altitude, as it is proportional to the atmospheric pressure. With the barometer at 30 inches at sea level, the barometric pressure would be in pounds 14.75 per square inch. Assuming the efficiency of the air compressor as 100 at sea level, conditions would be changed at an elevation of 8000 feet. There the barometer would indicate 22.11 inches, with a barometric pressure of 10.87 pounds per square inch, the volumetric efficiency of the compressor being thus but 76% of that at sea level—a loss of 24%.

✤✤✤✤

To determine the quantity of sulphur in coal, mix thoroughly one gram of finely powdered coal with one gram of calcined magnesia and one-half gram of dried sodium carbonate with a glass rod in a platinum crucible, which is placed in an inclined position on a clay pipe triangle. Apply heat gently with a Bunsen burner, so that only the lower half of the crucible shows a dull red heat, and stir the mixture with a heavy platinum wire, at intervals of five minutes, for an hour. Cool and mix thoroughly one gram ammonium nitrate with charge in the crucible, cover, and heat for ten minutes. Remove mass to a beaker as completely as it can be removed from crucible. Add water to crucible, warm and remove the remainder of charge. If necessary, repeat operation until crucible is clean. Filter the liquids resulting from this process, heat and add barium chloride to solution to precipitate sulphuric acid as barium sulphate. Filter wash filtrate and dry. Heat to ignition and weigh as barium sulphate, deducting the sulphur content from original charge of coal.

✤✤✤✤

What is known as the Delprat process is the one patented by G. D. Delprat, general manager of the Broken Hill Proprietary Co., Australia, for processes relative to the treatment of residue of ores. In the first process, the sulphide ores, including the products and waste from other metallurgical processes, are finely pulverized and divided. They are then immersed in a bath, and the sulphides rise to the top, and are skimmed off or otherwise removed. No special plant or machinery is necessary for the immersion process; the powdered ore being fed into an inclined launder, makes its way by gravity to an ordinary steam-jacketed pan or vessel, or else into one set above an ordinary furnace. The ore then drops slowly into the bath. The bath consists of a solution of salt cake in water, and of a specific gravity approximating to 1.410. The solution is kept hot, but preferably not allowed to boil. As an alternative the hot bath consists of a solution of sodium sulphate in water, to which is added free sulphuric acid, so that the resultant will approximate to 1.410. As the ore immerses itself in the heated bath, the sulphides disengage themselves from the gangue, rising to the top, whence they may flow away or be skimmed off. The second process consists in the ores being dropped into a heated bath of nitrate of sodium, nitrate of potassium, or nitrate of zinc, dissolved in water, to which is added dilute nitric acid, so that the result will have a specific gravity of 1.410. The sulphides here also rise to the top and then flow away, or are otherwise removed.

✤✤✤✤

The process of sulphide smelting as practiced in Hungary, as described by Eissler, is as follows: "In treating auriferous iron pyrite contained in a quartz matrix, a flux must be added to melt the quartz; a slag will then be formed and the sulphide of iron will unite with the greater portion of the gold present, forming a heavy regulus, which will settle to the bottom. The stratum of iron sulphide thus formed beneath the surface of the slag and scoriæ produced by the fusion of the earthy and siliceous gangue is technically called matte. If the matte containing the gold is now roasted or oxidized by heating it with free access of air, whereby it is deprived of a further portion of its sulphur, and the product be mixed with a fresh quantity of crude pyrites, and smelted again, a second matte will be obtained, which will contain the gold from the first and second charges of the auriferous ore. This process may be repeated any number of times, until the precious metal has been sufficiently concentrated in the substratum of iron sulphide to admit of its profitable extraction. The last matte, containing the whole of the gold which has accumulated from the successive charges, and brought, therefore, to any required richness, is roasted and fused with metallic lead, litharge, or with a mixture of galena and metallic iron. The gold is taken up by the molten lead from the surface of which the impoverished, undecomposed sulphide and oxides are skimmed off." By this process the gold is obtained in a more concentrated form than if it were smelted directly with lead at first.

✤✤✤✤

Pyritic smelting differs from ordinary smelting chiefly in the use of the sulphur in the pyrite and other sulphides present in the charge, as fuel, whereas, in the ordinary smelting methods, it is desirable to have most of the ore of the charge oxidized before it enters the furnace, and charcoal or coke are employed as fuel, with sometimes wood as auxiliary. Lead and copper smelting are similar in many respects, though in copper smelting, matte and not metallic copper is usually produced, but this depends to a great extent upon the character of the ore. In lead smelting the ores are reduced to metallic lead, which carries down any precious metals that may be present, and also the copper if any. Hot blast is used in each of these several kinds of smelting, though there appears to be a disagreement among smelters as to the degree of heat most beneficial to the process. It is claimed that experiments have shown that a very hot blast does not pay in proportion to the expense necessary to raise the heat to a high degree. In some instances the heat of the furnace itself is employed to heat the blast, but it is not generally the practice, special stoves for heating the air being employed for the purpose. It is generally the aim of the smelter to have the gases escaping from the top of the charge at a relatively low heat. The gases from copper furnaces are not inflammable, but those of iron furnaces are, and there the furnace heat is utilized in an economical manner. The idea of hot blast in copper smelting was borrowed from the practice of the iron furnaces, and it has been in use in Europe for many years. The idea of heating air of the blast by means of the hot slag from the copper furnaces is said to be more feasible than the employment of furnace gases for this purpose.

✤✤✤✤

During the year of which this is the closing issue a large number of direct questions have been answered in this page of "Concentrates," the questions themselves being necessarily omitted for want of space, and only the answers furnished; even then in as condensed a form as is consonant with clearness. These questions through the years embrace nearly everything of importance in engineering, mining, metallurgical and general industrial life, and thousands of readers the world over have expressed their satisfaction with the service, which has been a gratuitous one to all readers of this journal. While every reasonable effort is made to secure and furnish prompt and accurate answer to the questions submitted, yet "Concentrates" modestly disclaims the ability to answer all the questions that are daily received. To do that would be manifestly impossible; on the principle that "everybody is wiser than anybody" experts in their several lines have often had those questions submitted to them with request for needed answer, and with uniformly gratifying results. The idea of this page of "Concentrates" first occurred to the writer several years ago when as editor he received many inquiries on matters of practical every-day requirements with the so oft repeated admonition: "Don't publish my name or address; just give the answer," that it seemed strongly indicated that such a department would be a popular feature, and one of great practical value, which it has manifestly become. In further connection with this subject the idea in general has been that such a question as is often asked is precisely the same one that is in the mind or on the tongue of many another one beside, and in answering the inquiry it is not alone the inquirer that is answered, but a host of others who wanted just what that concentrated little paragraph contained. The correctness of this view has been attested on numerous occasions when readers a thousand miles away from the inquirer whose question was answered have written to the effect that that answer was the precise solution to a problem that had come up in their daily work in the mine or mill or smelter or machine shop or engineering practice. Thus the answering of these questions has been a pleasure and a privilege through the years, and as in all other departments of its useful work, it it will be the province and the purpose of this journal to continue in its more or less successful attempts to afford some little assistance in the solution of some of the problems that present themselves in the daily lives of its readers.

Kinks in Ropes.

Written for the MINING AND SCIENTIFIC PRESS by WM. H. KRITZER.

To properly splice a rope or to tie a knot that will not slip is a simple operation, and the writer does not claim anything necessarily new and original in the following article, his intention being to illustrate a simple method of splicing a four-strand manila rope and the manner of tieing some of the common knots and hitches that are used in every-day practice.

In manufacturing rope, the fibers are first spun into a yarn, this yarn being twisted in a direction called "right hand." A number of these yarns—depending on the size of the rope—are then put together and twisted in the opposite direction, or "left hand," into a strand. Three of these strands, for a three-strand, or four for a four-straud, rope are then twisted together, the twist being again in the "right hand" direction. It will be noticed that, when the strand is twisted, it untwists each of the threads, and when the three strands are twisted together into rope it untwists the strands, but again twists up the threads. It is this opposite twist that keeps the rope in its proper form. When force is applied to the end of a rope the tendency is for the rope to untwist and become longer. In untwisting the rope it twists the threads up, until the straiu of the untwisting strands just equals the strains of the threads being twisted tighter.

It is this fact that makes it necessary to take out the "turns" in a new rope—that is, untwist it before it is to be used.

There is the same difference in the strength of various qualities of manila rope as there is in other materials, so the rope should be selected to suit the use it is to be put to.

The amount of work that the rope will do varies greatly, depending not only on the quality of the fiber and the method of laying up the rope, but also on the kind of weather when the rope is used, the blocks or sheaves over which it is run, aud the strain in proportion to the strain put upon the rope. The principal wear comes in practice from defective or badly set sheaves, from excess of load and exposure to storms.

The principle of a knot is that no two parts, which should move in the same direction if the rope were to slip, should lie alongside of and touching each other; with this point kept in mind the reader should have no difficulty in tieing the knots illustrated with a little practice:

The successive operations for splicing a four-strand manila rope by the method illustrated are as follows:

1. Tie a piece of twiue, I and J, around the rope to be spliced about 6 feet from each end. Then unlay the strands of each end back to the twine.

2. Butt the ropes together and twist each corresponding pair of strands loosely, to keep them from being tangled, as shown in illustration (a).

3. The twine J is now cut, and the strand H uulaid and strand G carefully laid in its place for a distance of 4½ feet from the junction.

4. The strand F is next unlaid about 1½ foot, and strand E laid in its place.

5. The ends of the cores are now cut off so they just meet.

6. Unlay strand A 4½ feet, laying strand B iu its place.

7. Unlay strand C 1½ foot, laying in strand D.

8. Cut all the strands off to a length of about 20 inches, for convenience in manipulation. The rope now assumes the form shown in (b), with the meeting points of the strands 3 feet apart.

Each pair of strands is successively subjected to the followiug operations:

9. From the point of meeting of the strands H and G unlay each one three turus; split both the strand H and the strand G in halves, as far back as they are now unlaid, and the end of each half strand "whipped" with a small piece of twine.

10. The half of the strand G is now laid in three turns, and the half of H is also laid in three turns. The half strands now meet and are tied in a simple knot, K (Fig. e), making the rope at this point its original size.

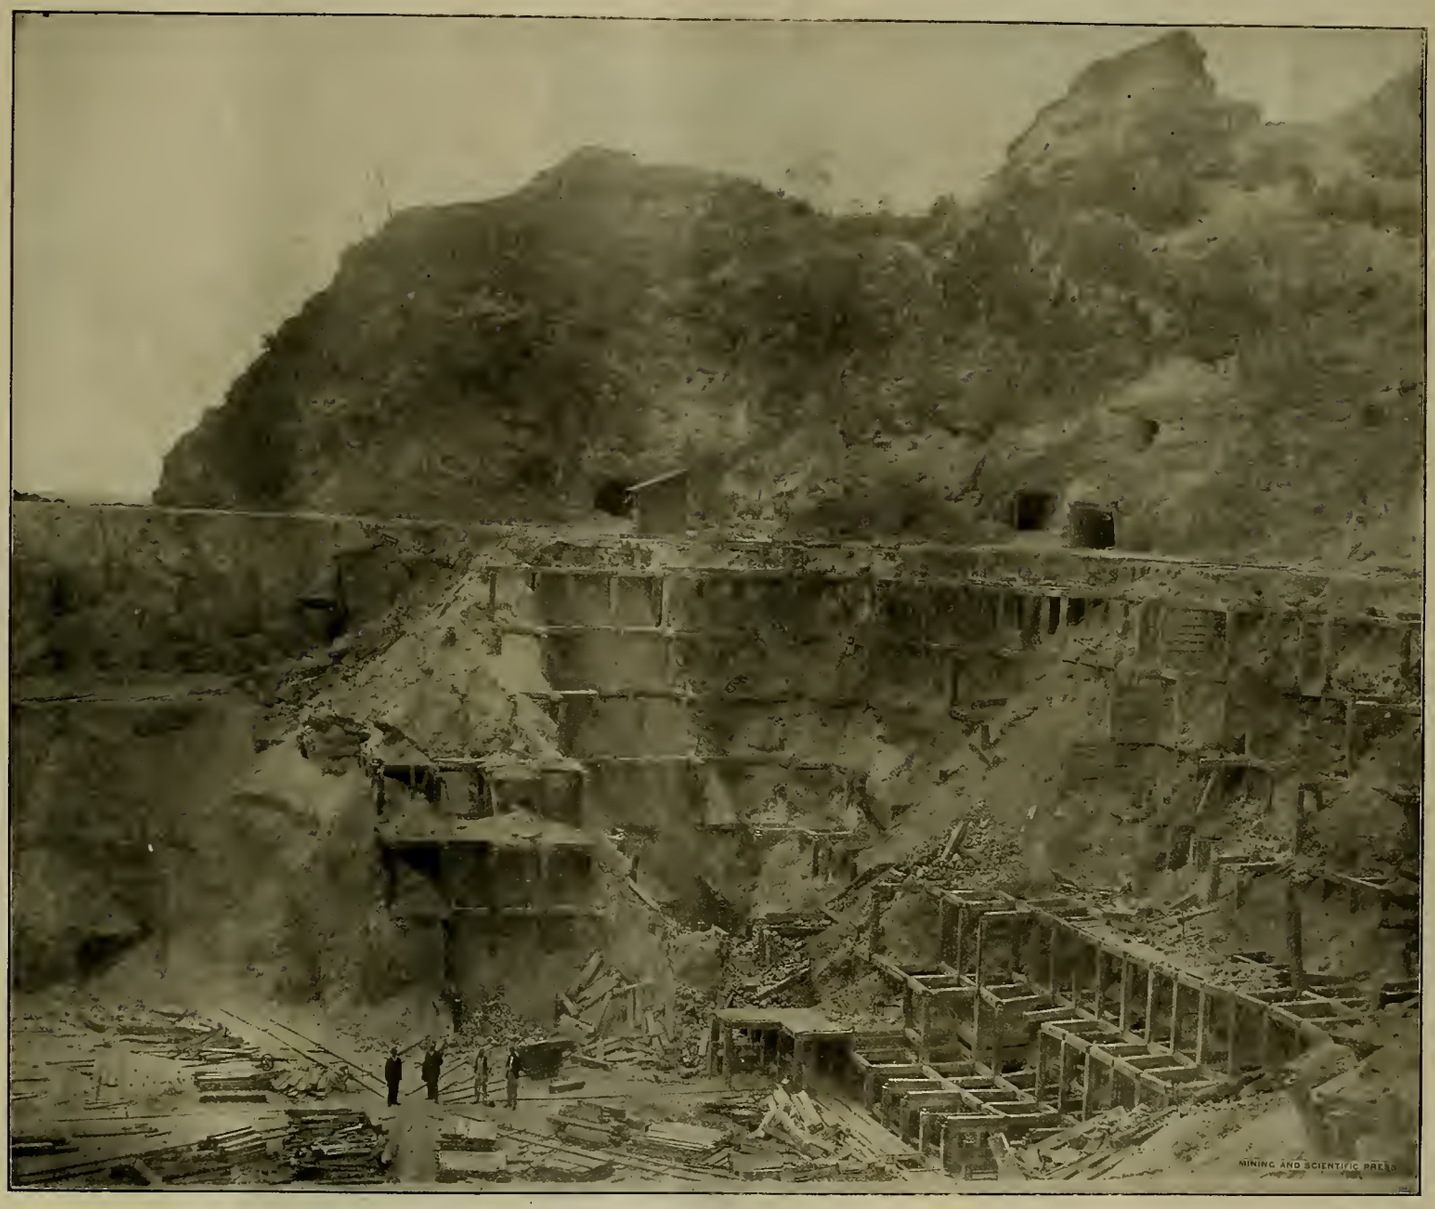
11. The rope is now opened with a marlin spike, and the half strand of G worked around the half strand of H by passing the end of the half strand G through the rope as shown, drawn taut, and again worked arouud this half strand uutil it reaches the half strand M that was not laid in. This half straud M is now split, and the half strand G drawu through the opening thus made, and then tucked under the two adjacent strands as shown in Fig. d.

12. The other half of the strand H is now wound around the other half of strand G in the same manner. After each pair of strands has been treated in this way the ends are cut off at L, leaving them about 4 inches long. After a few days they will draw into the body of the rope or wear off, so that the locality of the splice can scarcely be detected.

For a three-straud rope the foregoing method is slightly modified. After tying the twines I aud J around the rope about 6 feet from each end, unlay the strands back to the twine, bring the butts together, and twist the correspouding strands loosely together. Now cut twine J and underlay straud H for a distance of 4½ feet from the juuction, and lay in straud G. Unlay strand A 4½ feet, lay in strand B, aud cut all the strands off to a length of about 20 inches, as before explained for convenience in handling. This splice now assumes an appearance similar to Fig. b, with the exception that there are only three meeting points of the strands, and these are 4½ feet apart.

Each pair of strands is now subjected to the series of operations described for four-strand splice in steps 9 to 12 inclusive.

Note: Decrease the length of rope required for making splice as the diameter decreases, as above is for a 1¾-inch rope, and it would not be necessary to have this leugth of splice in a rope of smaller dimensions.



Owing to delay in the mails the report of the Patent Office at Washington failed to arrive in time at this office for the appearance herein of the usual notices of patents, and for the first time in eight years they have been unavoidably omitted.

Development and Operation of a Mine.

Written for the Mining and Scientific Press by W. H. Storms.

In the development of miues it should be the aim to so conduct mining operations that the most economic methods may be employed. In the early history of mining in the Western United States most of the veins mined were of comparatively small width, and were worked without unusual difficulties, in the manner common to that time, but here aud there were found veins so large as to render their working by the ordinary methods theu familiar extremely perilous, and, in some instances, impossible. This was chiefly due to the inability to securely support the walls of the excavations. Timbering with stulls of ordinary length was impossible, aud filling had not yet been resorted to, except incidentally, to get rid of waste. In some instauces timbers were spliced with a view to make stulls of sufficient length to reach from wall to wall. These, in some cases, were supplemented by sprags, which resulted iu constructing in the large stopes a rude, but frail, framework resembling the "square set." The disastrous caves which inevitably followed this method of support, soon made spliced stulls unpopular, aud, in most instances, their use was discontinued.

Until the introduction of the square set system of timbering on the Comstock lode at Virginia City, Nev., it was impossible to safely work ore deposits of great width occurriug in any but massive rocks, which would stand well without support. Mines of this character were successfully opened in limestone, and in some massive eruptive rocks, but as a rule the large veins were not operated extensively. The development of the West, however, resulted in the discovery of a great many large veins. Some of these were too low in grade to admit of profitable exploitation iu the early days, but the Comstock proved a boon to miners everywhere, for the unprecedented richness of some of the bonanzas found in that famous lode made it possible to introduce novel methods, aud

Open Cut Mount Morgan Mine, Australia, Showing Square Sets in Old Underground Stopes.

experiments were constantly being tried. If one failed the mines could well afford it, and other schemes were resorted to. It was a great school of experience, and from the Comstock mines managers went throughout the world and introduced the methods which had proven successful there, and they were found applicable, usually with some modification, to mines elsewhere, until to-day no mine is too large to be successfully worked by some one of the many methods which have been devised since the days of the Comstock and the introduction of the square set

Steam Shovel in Cut Granby Copper Mine, Phœnix, B. C.

method of timbering. As originally placed in the Ophir mine by P. Deidesheimer, the square set was much more elaborate than that system is now. In the Ophir it was a complete and finished system, comprising posts, caps, ties and wall plates, with angle braces, set nearly normal to the wall. The great stope in the Ophir mine—400 feet high—was subsequently filled with waste from the surface. In these modern days the practice varies from that of the early '60s, in that lighter timbers are generally employed, the uicely fitted wall plates are dispeused with, and the angle braces arc rarely seen. In lieu of these extra members in the set, coutemporaneous filling is resorted to, with the result that great ore bodies can be cheaply, expeditiously, completely aud safely extracted. The method by which stoping is generally carried on is usually determined by the character of the walls and of the ore body itself.

In these days large veins are preferred to smaller ones, as the former, if containing sufficient value to be profitably exploited, insure a loug period of successful operation. The selectiou of the system of development must be iufluenced to a great degree by the dip of the vein, and to a still greater extent by the topography of the country aloug the course of the lode. In a flat country cheap surface work is generally precluded, but where the veiu outcrops along a hillside the matter is simplified, and benching or open cut work is not only permissible but advisable.

Benching is a common practice in some regions, but unless the ore deposit is very extensive, and of large superficial area, this method is inadvisable, owing to expense of equipment. Where very large masses occur in a flat country, as is the case in some of the Minnesota iron ranges, this is one of the principal methods by which the ore is mined, but to reduce cost to a minimum where gravity cannot be employed, steam shovels have been introduced to handle a large daily tonnage, and their success is unqualified uuder the existing couditions at those mines. In some of these mines there is an accumulation of surface debris (gravel, soil, trees, etc.) overlying the ore body, and this must first be removed by the shovels, railroad tracks being laid in the pits and kept close to the face. The method of stripping and mining is esseutially the same, and is illustrated in the engraviug on front page. The ore is raised by the shovel aud dumped iuto cars standing on the track.

As the work proceeds downward, the pits may eventually become too deep for successful applicatiou of this method of ore extraction, and then it becomes necessary to siuk a shaft to get beneath the ore, that mining may be continued as inexpeusively as possible. Wheu the shaft has been sunk to a proper depth, levels are laid out, with drifts, crosscuts, etc., and raises are put up at stated intervals, those on the first underground level are extended upward to the open cut. Mining may then proceed almost as cheaply as it did before with the use of steam shovels, and often at a lower cost if too much water is not encouutered. When the development of the mine has reached this stage the method of operating is known as the "mill-hole" system of mining. The illustration, (front page), shows the method of mining by this system. There are several mill-holes shown in the engraving, through which the ore broken in the cut passes downward to ore bins on the level below, from which it is drawn into cars from chutes, and trammed to the shaft, where it is dumped iuto ore pockets beneath the station, and from there is loaded into skips and hoisted to the surface. This is briefly the general method employed in the mill-hole system, as practiced at the iron mines of Minnesota, but the same or a similar system is adapted to veins having a steep dip, such as are fouud iu most of the precious metal and copper mines. These usually occur in a hilly or mouutainous country, and the surrounding conditions are generally very different. It is an interesting fact, however, that the successful application of the steam shovel to irou mining has led to the introduction of mechanical shovels at the Granby copper mines at Phœnix, B. C., where they are said to be doing excellent work. One of the accompanying illustrations is that of a shovel at work in an open cut in the Grauby mine. This company has announced its intention of trying the experiment of operating a mechanical shovel in an underground stope. There is nothing impossible in this, nor is it in any way radically different from the operation of such a shovel in a surfaee eut if the ground stands sufficiently well to admit of cutting large stopes without timbering, for a mechanical shovel requires considerable room for its successful operatiou, aud close timbering would restrict if not prohibit its use underground. It is merely one of the things which show the tendency toward reducing the cost of mining by substituting mechanical devices for manual labor.

In the early history of a mine very often the conditions are not fully understood, and the development is not well planned with a view to the economical future extension and bettermeut of the property. One of the favorite methods has been surface benching in large ore bodies, but benchiug always involves an expeuse for shoveling, which is avoided by the mill-hole system where the rock broken on the sides of the cut passes by gravity to the mill-holes, and thus to the chutes beneath. Several large mines have broken many thousands of tons of ore in terraced benches. Oue of these was the Mount Morgan mine, Queensland, Australia, where the mine was worked almost exclusively by this system in its early history. Another noted instance is the Mount Lyell copper mine in Tasmania, where, in 1900-02, about 1000 tons were mined daily, mostly by the terrace system. At that time there were a series of nine terraces or benches, the total height being about 266 feet. Of these benches, the first three consisted of overburden (debris), and the second and third were also in part overburden, the balance being ore. The total height from the lowest floor of the cut to the summit of the hill upon which the mine is situated, was 320 feet. The excavation was 630x800 feet, which dimensions convey some idea of the magnitude of mining operations at that property. This plan of mining has succeeded that of underground stoping, and in the progress of which the old levels are completely obliterated. The blasts at Mount Lyell are fired at noon and at 5 P. M., at which time from 200 to 300 shots are discharged.

At this mine it was estimated that not less than 3,000,000 tons of overburden were required to be removed. The expense of breaking and removing this vast amount of barreu rock in order to reach the ore underueath, is estimated at approximately $1,500.000, or 50 cents per ton, which is about the cost estimated from the company's reports. The ore bodies extend below the level of the lower bench, and underground exploration is carried on contemporaneously with the open cut system, which suggests that possibly the method at Mount Lyell might be improved under some circumstances, with somewhat of a reduction in cost.

(TO BE CONTINUED.)

High Duty Pumping Machinery.

Herewith is illustrated the Price Patent California Pump, of which the G. W. Price Pump Co., 523 Market St., Sau Francisco, Cal., are inventors, patentees and sole manufaeturers. It will be noted that the base plate and bearings are cast in one piece, with a view to prevent possibility of the bearings getting out of aligument. The bearings are bushed and babbited, and fitted with automatic ring oiliug devices. By adjusting the tension, the pump discharge or the suction elbow cau be easily made to point in any direction at right angles to the shaft. All the parts are iuterchangeable and guaranteed by the manufacturers to fit. They build several styles of pumps, and state that efficiencies on their speeial pumps have run as high as 89%.

The Price Patent California Pump.

Ore Deposits Near Igneous Contacts.*

Written by W. L. Austin.

In Mr. Weed's paper frequent reference is made to the Cananea copper deposits, which are said to have been so vigorously exploited that they produced 14,000,000 pounds of copper in 1901.

The ore bodies which yielded this large quantity of metal are described as a product of contact metamorphism, and in Mr. Weed's genetic classification of such deposits, they receive a place under the subheading, "Deposits impregnating and replacing beds of contact zone." They are considered by Mr. Weed to represent a special type under this head, and are further classified as: "1. Chalcopyrite deposits: (a) Pyrrhotite ores; (b) Magnetite ores, Cananea type."

In condensing much information into a comparatively small space, the presentation of a subject may be so abbreviated as to detract from its clearness. The situation of La Cananea, considering its importance from an economic as well as scientific standpoint, may be worthy of more detailed description. As Mr. Weed remarks, "structural differences are so important and have so marked a bearing, not alone on the theory of their genesis, but also on the working of the deposits and a determination of their value as mines, that they merit a full discussion."

It is my present purpose: (1) to show that it is doubtful whether the copper of La Cananea is mined, except to a limited extent, from contact-metamorphic deposits; (2) to emphasize the importance of the mineral-bearing porphyry in connection with the genesis of the Cananea deposits; and (3) to question the correctness of Mr. Weed's opinion that, in this locality "the deposits should extend downward in depth to the granular rock."

Contact-metamorphic ore deposits are very common in the West and Southwest. Among the better known of those in which copper is the principal economic mineral are those of the Seven Devils district, Idaho; Saline Valley, California; the Planet mine, on Bill Williams Fork, Marble mountain, in the Santa Catalina mountains, and Clifton, Arizona; La Cananea, and the Santo Nino deposits on the Yaqui river, Sonora; Terassas Station, Chihuahua; and La Jibosa mine, Valerdena copper mine, and Sacrificio mountain, Durango. There are many others which I have not personally visited, but concerning which I have received private communications, or have found described in current technical literature.

These may all be classed together as ore deposits occurring at or near the contact of igneous rocks with limestone beds, and owing their existence to the presence of the eruptives.

This general type of deposit is recognizable at first sight; but it is not always with a simple contact that the observer has to deal. Associated with the actual contact ore bodies are mineralized eruptives, fissure veins and replacements in the limestone. Mr. Weed, recognizing the variations displayed by deposits of this description, has proposed a tentative classification, which might be further discussed to advantage.

By reason of the very nature of the genesis of these deposits, there must be much diversity among them. In fact, hardly any two of them are exactly alike. They all have a certain mutual resemblance, and differ radically from any other class; but, unless a broad significance is given to the term contact metamorphism, it will scarcely cover them all, and, in any event, there will be almost as many "types" as deposits.

The selection of the Cananea deposits as typical of contact metamorphism, and the ascription to this type the large production of copper quoted above, seems to me to be ill advised; and the statement that in this instance the primary sulphide ore should continue of unchanged tenor in depth down to a hypothetical contact with granular rock certainly calls for further elucidation.

There are numerous contacts between the limestone and the igneous rocks of the Cananea district; in fact, all the limestone patches are almost surrounded by porphyritic rocks of one kind or another; but neither at any one of the important mines, nor at any other points so far as I know, has a contact between the limestone and a granular igneous rock been observed.

The ore deposits of La Sierra de la Cananea, as hitherto developed, are scattered through the mountains along a northwest-southeast belt for about 8 miles. Puertocito is at the extreme northern end of the belt; the Elisa mine is about the middle; Capote basin (with the Capote, Oversight, Veta Grande and Chivatera mines) are south of the Elisa; and at the southern end is the Cobra Grande mine. The Elenita deposits are really a part of Puertocito. At various points between these main ore bodies are smaller ones.

At Puertocito and Elenita there are masses of garnetiferous minerals with associated copper carbonates and silicates, pyrite, chalcopyrite and bornite; at the Elisa there are irregular bodies of chalcopyrite along a fault fissure in the metamorphosed limestone; at the Oversight and Capote mines there are much larger masses of feldspathic porphyry carrying chalcocite, which have yielded much the greater part of the copper produced in the district. The deposits of Elenita and Puertocito had no part in the large copper production mentioned in Mr. Weed's paper; not until late in April, 1903, was any ore shipped from this part of the belt.

At the present time (April, 1903) the Oversight mine occupies the place of honor among the developed properties, having temporarily exceeded the production of the Capote, which was the first large bonanza found in the district. The first-class ore of the Oversight is a soft, white feldspathic porphyry, heavily mineralized with chalcocite. At the southern end of the mine the surface indications of underlying ore bodies are so slight that one, not very familiar with the characteristics of deposits of this class, would hardly have ventured to predict the discoveries which have been made a few feet below. The porphyry at the top shows no mineralization, no gossan; no "copper stains." The solution which effected the decomposition of the original pyrite carried the iron with them and deposited it elsewhere—a process which can be seen in operation to-day in other parts of the district. In such cases silica and silicates are usually substituted for the minerals removed.

Underneath, there is an ore body of irregular shape, already developed for several hundred feet in depth, and in places several hundred feet wide. It is in reality a continuation of the Capote ore zone—a second great concentration of chalcocite in the porphyry. Its limits as here stated are merely those of the ore rich enough to be shipped; in fact, the chalcocite-bearing rock merges into cupiferous pyrite bodies of very much larger dimensions, but of lower grade. This much is known; but what is the extent of these ore bodies, or how many more of them there may be, has not yet been ascertained. Only the first class and the higher grades of the second-class ore are at present taken out; lower grade material is left standing.

It is not my present intention to discuss the extent and value of the Cananea ore bodies. That matter has been briefly touched upon only to bring out the fact that, by far, the greater part of the copper produced by the mines of La Cananea has come from masses of mineralized porphyry and not from "chalcopyrite ore bodies carrying accessory galena * * * practically confined to the rocks resulting from the alteration of impure limestones." A statement of this kind, coming from such an authority as Mr. Weed, might possibly cause others to feel warranted in making large expenditures upon deposits of the class indicated, basing their hopes on the supposition that the bonanzas of La Cananea were found in the contact-metamorphic deposits, with a probability of their extending "downward in depth to the granular rock."

Porphyry is by far the predominating rock along the Cananea ore belt. I use the term "porphyry" in its general sense, for there are several varieties. Possibly all varieties have had their origin in the same eruptive magma, the sub-species being due to magmatic differentiation, or to the incorporation of portions of other rocks with which the eruptives came in contact. In places is found typical quartz-porphyry; but where the ore bodies occur the quartz is not so much in evidence. There are in the district other varieties of igneous rocks, such as granite, diorite, diabase and andesite; but these are mostly at some distance from the ore belt, and, as far as I know, are not mineralized to any noticeable degree. The porphyry, however, wherever it has been artificially exposed within the entire length of 8 miles here in question, is more or less pyritic, and in places the sulphides are massed so as to form ore bodies. The mineral belt has been extensively prospected, and tunnels many hundreds of feet in length cross its trend in a number of places. In these tunnels, many of which are considerable distances away from the producing mines, this mineralized porphyry is exposed, and at such points its character can be studied to advantage. It extends from the mines on the extreme north to those on the extreme south, and is essentially the mineral-bearer of the district. The limestone occurs only in spots. Where the heavily mineralized porphyry has come into contact with this limestone, there are the usual contact-metamorphic phenomena; but these ore bodies are of subordinate commercial importance—in fact, but for the mineralized porphyry the history of La Cananea would have been a totally different one.

The quartzites do not contain mineral deposits, except where cupriferous solutions from the decomposing porphyry have found cracks and fissures in which to deposit their burdens, and these are practically a negligible quantity.

Where the limestone has been metamorphosed by contact with the porphyries, it has become one of the most, if not the most, resistant of the rocks of the district. Proof of this statement is furnished by the garnetiferous bluffs which constitute such prominent landmarks at the Puertocito end of the belt. Not in this district only, but everywhere, such resistance to weathering is characteristic of rocks thus metamorphosed; for the process itself is largely one of silicification.

The ore bodies which have made La Cananea famous are soft porphyritic masses, partly of mineralized porphyry, partly of dark-colored plastic clay, less heavily charged with copper ore. The one merges insensibly into the other, and much of the material is of a nondescript character, depending on the degree of decomposition which the rock has undergone. It bears no resemblance to metamorphosed limestone, although fragments of that rock are found in it, as are also masses of quartzite.

It is common, where porphyritic flows have broken through limestone beds, to find included masses of the latter caught in and surrounded by the porphyry, and the Cananea deposits are no exception.

The ore is so soft that no amount of timbering can hold the workings open; the stopes have to be filled as soon as the ore is removed. The ground swells to such an extent that on the third level of the deep Capote workings the shaft can only be kept open by maintaining a passage way around it. In the bottom of the mine the tops, sides and bottoms of the drifts are squeezed together, like those of a tunnel run into a bank of plastic clay. One peculiarity of the low-grade ore bodies is that, although the rock may have lost its pristine character and may be as soft as stiff putty, the pyrite distributed through it is unoxidized and bright, even on its surface.

The ore from the Capote and Oversight mines comes to the concentrator and smelter mostly as whitish-gray clayey "fines." In the concentrator the Oversight ore in particular gives trouble, because it "thickens" the water, thereby preventing the mineral from separating out. On the concentrating tables, garnets and similar minerals, characteristic of contact-metamorphism, are noticeably inconspicuous. At Puertocito the mineralized porphyry taken from one of the shafts "slacks" in the air to a powder.

That white feldspathic porphyry similar to, if not identical with, that of La Sierra de la Cananea, may be itself a highly cupriferous mineral bearer is evidenced by the deposits at Ajo, in southern Arizona, not far northwest of La Cananea. Here masses of mineralized porphyry form hills within a basin of other eruptive matter. The rock is pyritic throughout, and in places the ore is identical with that of the Capote basin. I noticed no sedimentary rocks at Ajo. The ore bodies are porphyry, carrying pyrite, with chalcocite, and other cupriferous minerals.

At Clifton, also, notably on Metcalf hill, the mineralized porphyry, constituting the ore bodies of the Arizona Copper Co., is of similar nature, if not the same, as that of Ajo and La Cananea. And the same may be said of the rock in which lies the large pyritic body of Iron mountain, in California.

For the reasons above given, and without wishing to disparage the statements of such an eminent and accomplished geologist as Mr. Weed, I question the propriety of describing the large copper producing ore bodies of La Cananea as a type of contact metamorphic deposits. The porphyries have certainly taken a more important part in the genesis of these cupriferous deposits than that which he has assigned to them. At Puertocito, as well as in the Capote basin, it would seem to be more in accord with the facts to assume that the pyritic minerals brought up by the porphyry became, through magmatic differentiation, more concentrated in certain localities than in others, and that these heavily mineralized portions were very susceptible to attack from atmospheric waters. In the Capote basin, where the mineralization was the greatest, the porphyry yielded readily to decay, the result being the formation of ferric masses (gossan), which were left on or near the surface, and the concentration of the copper below in the form of chalcocite. The gossan found on the top of the ground is a fairly good flux, and is used as such; but it becomes more and more siliceous with depth, until it rests on the ore. It presents an irregular bottom limit, penetrating the ore in places. Immediately under the gossan comes the chalcocite bearing porphyry. At the junction of the two native silver is sometimes found. The workings in this portion of the Capote mine were very hot, and the more it was attempted to ventilate them, the hotter they became. Quartz sand also (used for building purposes) was found in this zone.

There are contact metamorphic deposits at La Cananea, but they were of comparatively subordinate importance in connection with the output of copper in 1901, and they are still subordinate. The main ore deposits are concentrations in the porphyry of chalcocite derived from cupriferous pyrite, which came up as an accessory component of the original rock.

A correct diagnosis of the genesis of an ore deposit is of more than scientific interest; it is of great economic importance. A better appreciation of this truism by those in responsible charge of mining operations would result in the saving of vast sums of money which are uselessly expended at the present time.

In regard to the occurrence of arsenopyrite in or close to contact metamorphic deposits, the case of Sacrificio mountain, in Durango, might be cited in addition to those mentioned by Mr. Weed. These deposits, which are typically contact-metamorphic in the sense given the term by Mr. Weed—"zones of altered sediments about igneous intrusions"—are associated with veins of arsenopyrite.

*Abstract W. H. Weed's Paper Amer. Inst. Min. Engrs.

The Assaying of Silver-Gold Bullion.

Written for the MINING AND SCIENTIFIC PRESS by H. B. KAEDING.

While much has been written on the subject of bullion assaying, and while the methods are in general well known, different schemes are often worked out along well known lines to fit varying conditions; recently the writer was placed in a position where the assaying of the bullion output of four stamp mills and two cyanide plants came under his direction, and as it was essential that absolute accuracy be maintained, after considerable experimenting the following method was found to give good results, and was adopted in the various assay offices:

The mill bullion ran about .550 gold, 370 silver and .080 base, the base metal consisting largely of lead; the cyanide bullion ran from .500 gold to as low as .250 gold, with about .100 base, and the balance in silver, the base metal in this case being partially copper.

It was found essential that the bullion be well stirred immediately before pouring into the moulds, in order to insure a homogeneous mixture of the metals, and consequent even sampling.

SAMPLING.—After trying various methods, the best satisfaction was obtained by drilling the bars; after a bar had been scoured clean, washed and well dried, it was placed under the drill press in a gold pan and six holes on the top and six on the bottom of the bar started well into the metal; these surface borings were then rejected, and the bar brushed and placed on a sheet of glazed paper, and the twelve drill holes sunk to a depth of about .75 of an inch. In selecting a drill for this work, one of $\frac{1}{8}$-inch diameter was taken, and care was exercised to get a drill that would deliver the borings in small, fine chips, rather than in one shaving; by using a very light pressure it was possible to obtain a finely divided product that permitted of thorough mixing on the paper.

WEIGHING.—After the chips were well mixed, an exact 500 milligrams was weighed and placed in the lead foil with the requisite amount of silver. In working with a bullion that runs fairly constant as to composition, the assayer will soon learn to guess or judge its silver content, rendering a preliminary assay unnecessary, and enough silver should be added to bring the total silver in the charge up to two and one-quarter the weight of the gold.

In cutting the lead foil for wrapping the chips, the foil was first smoothed with a pencil, and three sheets were laid together and cut with a sharp shears, giving three pieces of foil exactly the same size and weight, thus insuring "blicking" in the cupels simultaneously. These pieces of foil were twisted into three cornucopias, and the bullion chips and silver dropped into two of them. They were then squeezed into bullets and were ready for the muffle.

Two charges were made from each sample and the third piece of foil used for the proof assay; this proof was composed of pure or "proof" gold and silver, and was made up by taking a weight of proof gold equal to the supposed weight of gold in the bullion charges, and adding two and one-quarter its weight of silver, thus giving a proof in which the exact gold and silver content was known.

When running samples from more than one bar it was found advisable to cut the lead foil so that each set of three pieces was progressively smaller than the first set cut; by placing the largest three in the first row of cupels, decreasing in the others, it was possible to have the first row of buttons "blick" first, and the others in rotation, giving convenience in handling in the muffle.

CUPELLING.—Twice as many cupels were placed in the muffle as were necessary, thus giving a hot cover for each button. When nicely hot, a piece of stick lead was dropped in each cupel that was to receive a charge, and as soon as this was driving nicely the charges were dropped in. In cutting this stick lead the same method of cutting three at a time was followed as in the case of the lead foil. The cupels were placed three abreast in the muffle, and the proof in each assay placed in the center cupel, with the duplicate bullions on each side of it. Cupelling carefully, and with the lead weighing alike in the three, they were found to "blick" at practically the same moment, and were covered at once with the hot extra cupels and moved toward the front of the muffle. By proceeding slowly in withdrawing the cupels from the muffle it was easy to obtain compact buttons and prevent sprouting or spirting.

DETERMINATION OF THE BASE CONTENT.—The buttons were brushed well and weighed; if the two duplicates were found to check fairly well in weight the results were averaged. The proof also was weighed and a note made of the loss of silver in cupellation; this loss was figured as occurring in the same ratio in the samples, and the factor so determined was applied correctively to the apparent weight of the silver in the assay. The method of figuring this will be readily seen in the example given below.

PARTING.—The buttons, of so nearly the same weight, have about the same diameter; hence, if rolled to the same length, will be of equal thickness, which was found to be an important point in maintaining the relations between samples and proof. The buttons were rolled to about 3 inches in length, annealing frequently in a spirit lamp during the rolling, and, finally, after the rolling was completed. If not kept soft during the rolling there was a tendency in small particles to flake off the surface, naturally causing loss.

The strips were then rolled around a glass rod and the coils parted in small flasks in the usual manner, using two strengths of acid. A small piece of charcoal dropped into each flask was found to prevent "bumping" during boiling. Parting being complete, the cornets were placed in annealing cups and washed thoroughly with a fine spray of distilled water, dried, annealed and weighed.

WEIGHING.—The weight of the proof was found to have increased, giving a surcharge that had to be taken into consideration when figuring up the results of the assay in the same manner as the loss in silver was figured. The final returns on the gold should check in the duplicates to the fourth decimal place, in which event they were averaged.

RESULTS.—When these methods were followed with care, and the bars weighed carefully, it was found possible to place in the hands of the management a value of the bullion that would be found to check within $1.50, in a bar weighing 1000 ounces, of the amount paid for it by the mint.

REMARKS.—We found that it was essential to success to see that throughout the whole operation the two charges and their proof received the same treatment; they had to be placed in the muffle and withdrawn simultaneously; they had to be rolled to the same thickness, parted with acids of the same strengths over one fire, all together, or else the proof ceased to be such. The object of the proof being to show the results of the treatment the samples received, it is obvious that the three charges had to be passed through the operation as a single unit.

We made our own proof gold by dissolving assay residues in nitro-hydrochloric acid and precipitating with ferrous sulphate; our proof silver we bought. In handling either it was of course necessary to use forceps to avoid contaminating with the fingers.

Method of figuring results on an assay of bullion known to contain approximately 500 points gold, 400 points silver and 100 points base in 1000:

No. 1.	Gram.	No. 2.	Gram.
Bullion taken	.5000	Bullion taken	.5000
Silver added	.3625	Silver added	.3625
	.8625		.8625
After cupellation	.8125	After cupellation	.8100
Apparent base	.0500	Apparent base	.0525
Average apparent base	.05125		
Gold residue	.25386	Gold residue	.25362
Average apparent gold	.25365		

Proof.	Gram.
Gold taken	.2500
Silver added	.5625
	.8125
After cupellation	.8025
	.8025
Gold content	.2500
Silver content, after cupellation	.5525
Gold residue	.2520

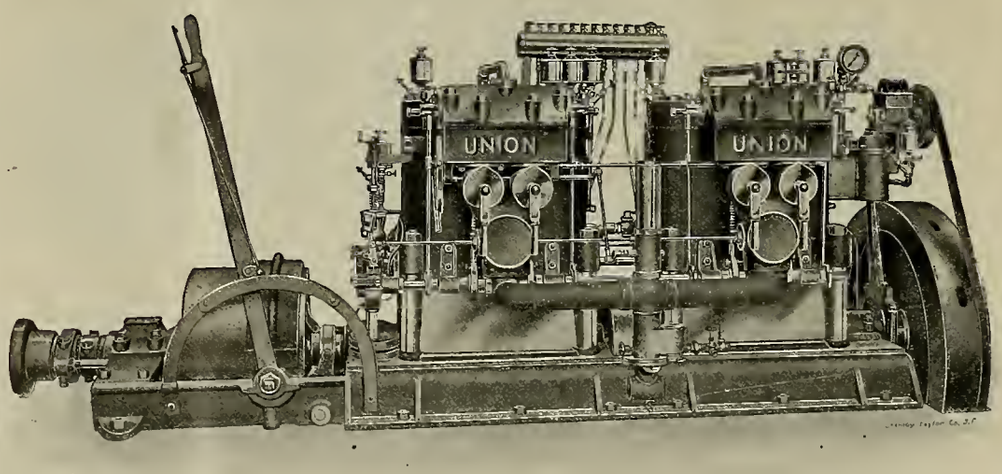
$\frac{250}{252} \times .25365$ gram $= .25045$ gram $=$ corrected gold weight.

$.500$ gram $- (.25045$ gram $+ .05125$ gram$) \times \frac{5625}{5525}$

$= .19830$ gram $\times \frac{5625}{5525} = .20189$ gram $=$ corrected gold weight.

$.500$ gram $- (.25045$ gram $+ 20189$ gram$) = .04766$ gram $=$ corrected base weight.

Final result in 1000ths:



Gold	500.90
Silver	403.78
Base	95.32
Total	1000.00

Marine Gas Engine Launch.

The accompanying illustrations show the launch Flyer plying on the bay of San Francisco, Califor-

Gas Engine Launch "Flyer."

Marine Gas Engine in Launch "Flyer."

nia. It is 51 feet long, 11 feet beam, and is fitted with an 85 H. P. four-cylinder Union engine, having all the latest improvements. This launch has a speed of about 13 miles per hour, and is a good seagoing craft. The weight of the engine is 6800 pounds, and at 500 revolutions per minute, which is an easy working speed for it, it will develop about 100 actual H. P. on the propeller shaft. The crank pins are lubricated by centrifugal oilers designed to enable the engine to run any distance at required speed without liability of heating. All the bearings are lubricated from a multiple sight-feed lubricator, which stands above the engine. The engine is also fitted with a sensitive governor, and a speed controller which operates on the governor, and enables the engineer to absolutely control the speed of the engine. The accompanying engraving gives a good idea of the general appearance of the 100 H. P. marine engine for the launch as depicted herewith.

The Union Gas Engine Co., of San Francisco, Cal., during the past season, has built a number of these four-cylinder engines, several of which are installed in launches on San Francisco bay, iueluding the 60-foot launch Idlewild, owned by C. F. Kohl; the Chipmunk, owned by Gordou Blanding; and the Vladimir, owned by F. A. Hyde.

Pneumatic Tools.

Compressed air devices are deservedly popular among machine workers because of their adaptability. Herewith are illustrated a few of the "Imperial" pneumatic tools made and furnished by the Rand Drill Co., 128 Broadway, New York:

FIG. 1.

Fig. 1 is a combination breast and screw feed drill; has compound gear, slow speed for heavy work and fast speed for light work; will drill up to $\frac{5}{16}$ inch in diameter in any kind of metal; air compressed per minute, 12 cubic feet; weight 8 pounds.

Fig. 2 shows a motor running at a rate of 3000

FIG. 2.

revolutions per minute, without any vibration.

Fig. 3 is an "Imperial" air motor hoist, made in all capacities up to 10,000 pounds, with chain or wire rope.

Fig. 4 shows an air tool that speaks for itself to any machinist. This machine is an effective tool and will consume 15 cubic feet free air per minute at eighty pounds pressure.

The Rand Co. make a specialty of installing complete air plants.

Assay of Tin in Tailings and Slimes.*

Written by GEORGE L. MACKENZIE.

One not infrequently hears it said by tin miners that there is no satisfactory laboratory assay for tin. There certainly is none which for rapidity, cheapness and comparative accuracy can compete with the vanning shovel, but it breaks down when tested with very fine slimes, and even with coarser samples one has only to examine through a lens the residue which the vanner weighs as tin oxide to see that the accuracy of this method is not such as would be accepted in a laboratory. If the vanner is directed to wash all gangue off his shovel, leaving only tin oxide, a low result may be expected. No one who has watched an experienced vanner at work can fail to be struck with the extreme neatness and dexterity of his manipulation; but, after all, vanning by hand and dressing by automatic machines are based on similar principles, and the causes which produce loss in the dressing plant tend also to cause loss in vanning. The manager who wishes to know exactly what his losses in dressing are must therefore resort to another method of assay, especially if he wishes very poor or very slimy samples tested.

This question was recently put before the writer by a tin mining company, and it has been suggested that details of the scheme of assay he employed might be useful to others, as many methods have been proposed and the testing of even one of them requires much time and patience.

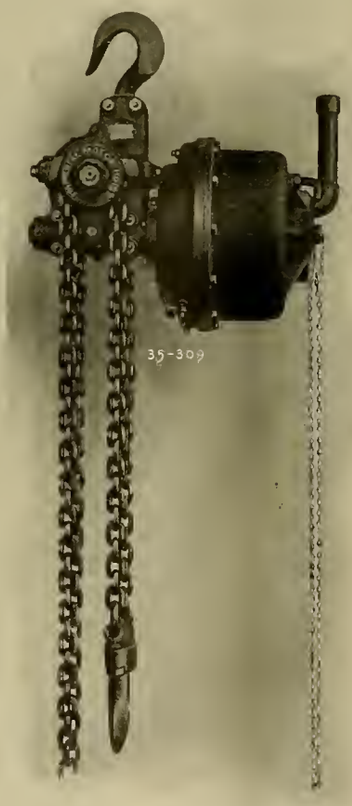


FIG. 3.

FIG. 4.

METHOD.—Clean the ore with aqua regia. Reduce the stannic oxide to tin by ignition in an atmosphere of coal gas (used as hydrogen). Dissolve out the tin with hydrochloric acid and free chlorine. Precipitate as stannic sulphide by passing hydrogen sulphide. Convert the stannic sulphide to oxide by ignition in a small weighed Berlin crucible and weigh as stannic oxide.

Take from 1 to 5 grams ore, according to richness, so as to get a weighable quantity of stannic oxide, 1 gram of a 2% ore is sufficient; if the ore is very poor, two lots of 5 grams may be combined after reduction separately in the combustion tube.

Crushing must be very fine, the sample well mixed and not shaken about afterwards or the tin oxide will get concentrated in the lower part of the sample. In quartering samples the finest dust left on the sampling paper will probably be the richest.

1. CLEANING THE ORE.—Cover assay with aqua regia in beaker or evaporating dish; heat nearly to boiling point for about twenty minutes, longer if wolfram is present. Dilute with hot water. Filter hot and wash well with hot water, especially if any lead is present in the ore. If there is tungsten or silver in the ore, digest the residue for about ten minutes with warm dilute ammonia; filter again and wash well the portion on the filter with the same reagent. Dry residue and brush most of residue off the paper. Burn the paper and add the ash to residue.

NOTE.—The solid residue from aqua regia consists mainly of silica, stannic oxide, small amounts of iron oxide, various insoluble silicates, and possibly sulphur and insoluble chlorides and oxides produced by the acids used. It is essential to remove here those which will not be removed in subsequent stages of the assay.

If tungsten is present in the sample, probably as wolfram or scheelite, the residue will contain tungstic acid, a yellow solid readily soluble in ammonia. This, if not removed, will count as stannic oxide, giving a high result. Wolfram, even when very finely powdered, is only slowly attacked by aqua regia, and time must be allowed for this. After treatment with ammonia niobic oxide, a white solid derived from columbite may still remain, but it is unlikely to be present in sufficient quantity to seriously affect results. If its presence is suspected, the substance weighed as stannic oxide may be tested for it and also for tantalic oxide.

2. REDUCTION OF THE STANNIC OXIDE TO TIN.—Heat the assay to dull redness for about forty minutes in an atmosphere of coal gas—$SnO_2 + 2H_2 = Sn + 2H_2O$.

NOTE.—A combustion tube works perfectly, although it is inconvenient to manipulate. Poor ores in 5-gram lots may be placed direct in the tube. Rich ores in 1-gram lots can be placed in china boats to avoid loss in getting them out of the tube. To place a 5-gram charge in the tube, it is convenient to have a tin spoon of semi-circular section, with a long wire handle.

Commence passing gas first. When all air has been expelled from the tube light the jet at its outer end, then warm the tube from end to end, place the Bunsen under the assay and cover the tube with a bent sheet of asbestos to retain the heat. Complete reduction of the stannic oxide in a large charge may be assisted by slightly turning the tube round once or twice to better expose the lower part of assay to the gas. Carbon is reduced from the gas and darkens the assay, but does not interfere. If any tungsten is present it will be partly reduced if the temperature is high and will give a high result. Any iron present is reduced, but is removed in filtering after passing H_2S at a later stage. After reduction is complete extinguish the Bunsen but leave the gas passing until the assay is cold enough not to reoxidize on admission of air. Most of the charge can then be poured out of the tube and the remainder cleaned out by a rod with a cork on its end if the sample is poor; or washed out with hydrochloric acid, if rich.

3. SOLUTION OF THE REDUCED TIN.—Transfer assay to a beaker. Cover with strong hydrochloric acid and add about 2 c.c. of a 10% solution of perman-

*Abstract Trans. Inst. Min. & Met.

ganate. Heat nearly to boiling for about twenty minutes, stirring occasioually. Add a few drops of permanganate towards the end. Dilute, filter into a beaker, washing residue well.

NOTE.—In this step all metals preseut are converted to chlorides, e.g.: $Sn + 2HCl = SnCl_2 + H_2$. Then $SnCl_2 + Cl_2 = SnCl_4$. The chlorine, liberated by the permanganate, assists in the solution of the tin and further converts it to the stannic condition.

4. PRECIPITATION AS STANNIC SULPHIDE.—Partly neutralize the filtrate by adding sodium bicarbouate cautiously until effervescence becomes less brisk, but the filtrate must remain acid. Pass hydrogen sulphide. The precipitate is stannic sulphide, and should be yellow or brownish yellow. Allow assay to stand as long as convenient—over night if possible—to allow precipitate to settle and clot. Filter on small ashless paper. Wash well with solution of ammonium acetate containing a little free acetic acid. The sodium salts now preseut should be completely washed ont.

NOTE.—As strong hydrochloric acid attacks stannic sulphide, it is better to reduce the acidity as above. The solntion must remaiu acid to kcep np metals other than tin. The precipitated sulphide is very finely divided and apt to pass through the filter paper; this is partly counteracted by allowing the precipitate to settle and clot, and also by the sodium chloride produced by the addition of the carbonate.

5. CONVERSION OF THE STANNIC SULPHIDE TO OXIDE.—Dry thoroughly the paper containing the precipitate, which will darkeu considerably. If small in quantity all had better be left on the paper. Holding the paper between a small pair of forceps, burn it as completely as possible and drop the ash into a small weighed Berlin crncible. Add one or two drop of nitric acid and heat gently until dry. Iguite over blowpipe, first gently, then strougly. Cool and weigh as stannic oxide.

NOTE.—The sulphide can be burned to oxide without the addition of nitric acid, but loss may occur, as the sulphide is slightly volatile.

TEST ASSAYS.—For these prepare artificial ores of pure silica and stannic oxide. The former, if ignited, is very hydroscopic, so must be kept in a stoppered bottle. The latter must be tested for purity, and had better be prepared from the purest tinfoil obtainable, by boiling in nitric acid, filtering, aud washing with hot water until filtrate gives no precipitate (PbS) with hydrogeu sulphide.

A 1% ore and aud a 0.5% ore should be sufficient, and after very little practice an assayer should be able to get the full tin content ont of these samples, but must be on his guard against some of the very finely divided silica passing through the filter.

The hydrogen reduction can be checked by saviug the residue and re-igniting in the tube. This should not be omitted where close accuracy is required, aud, in ordinary practice, time can be saved by adding the solution obtaiued iu stage 3 from the residue to the similar solution already obtained iu stage 3 of the assay aud theu passing hydrogen sulphide through the combined solutions.

The tendeucy in most steps of the assay is to get low results, and the manipulation requires time and patience; but the assayer who works on artificial ores of knowu tin contents unti. he can trust himself will be satisfied with the method for the purpose of mine assaying.

Low results arise from incomplete reduction, incomplete solution of the reduced tin, and volatilization of the sulphide by too hurried ignition. Of these the first is most probable, and an assayer would be wise to at first save the residues from stage 3, re-reduce them in the tube and run them as separate assays, hus determiniug for himself the probable error due o this cause in the ores of his mine. The greater he proportiou of silica present the less complete is the reduction apt to be. In reporting results it should be borne in miud that "black tiu" is impnre stannic oxide, the actual tin coutent varying on different mines.

The last series of assays run by the writer gave the following results, 4-gram ore being taken for each experiment:

	Stannic Oxide Got.		Stannic Oxide recovered from residues by a second reduction in tube.		Total
No.	Grams.	Percentage.	Grams.	Percentage.	Percentage.
1. . .	0.230	5.75	0.0020	0.050	5.800
2.	0.230	5.75	0.0031	0.077	5.827
3.	0.0238	5.95	0.0031	0.077	6.027
4.	0.230	5.75	0.0033	0.082	5.832

The residues from Nos. 1 and 2 were reduced a third time in the tube, but only a tracе of tin was got.

To illnstrate the interference due to wolfram four charges of 4 grams each were taken from the above sample; to each 0.01 gram taken from a crystal of wolfram was added and the residue from aqna regia was not treated with ammonia, the resnlts being the following:

	Stannic and Tungstic Oxide Got.		Recovered From Residues by a Second Reduction in Tube.

4.	0.0270	0.675	Not re-reduced	....

Treatment of Telluride Ores at Kalgoorlie, Western Australia.*

NUMBER V.—CONCLUDED.

Written by W. E. SIMPSON.

SUMMARY.—Of the two processes at work in Kalgoorlie, it is difficult to say which is the better. Both are snccessful, and each has a large number of supporters. Wet crushiug is generally admitted to be cheaper aud better than dry crushing, though in Kalgoorlie it is supposed to be severely handicapped by the high cost of water. It may be paradoxical, but an investigation of the facts tends to show that the "dry" process is a greater water consumer than the "wet."

The amount of water used in any plant shonld be the sum of the moisture sent out with the residues, and the quantity lost by evaporation, leakage, of course, being inadmissible. The residues from the wet process contain only 8% to 10% of moisture, as against 18% to 24% in the residues from the dry; this is due to the alteration in the chemical and physical character of the ore treated; and the loss by evaporatiou can not possibly be so great where the battery water, solutions, etc., are only at the temperature of the surrouuding atmosphere, as where hot ore is a constituent of the working pulp. Besides, if, as is often the case, the ore is wet from actual mine water, the battery gets the benefit; whereas, for the dry process the ore must be as far as possible free from moisture; the smallest percentage seriously restricts the mill's capacity; and if the amount exceeds 3%, operatious are practically brought to a standstill. On the Boulder Main Reef nothing but perfectly dry ore is seut to the extraction works; any wet stuff is dumped on the surface aud allowed to dry in the sun before treatment.

In the "all-roasting" process, the disturbing element, tellurium, is eliminated in the early stage under advantageous conditions, and the loss in gold, if any, is so small as to remain undetected by assay. The mechanical loss, too, can not be great, for the reason that the fine dust sent into the atmosphere is composed of particles of low specific gravity, and, consequently, of low assay value. On the Boulder Main Reef it has been found that the flue dust obtained in treating ore containing more than 1 ounce per ton assayed only 13 dwts., and, as it is ouly reasouable to assume that what does settle in the flues is a conceutrate compared with what escapes by the stack, the losses due to roasting raw ore must be small. It has also been noted on the Great Boulder Proprietary that the fluc dust is poorer iu gold than the ore which is being treated.

In the Diehl process, as practiced at Lake View Consols and Haunau's Brown Hill, the object of concentration is to bring the refractory elements into the smallest possible bulk aud reduce the quantity to be roasted. The actual amount of sulphur, tellurium, etc., to be climiuated is not diminished in any way, and the furnace which can roast twenty tons of ore per day will treat efficiently, perhaps, only eight or ten tons of concentrates. The tendency in the large Diehl plants is to elaborate the coucentratiou, treat the product by roasting and "sliming," and thns reduce the consumption of expensive chemicals. On the Lake View Consols, from a monthly yield of 5000 ounces fine gold, 50% to 60%, or nearly 3000 ounces, is obtained from treating wasted concentrates, and the remainder by the wet method aud use of cyanogen bromide.

While a small loss may occur through volatilization, etc., in the "dry" process, it is only reasonable to assume that at least an equivalent if not a greater loss occurs in the "wet." The concentrates contain a comparatively large percentage of volatile snbstances, they assay six or eight ounces per tou, and they are roasted in au atmosphere which is chloridizing, from the salt ever present in the concentration water, and the flue dust assays 10 to 15 ouuces of fine gold.

The popular notion is that, in treatiug tellurides, cyanogen brómide eliminates the tellurium, and thus takes the place of roasting; but this is a great mistake. Bromo-cyanide simply acts as a sort of shnnting agent, setting aside, as it were, the tellurium in appreciable quantities aud that the residues leaving it do not. My investigatiou shows that the tellurium is oxidized iu the agitation vats and subsequently precipitated, probably in the metallic state, iu the extractor boxes, and we are brought face to face with the fact that, no matter what may be the process in use, the tellurinm must be got rid of by roastiug.

The Hannan's Star Co., which has to pay no royalty on its Diehl plant, as it introduced the process, recovers what little gold is amalgamable on copper plates, and the rest by means of cyanogen bromide. It does not concentrate the ore, but relies for good extraction on a very fine pulverizing, prolonged agitation, and a slightly greater consumption of chemicals. The secret of snccess in this kind of treatment lies in the fortnnate fact that tellnrides are extremely friable and can be redneed to a powder so fine as to be readily attacked by dilute chemical solvents.

Tellnrides usually occur in coarse specks, are nonamalgamable; and, if they were malleable like the precious metal itself, it seems probable that the extraction with cyanogen bromide alone would be but little better than would result from plain cyanidation of an ore containing coarse gold.

The advautage of the dry process is due to its simplicity and rapidity of action, and to the fact that a large proportion of the gold yield (50% at the Great Boulder Proprietary works) is recovered iu the grinding pans within a few hours of entering the plant, and that the tellurium is eliminated iu the early stage of the treatment, any further risk of gold loss from this source being theu at an end.

The cleanup is a comparatively light operation, involves no difficulties aud gives little trouble. The bullion slime is of small bulk and is merely dried, not roasted, before being smelted. At the Boulder Main Reef extraction works it is not even stirred or rabbled in the bullion muffle, and it is smelted direct into minting bars without even the process of remelting.

In the Diehl process the tellurium is everywhere present; the bullion slime is loaded with it, and roasting in a muffle, even with a considerable amount of rabbling at a fairly high temperature, only partially eliminates it; it is found in the melting pot, aud coats all the gold bars, and even appears in the bars themselves, rendering them occasionally so brittle that they break when struck with a 2-lb. hammer during the process of chipping off the slag; it often gives rise to what is called a "matte," a product having a specific gravity of 9.09, which, on analysis, is found to be eomposed of 30% gold, 30% silver and 40% tellurium. This "matte" does not make its appearance when the roasting and smelting have been conducted at a very high temperature. It is evideut in this case that the tellurium has all been driveu off, and it seems probable that at least a mechanical loss of gold occurs during the volatilization, as the bullion slime is exceediugly soft and powdery and has none of that gluey cohesiveness so noticeable in slime obtaiued from the dry method of treatment.

In spite of these drawbacks, I consider that the Diehl process has a big future before it. Its great advantage lies in the fact that it enables wet crushiug to be adopted, thereby increasing the efficiency of the crushing appliances and ridding the mill of the objectionable dust so deleterious to the health of the workmen.

The contour of the country unfortunately allows of practically no natural advantages for the disposal of residues. On the Lake View Cousols the mill is situated on the nearest hill, and the ore is transported from the shaft along an aerial ropeway, and, in the case of the Boulder Maiu Reef and the Great Boulder Proprietory, the plants are erected on the flat, close to their respective shafts, and the residues have to be elevated to the dump after treatment. The cost of power on the Lake View Consols is stated to be higher than would result were their treatment plant better arranged, the Great Boulder Proprietary admit that ball mills in their plant would be an improvement, and the Bouldcr Main Reef claim that if their roasting capacity were increasecl by the addition of another furnace, the mills could be kept ruuning continuosly instead of intermittingly, and all the plant being then fully employed, the cost per ton would be considerably reduced.

In the discussion on the paper of Mr. Simpson, A. G. Charleton said, with regard to the push conveyors, he had seen them at work on the Great Boulder and at other mines, and was very much impressed with the way in which they handled the stuff, often in a very hot coudition. They seemed simple and easy to repair. He had also seen the Merton furnace at work. This appeared a decided improvemeut in mechanical arrangement on other furnaces, and from what he was told of the coursc of working, he thought the results were good. The author evidently had a prefereuce for the Ball mills, but he did not see that the table of results bore out all of his contentions.

The Diehl costs given, although recent, were apparently not the latest figures published, because according to recent report from Kalgoorlie, the cost at Lake View had becn brought down to 15s 1d. He had looked into the question very carefully some time ago, as to the relative cost of the two proeesses, and came to the same conclusion as the author, that there was very little to choose between. When he visited Kalgoolie last April, however, the Diehl process seemed to have made a distinct advauce in the reduction of costs; but the dry-crushing process had also followed suit, as he noticed in an article written by Mr. Hoover some time ago the cost at the Boulder Perseverance treatiug 12,500 short tons was only $3.65, which was, roughly speaking, only about 15s 2d a ton. Practically, therefore, the two processes seemed to have kept pace with one another.

W. McDermott said the paper of Mr. Simpsou was valuable, but did not thiuk it had succeeded in settling the qnestion of the choice of process. The impression left on his miud with regard to the treatment in Kalgoorlie was rather that it did not seem a matter of the machinery used, but, whatever process was adopted, it was about equally good. The district was peculiar in that way just as it was in a mining sense. Iu no other mining district would they find such a variety of absolntely different proeesses all successfully going on.

*Abstract Trans. Institution Mining and Metallurgy.

Mining Summary.

SPECIALLY COMPILED AND REPORTED FOR THE MINING AND SCIENTIFIC PRESS.

ALASKA.

The Treadwell M. Co. at Douglas is adding to its holdings, having bought the Juneau-Alaska group on the mainland across Gastineau channel, opposite the Treadwell. A tunnel 2 miles long will be run to open the bodies of ore. There are 63 miles of tunneling in this mine, and one of these tunnels is said to extend out under the sea for 1200 feet. On the surface are 6 miles of tracks to keep the Treadwell plants in operation. Two hundred tons of coal a day are required. The 800 stamps crush 4500 tons of rocks daily, and the concentrates are carried in ships to the Tacoma smelter.

ARIZONA.

Cochise County.

In the Huachuca mountains, southwest of Bisbee, the Mitchell C. Co. reports No. 2 shaft has cut a seam of low-grade ore 1 foot in thickness at depth of 200 feet. This seam has a dip of 45°. At depth of 250 feet, 50 feet below the point where the vein was cut, a crosscut was started and has opened the vein at 50 feet north of the shaft, showing it widened to 4 feet, and assaying 3.26% copper and 3.8 ounces of silver. Sinking has been resumed in the shaft, which will be carried down another 100 feet, and at the 350-foot level another crosscut will be driven. In the veins lime and iron are mixed with copper glance, copper pyrites and peacock copper.

Graham County.

On the claims of the Markeene C. Co., near Morenci, L. A. Dunham et al. are preparing to begin further development. The nine claims are in the Copper King belt, and there are two shafts, one down 175 feet and the other 150 feet. In the bottom of the last there is a showing of ore. In the other shaft there are 15 feet of work on a rich 6-inch vein.

An electric trolley line equipment is being put into the Humboldt tunnel of the Arizona C. Co., near Clifton.

A tunnel 1000 feet in length to connect the Old Yankee and the West Yankee will be started this week by the Detroit C. Co. and is expected to be completed within six months. The tunnel is to do away with the hoist from the Yankee and elevate the ores of both mines from the shaft of the West Yankee. Machine drills will be used in the tunnel. It will be started from the lower level of the Yankee, 126 feet deeper than the 300-foot shaft of the West Yankee, which latter will be sunk.

Maricopa County.

(Special Correspondence).—J. V. Creath & H. H. Mullen are developing a group of claims 14 miles southwest of Mesa and will handle the ore taken out in an arrastra.

Fleming Bros. have several men at work on the Charley Fleming group of claims near Cave Creek. A strike of high-grade free-milling ore is reported made on one of the claims. More men will be put on.——The Grand Traverse & Arizona Co. is working men on its group near Gold Hill, in Cave Creek district, and the number will be increased this week.——J. G. Hardin is working men on claims near New River.

The parties cyaniding the tailings from the Vulture mill, north of Wickenburg, have made a partial cleanup, with satisfactory results.——A. S. Mills is developing copper claims near Gold Hill, near Cave Creek, and is taking out shipping ore.

W. Waddington and J. Montgomery are developing a group of claims in the Eagle Tail mountains, near Phœnix. The number of men will be increased next week.

N. L. Brunor, assayer for the White Tank M. Co., in the White Tank mountains, says twenty men are employed at the camp. Water is hauled from Beardsley, and ore is being shipped to the smelter.

Phœnix, Dec. 21.

Mohave County.

At the Leland and Mitchell mines of the Mohave G. M. Co., near Acme, the bins have been completed and the trains began carrying ore to the mill this week. The company is working forty men at the mine and is driving the tunnel into the hill. The south tunnel is in 700 feet and the tunnel from the north side of the mountain has reached 500 feet. It is thought that by Jan. 1st the new mill will be running steadily. The mill is of forty stamps and is fitted with plates and concentrators.

The Altata M. Co. has begun operations on the Altata mine, near Chloride. The company put in a hoisting plant of capacity to sink to depth of 1000 feet. The mine is a former producer.

C. J. Greene, superintendent of the Swiss-American group of mines, near Snowhall, near Kingman, says work will be resumed and development increased.

Pinal County.

(Special Correspondence).—It is proposed to build a custom smelter near Florence in the spring.——The Copper Butte M. Co. is preparing to put in a hoist on its mine, between Kelvin and Florence.

Florence, Dec. 21.

Yavapai County.

Men have been put to work in the Silver Flake mine, near Groom creek, which has been idle for several years. J. J. Philbin is part owner. It is equipped with steam hoist and stamp mill.

The Peck mine in the Bradshaw mountains is being unwatered, heavier pumping and other machinery having been put in. H. B. Clifford of New York is owner. The ores formerly produced carried principally silver values, with some gold.

The Kimball mine on Lynx creek hill, near Lynx Creek, has been cleaned out, drained of 90 feet of water, and the shafts and drifts retimbered. Development work is again under way. This mine has three shafts, 200, 70 and 35 feet in depth with drifts 100 feet in length from which ore has been stoped. The ledge is 6 feet between walls with 2 feet of pay ore. A hoist and other machinery are being put in at the Great Republic group near Turkey Creek station on the Crown King railroad near Prescott, and work of developing the property will be increased. The company owns thirty-seven contiguous claims.

J. J. Philbin last week put men to work on the Silver Flake group of mines, 7 miles south of Prescott, near Groom Creek. The vein shows ore 5 feet in width. There is on the property a 10-stamp mill, a 120 H. P. Corliss engine, 120 H. P. boiler and a steam hoist, where a pumping plant forces water from Groom creek, 2200 feet distant, through a 4-inch pipe to a reservoir.

ARKANSAS.

Marion County.

Manager Chaso reports a discovery at the Morning Star mine, near Yellville. He had reached a sand and quartzite bar and passed on through it, reaching a deposit of zinc that in mill run yielded 50% of jack. This opening was made 150 feet above the level of the creek, and there is natural drainage.

At Dodd City, a concentrating plant is being built by the Iola M. Co. Six teams were used to haul the boiler from Harrison to Iola mine.——The Hill-Fountaine Co. reports satisfactory prospects near Peel. The core drill for the Jonesville mine has been put to prospecting. S. R. Reese is doing final assessment work on sixteen mining claims.

Newton County.

J. G. Atkins of White Eagle, Okla., president of the Buffalo M. Co., and H. P. Ladd of Ponca City, report work being increased on their group in Boxley district.

Searcy County.

At the Jack Pot mine, near Marshall, machinery for the crusher has been set up.

White County.

The Jones & Gilcriss zinc mine of Searcy has put in a heavier steam hoister and other shaft machinery.

CALIFORNIA.

Fresno County.

The Grass Valley Coalinga Oil Co. and the Coalinga Banner Oil Co., both of Grass Valley, have joined interests. Both companies hold adjoining ground in Coalinga district. W. G. Thomas and D. E. Morgan of Nevada City are interested.

Kern County.

The Arcata Oil Co., on the divide between Sunset and Midway districts, struck oil last week at a depth of 1750 feet, says Manager A. W. Gilfillen of Bakersfield. This well is near the Vulture, which quit work at 1400 feet.

Mono County.

The Castle Peak gold mines at Castle Peak, near Bodie, are closed down for the winter, says Superintendent Mitchell. The company will renew operations in the spring.

Nevada County.

Machinery is on the ground for the North Star G. M. Co., near Grass Valley, for the 40-stamp mill being built at the Central shaft of the company.

M. Owens is arranging for resuming work at the Standard mine at Deadman's Flat, near Nevada City. Owens is owner of this and other properties in same district. Considerable work has been done.

At the Champion mine, near Nevada City, since work has been resumed, forty stamps have been kept running on ore, and developments are showing satisfactorily, says J. Eddie, superintendent.

It is reported work will be started in January on the Cold Spring mine, near Nevada City. This mine has been idle for twenty years, since the last work was done by the Cold Spring Co. It adjoins the Harmony mine, and its reopening is expected to result in starting work on a number of other gravel mines on Washington ridge.

J. C. Campbell has completed arrangements to consolidate the Mountaineer, Summit and R. C. mines, near Nevada City. The pumps are unwatering the workings.

The Summit mine (formerly the Fortuna) was worked five years ago, when the shaft was opened and sunk to depth of 400 feet. The machinery was inadequate to handle the water.

The electric plant built on Poorman's creek, ½ mile from the mine, by the Gaston Ridge Co., near Washington, is in operation. Ore is being taken out of the 300-foot shaft, which is below the level of the tunnel. The latter is in 2000 feet.

The 20-stamp mill at the Blue Tent gravel mine is completed, but it is expected it will be several weeks before the mill will be started, as an elbow to connect the pipe line must be put in. The main tunnel is being driven ahead before an upraise will be made to tap the gravel channel. The 3-stamp mill formerly in use has been placed in order and will also be used.

The Phelps Hill Dev. Co. has temporarily suspended work at the mine near Grass Valley.

Work is progressing at the Federal Loan mine in Willow Valley, near Nevada City. Eleven men are employed and are taking out fair grade ore, which the mill is crushing. At present no development work is being done.

The stamps are dropping again at the Union Hill mine near Grass Valley on rock taken from the old surface workings.

The mill at the Zeibright mine near the Placer county line, south of Grass Valley, has been completed and is expected to be put in operation this week.——A 20-stamp mill will be built on the Bonnie B. mine, near the Zeibright mine.

The South Yuba M. & S. Co. is reported to have bonded six of its claims on the South Yuba river, near Grass Valley, to San Francisco and Philadelphia men for $500,000.

Manager J. Underwood says the Omega M. Co. has completed 3000 feet of flume near Nevada City. The work at the mine has been delayed on account of trouble in getting in lumber. When the restraining dam is completed, which is expected to be this week, all preliminary work shall have been completed. Lack of water prevents starting of mining as yet. The tunnel driven will be used for drifting purposes and work on it will not begin till spring. The drift will be run from the north side of the claim.

Plumas County.

H. Kling of Seattle, Wash., has made arrangements to open up and operate the Emigrant Hill placer mine north of Quincy, and preliminary work is being done. A debris restraining dam will be started this week.

G. R. Goodhue, operating at Iron Bar, near Quincy, reports the cement gravel crusher put in the past summer is working satisfactorily. It can be cheaply operated, one man handling the machinery when it is working to its full capacity, of 125 tons per day. The principal work that has been done there this season, besides putting in the machinery, was stripping the hard top cement preparatory to working the softer deposit near the bedrock. Goodhue also has started work on the tunnel near the Shoofly bridge and will keep two shifts at work all winter.

San Diego County.

The Cleveland–Pacific mine, near Escondido, an extension of the Oro Fino mine, has expended $30,000 in retimbering the mine, repairing the mill, removing machinery, etc., preparatory to resuming production.

Shasta County.

Development work is progressing at the Pawneo group of seven claims owned by O. B. Sherman, H. G. Schrivner and J. T. Weeks, on Wildcat creek, a tributary of Pit river, which empties into that stream from the south opposite Brushy canyon, near De Lamar. Mineral bearing rock was found on a contact between granitoporphyry and diorite, says the Enterprise. A 50-foot open cut and a drift of 30 feet on the ledge showed ore assaying $4.50 for width of 20 feet. A tunnel will be started lower.

Keswick reports say the crosscut on the Evening Star mine in the Old Diggings district, owned by Panter & Litsch, was completed last week, resulting in tapping a pay shoot at depth of 150 feet lower than any other workings in the mine. The main tunnel is 1000 feet in length. The body of ore is said to be 3 feet in width.

Siskiyou County.

J. F. Welch is opening up a hydraulic mine at Grouse creek, a tributary of East Fork of Scott river, near Callahans, for a San Francisco company. Teams are hauling lumber, machinery and pipe from Gazelle depot to equip the mine during the winter and spring.——The dredger in South Fork of Scott river, worked by electric power, is in full operation raising bedrock gravel, and report realizing good returns.——Teamsters are hauling lumber and supplies to the Kinley quartz mine on Humbug creek, near Hawkinsville, says Manager Draper. The mill machinery has been hauled in, and 100,000 feet of lumber bought. There are fifty men at work getting out quartz.

A. C. Brokaw of Quartz Valley has bonded the Mountain Lion, Advanco and Outlet quartz mines in Liberty district for $70,000. He will put men at work Jan. 14th for development and build a mill.

The Fort Jones Farmer and Miner says J. W. Wheeler of Fort Jones has arranged to put machinery on his claim in Scott river for opening the channel and prospecting the same.

The Medina M. Co., operating the Gardner and Eastlick quartz mines at Oro Fino, is rushing work to have its machinery in place and under cover before snow begins. An engine, pump and hoist are going in. Besides the machinery, a 50-ton cyanide plant will be built as soon as outside work is completed.

The Dewey quartz mines, near Yreka, continues to yield satisfactory returns, says the Journal, and the 10-stamp mill is kept in operation crushing picked quartz. The lower grade ore is put through the cyanide process. The company intends putting up a larger mill, adding more stamps, to be run by an electric plant with water power from Parks creek. There are 1000 tons of quartz on the dumps, which will not pay to run in the small mill of steam power, burning six cords of wood or more per day.

Tuolumne County.

The Big Tree M. Co. has bought 480 acres of mineral land on the Tuolumne side of the Stanislaus river, near Big Trees, above Murphys.

At the Cordova claim, above the Dreisam, near Carters, Superintendent Bryant of the Prudhomme mine has men at work and sinking is in progress.——At the Duffield mine drifting and stoping are in progress. Ore is being extracted and will be run through the Dreisam mill in the spring.——T. F. McAvoy, manager of the Hardtack mine, says he will start up the mine.

C. A. Lewis has bought the Mapes & Wetmore, the Oro Fino, the Grace, the Surprise quartz mines Nos. 1 and 2 and the Dollie Dimple quartz mine, near the head of Woods creek, on Bald mountain, near Sonora.

F. M. Mecartea et al. have bought the Bull Dog quartz mine and the Grand Pyrite claim at Big Oak Flat.

J. M. Merrill has bought the Cosmopolite claims Nos. 2, 3 and 4, near Groveland, and also a millsite.

The shaft at the McAlpine mine, near Big Oak Flat, has reached a depth of 250 feet and sinking will continue. An electric plant will be put in, says Superintendent S. E. Rigg.

COLORADO.

Boulder County.

The Poorman mine at Caribou has been bought by D. McKenzie at sheriff's sale and will be reopened.

Chaffee County.

The Calumet M. & L. Co. has been organized at Salida to develop claims on a 400-acre tract of land which has been worked for iron by the Colorado F. & I. Co. The tract contains gold claims. The officers of the company are N. H. Gherhart, Omaha, Neb., president, with J. M. Dickens, H. C. Mead and J. H. Gabriel. Their holdings are near Turret.

Clear Creek County.

C. A. Wimpfheimer of New York City, vice-president of the Sun and Moon M. & M. Co., operating at Idaho Springs, says sixty men are at work in the property and development work in the lower levels is to be increased next month. The upraise being extended from the Newhouse tunnel to the upper workings is progressing. It shows 8 feet of ore.

The Mica G. M. & M. Co., near Idaho Springs, is developing a mica-bearing dyke in connection with gold mining. The Starlight tunnel is being extended by contract to cut a number of gold-bearing veins. The dyke is said to carry mica deposits of commercial value.

The Big Five contral tunnel, near Idaho Springs, resumed operations last week, and the company is again driving the breast ahead. The tunnel is in 2536 feet. Driving operations were suspended Nov. 15th, on account of shortage of coal, due to strike in northern fields. At the Big

Five machine shops they are building a car, which is designed to work automatically, unloading at the end of the trestle by means of a derrick operated by compressed air. There is a double track from the tunnel over the trestle and bridge, one train to go out loaded, unload automatically and return on the other track. Fifteen of these cars will be built, each to have capacity of 54 cubic feet of rock.

The plant for the Gum Tree mine at Freeland is on the ground and being set up. It has capacity for sinking 1500 feet. The shaft is down 340 feet, and the first work will be to sink an additional 300 feet. After the additional 300 feet of depth is gained, it is intended to begin production, as well as to continue the work of sinking till a depth of 1500 feet is gained.

The fast drop stamps which were being operated on the west side of the Boneita mill, near Idaho Springs, for the Tauner & McNeil cyanide test have been replaced with slow drop stamps. The Boneita is now slow drop throughout, the only altogether slow drop amalgamating plaut in the district, says the Times.

The Wilkie mill, at Idaho Springs, has changed its hours of work, the shift beginning at noon and ending at midnight. The change has been made in order to secure better water power, Clear creek furnishing a greater supply of water at the hours mentioned than at any other time of day, says the Times.

Dolores County.

Lee, Miller et al. are now engaged getting the concentrating plant at the mouth of tho group tunnel ready to make a thirty-days' trial run on the stope dirt from the Enterprise and other veins in the United Rico M. Co.'s group, near Rico. They have men at work in the mine and mill and it is expected the plant will be running next week. If the trial run, with the use of steam, shows a profit, arrangements will be made to use water power, thus doing away with an expeuse of $25 per day.

At the Wellington mine, near Rico, a 30-inch body of high-grade lead and "sand" carbonates has been opened up, and the ore is being sacked and shipped. The Wellington group is being worked under lease by L. Habermann.

The Humphreys mill, Near Rico, started up last week with two shifts. The steam power plaut is completed and proves satisfactory, says the News. Moro men are being put to work in the mine.

Fremont County.

The Keystone Oil Co. of Florence will let a contract for drilling four wells on its grounds south of Florence. The daily production from the independent producers from this field is 600 barrels per day, and 300 barrels of this amount is produced by the Keystone Co.——The Blaney Oil & Gas Co., G. Johnston, manager, has its drilling outfit ready and will begin its first well Jan. 4th.

The independent oil operators and producers in the Florence field are reported arranging to build and operate an independent refinery. It will be located near Arkansas river. In the past all their production of crude oil has been sold to the United Oil Co. at rate of 84 cents a barrel. The price of crude oil has been advancing in the market and the independent operators demanded from the United Oil Co. 3 cents per gallon, or $1.26 per barrel, which was refused, and the producers propose to combine and erect a refinery.

Gilpin County.

The Nevada Con. G. M. & M. Co., operating in King flats in Nevada district, near Central City, is arranging for addition of a 100-ton plant to their mill on King flats. It will be equipped with Blake crusher, four Hartz jigs, two sets of rolls, two Huntington mills, five concentrating tables, together with separators, screens, pumps, elevators, etc. As the ores of the King, Lambertson, Warren, and other mines of this company carry as high as 20% of zinc, the company will put in an electric separator, and an electric plant will also be built for lighting the mine and milling plants. Regular developments have been resumed at the mines, says Manager Marx of Denver.

The East Boston mine, at Central City, has fifteen men at work, and the regular production amounts to 400 tons of milling ore per month, with a small percentage of smelting ore. It is owned and operated by Boston men; W. Joh, superintendent. They will resume sinking, the present depth of the shaft being 400 feet.

Gunnison County.

Operations have been started on the Boss group in the Box Canyon district, uear Pitkin, by J. T. Hanahan of Idaho Springs. This joins the Independent, Sunrise and Waunita Gold M. & M. Co.'s holdings. A 100-foot shaft will be sunk this winter, with drift run east. If this work proves satisfactory a trausportation and drainage tunnel will be driven in the spring.——The Golden Islet group of seven claims in the Gold belt, 4 miles west of Pitkin, is owned by R. T. Hefftner, who is increasing development. A 5-foot vein has been driven on for 200 feet in a 600-foot tunnel. Four and one-half feet of this ore is milling grade, the other 6 inches running 3 ounces in gold and 20% lead, says the Pitkin Miner. The ore is a sulphide and the milling grade averages $10 per ton. There are 1500 feet of workings. The walls are porphyry and granite.

Hinsdale County.

The Puzzle claim, near Lake City, was sold last week to J. T. Palmer.

Lake County.

S. Collins, president of the Collins Dev. Co., says he is arranging to resume work on the Hoffer shaft, in Big Evans gulch, and also on the Empire, on Long and Derry hill, near Leadville.

The additional battery of boilers at the Yak power house, near Leadville, are in use and full operations resumed. The addition consists of two 150 H. P. high pressure boilers. The Yak tunnel is 2 miles long aud opened and connected with shaft No. 4 Ibex. The company will continue development and other work and at same time will handle 3000 tons of ore a month.

Mineral County.

The Captive Inca mine of Creede is being developed and equipped. The three compartment shaft being sunk under contract is down 350 feet, with three shifts of men and machine. Improvements include an electric lighting system both on top and underground. Water for the plant is piped from a spring at an elevation of 250 feet. W. G. Boyle is manager.

The ore output of the mines of Creede for the year to December 1st is as follows:

Month.	Tons.
January	5,283
February	5,788
March	7,072
April	5,715
May	5,845
June	5,711
July	5,636
August	6,396
September	6,891
October	6,914
November	7,039

The output for December is estimated at 6000 tons, which will give a total tonnage for the year of 73,990 tons.

Ouray County.

The Camp Bird mine at Ouray is shut down on account of shortage of water for power, and preparations are being made to run a pipe line from the mill to the Revenue mine, and from there a sufficient head of water can be obtained.

San Juan County.

A total of 1500 feet of 22-inch pipe will be laid by the Gold Spur M. & M. Co. to convey the main stream of Cunningham gulch from a point near Neigold's town to where a tunnel has been started by the company, near Silverton. The fall is 40 feet, but the volume is sufficient to generate power for three drills, says the Standard. Manager T. Grabowsky will drive a tunnel at the base of King Solomon mountain (Cunningham gulch side), and continue for a distance of 1000 feet.

The Arpad M. Co., with a group of nineteen claims on the southern slope of King Solomon mountain, near Silverton, near the Black Prince and North Star mines, has arranged to have a 300-foot tunnel run to cut one of the principal veins of group.

The Domingo group, near Eureka, in Niagara gulch, is reported sold to the Con. Eureka M. & T. Co. for $50,000. The Domingo group consists of sixteen claims and two millsites, the latter adjoining the town of Eureka, the former being in Eureka basin. Equipment of machinery, comprising boilers, engines, drills, etc., will be placed. The company's holdings are said to be advantageously located for tunnel work, and the proposed tunnel at base of Crown mountain, below Niagara basin, will cut a majority of the veins at depth of 2000 to 2500 feet.

The Gold Spur M. & M. Co., says Manager T. Grabowsky, has started work on a 1000-foot tunnel, and he will also build a 1500-foot pipe line, erect a power house and put in machine drills. The Gold Spur mines are on the Cunningham slope of King Solomon mountain, near Howardsville.

W. L. Partridge, vice-president and manager of the Detroit & Colorado M. Co., says negotiations are under way for a group of claims owned by the Notaway Gold-Copper M. Co., consisting of twelve claims—the Champion group and the Thunder group of Silverton to develop the whole through one tunnel. These properties are grouped together on the east slope of Sultan mountain, and have a total of 4000 feet of development done.——The Ruby Basin M. & M. Co. has opened 30 inches of galena in the December lode that gives returns of 50% lead and nineteen ounces silver per ton. The tunnel, which is in 1140 feet, will be extended 300 feet farther, and it is expected in that distance will cut the Tornado vein. On the December lode, drifting both ways is in progress. T. V. Johnson and J. Bidwell of New York City are part owners.

The Robert Boner mine, a former producer, near Silverton, resumed operations under the management of W. D. Cole. The mine has 2000 feet in development. Work on the Congress mine, above Chattanooga, has been resumed.

Summit County.

W. F. Parker, manager of the Glacier Mountain M. & M. Co., near Montezuma, has men on developmeut work, and shipping ore is being taken out in opening the drifts.

Manager J. M. Thomas expects to operate the fourteen mining claims of the El Dorado G. M. & M. Co., near Breckenridge, next summer. A few men will, however, be kept at development work during the wiuter. The property is in the porphyry helt on which are the Jossie group with its 40-stamp and concentrating mill, and the Cashier group with its milling and concentrating plant.

In the Ten-Mile section, near Frisco, the Masontown M. & M. Co. has its 100-ton combination mill completed and is opening up bodies of milling ore, says Manager Keables. The Victoria vein averages 15 feet in width, with several streaks of smelting ore.——J. H. Myers and E. Chapin Gard are arranging to build a 100-ton pyritic smelter, near Frisco, on the Ten-Mile river.

The King Solomon tunnel, near Frisco, is being driven with three shifts. Work will be continued until the breast of the tunnel has entered Point Royal, a distance of 3000 feet, where it will gain depth of 2975 feet after having cut ten veins from 5 to 50 feet wide, says the Times.——Three miles above the King Solomon is the Wonderland property, embracing fourteen full lode claims and forty acres of placer ground in the valley of Ten-Mile creek. It is owned by a Pittsburg Co., who will develop it.——Opposite the Wonderland, on the northwestern side of the valley, the Money-Metal M. & T. Co. is increasing work. Its holdings include 400 acres of mineral land. They have bodies of ore in sight on the Lucky Boy and Golden Gate, and will build a concentrating mill next spring.

Teller County.

The El Paso Gold King mine, on Womac hill, near Cripple Creek, which has been closed down for several months, will resume operations in January. The property has been bothered with water, but the solution to the trouble seems to have been found in the El Paso drainage tunnel. It is being drained at rate of 15 feet per month. There was 80 feet of water in the shaft when work was stopped, but half of this amount has been drained off by the tunnel. The shaft is down 920 feet.

Superintendent E. Taylor expects to ship during the present mouth between 1600 and 1700 tons of ore from the Old Gold and C. K. & N. mines on Beacon Hill, Cripple Creek. Ore is averaging two ounces gold per ton. A station has been cut on the C. K. & N. at a depth of 498 feet, on the El Paso drainage tunnel level. If greater depth is attained it will he necessary to put in pumps. The vein at this depth has been cut 15 feet north of the shaft. There was shipped from the C. K. & N. during November 600 tons of ore, which gave returns of $50 in gold per ton. This ore was mined in a drift driven 320 feet toward the Old Gold line at a depth of 375 feet. The Old Gold produced 600 tons of ore during November, returning an average value of $36 in gold from the cross-vein, which has been exploited north and south for 225 feet. The crosscut was run from the shaft at a depth of 329 feet for 127 feet, where the crosss-vein was struck. Mr. Taylor is working two shifts each on the mines, the to al numbering seventy-five men.

The Tunnel M. & L. Co., operating under lease the Abe Lincoln, Lily, Granite Hill, Arcadia, May Queen aud Happy Boy claims in Poverty gulch, near Cripple Creek, resumed work on the Arcadia last week, which has been idle for three years. It is the only one of the group that cannot be worked through the Abe Lincoln shaft. Considerable work in the way of crosscutting and drifting is planned and work has started in a drift which was extended at a depth of 220 feet where they have an ore body already opeued up. They will mine and ship. The shaft on this mine has been sunk to a depth of 375 feet, and there is a plant of machinery with shaft and ore houses on the ground. The company is shipping smelting grade ore from the Abe Lincoln, where tho company is working thirty-eight meu in two shifts. Superintendent Swanson has sunk the shaft an additional 100 feet, giving it a total depth of 600 feet. A station has been cut and a crosscutting is under way to cut the Abe Lincoln ore shoot.

Manager C. C. Hamlin of the Granite mine, at Cripple Creek, says another ore shoot opened last month is improving as development progresses. The ore body was struck 750 feet south of the shaft at a depth of 1000 feet. It is 10 feet in width and returns from shipments give two ounces gold per ton. The company has twenty-five men at work on one shift. Next month this number will be increased and production will be doubled.——The American Eagles mine, owned by the Stratton estate, is closed down, owing to the eighteen-drill compressor being out of order, and parts of the machinery must be replaced. The lessees working the dump, however, are continuing operations. As soon as the machinery is in place the management will put on 100 men, divided into two shifts. The American Eagles shaft is down 1520 feet.

The military authorities at Cripple Creek have issued a statement that owing to the large number of idle men throughout the district, au order will be made next week that all those having no employment or visible means of support will be given the alternative of one of three things——either to go to work, leave the district or go to the bull pen for an indefinite term.

IDAHO.

Blaine County.

The Katherine group of claims, in Boulder Creek mining district near Ketchum, has been taken over on a three years' bond by J. O'Brian, W. Shakespeare, J. L. Brown and T. Schenck, of Salt Lake City, Utah, for $50,000, says the Deseret News. The mine had been opened up to show a ledge of ore 4 feet in thickness, 2½ feet of which was galena, from which shipments made averaged $40 per ton. It is intended by the Salt Lakers to begin development in the spring.

Boise County.

A. C. Gallupe, superintendent of the Golden Rod M. Co., owning the Mineral Hill group of claims near Placerville, says as a result of the clear weather a great deal of assessment work is being done in the district. On the Crown claim of the Golden Rod Co. a 4-foot body of ore which pans free gold has been opened up. It is intended to contiuue work all winter. The company is arranging to build a mill and have it in working order in the spring.

Canyon County.

R. W. Purdum of Nampa of tho Sunnyside mine says the crosscut running west is in 230 feet and the values show $7 per ton. Tbe ledge has been opened up 2200 feet to the north, with drifts and shafts. Machinery for a 40-stamp mill is on the ground. Thirty men are at work on the mine, working two shifts.

Idaho County.

The Idaho Con. C. M. Co. has taken over a group of copper properties on the Salmon river, 16 miles west of Grangeville, and has development work under way. The ore is said to carry silver values with the copper. Sbipments of ore will be made.

A. E. Borthwick of Roosevelt says, owiug to shortage of supplies in Thunder Mountain district and difficulty of packing iu, the prices of eatables compare with Alaska in early days. Flour is 14 cents per pound, bacon 35 cents, sugar 25 cents, butter 65 cents, fresh beef 25 cents, oatmeal 15 cents, potatoes 8 and 10 cents, salt 15 cents, coal oil $1.50 a gallon, syrup $1.50 per half gallon, and other necessities equally high. Competition, to make sure of delivery of goods, ran the price of packing in from 6 cents to 10 cents per pound. A large amount of all kinds of supplies and machinery are piled up on the incomplete State wagon road building into Thunder at the place of transfer from wagon to pack, ahout 55 miles south of Roosevelt. There will be no famine in breadstuffs, probably, for most of the companies operating there had early laid in full winter supplies.

At Roosevelt the Jumbo mine cleanup for month of November amounted to $11,500 in gold bulliou.

Kootenai County.

The St. Joe Basin Placer M. Co. has been incorporated by Pittsburg, Pa., men, including G. B. Legnard, J. T. Golden, J. E. Stevenson and L. H. Crick. W. A. Jones of Wallace, Shoshone county, is local agent of the company.

Lemhi County.

W. Anderson of Salmon City says within the next two years a railroad will be built to that point. The mining industry adjacent to Salmon is improving, and within a radius of 10 miles of Salmon City there are 200 men at work, with considerable development work in progress. At Leesburg the Gold Dust M. Co. has put its 10-stamp mill in operation. The mine is developed by a shaft 240 feet deep; the vein is 80 feet wide, carrying average value of $4 gold per ton. The Pope mine, operated by T. Pope & Son, is being worked under contract. The Haydee tunnol is being driven 900 feet and will cut the veiu at depth of 350 feet. The owners

expect to build reduction works in the spring.——Hill & McBride, who are working the Queen of the Hills mine, are also driving a tunnel 900 feet, by which they expect to open a vein at depth of 500 feet. On the Ramey mine, on Silver creek, development work is being done and the owners propose putting up a reduction plant next year. Soles Bros. & Rossier have also started up a mill on their mine. The Ulysses mine, on Indian creek, has added fifteen stamps to its milling capacity, the mill now having thirty stamps. ——Reports from Owl Creek district say the Yellow Jacket mine, 60 miles from Salmon City, is in operation: T. B. Giles is superintendent.

R. M. Edwards of Houghton, Mich., president of the Kittie Burton G. M. Co. at Ulysses, says thirty stamps are dropping in the mill. The mine has been producing an average of $9000 per month for the past eighteen months with fifteen stamps.

The Gold Dust M. Co., near Salmon City, shut down last week for sixty days to do development work.——A strike is reported made at the Italian mine in the bottom of the shaft being sunk. A 4-foot ledge was cut, assaying $50 per ton.—— The Wright & Edwards coal mine is in full operation and delivering lignite coal.

Shoshone County.

Freight rates on galena ore from the Cœur d'Alenes to the smelters at Denver and Pueblo, Colo., were cut $2 per ton last week, says the Spokesman-Review. The rate applying to ores valued at not over $60 per ton is reduced from $10 to $8 per ton in carload lots of not less than 30,000 pounds. The bulk of Cœur d'Alene ores is between the valuations named. The previous rates have been $8 on ores of a value not to exceed $50, $10 where the value did not exceed $65 and $12 where the value did not not exceed $100 per ton. The new rates are effective from Spokane, Wash., Wardner, Osburn, Wallace, Gem, Frisco, Burke and Mullan, Idaho. The roads making the rates are the O. R. & N., Oregon Short Line, Colorado Midland, Denver & Rio Grande, Atchison, Topeka & Santa Fe and Colorado Southern. Later the Northern Pacific also announced it would make the same schedule of rates, its rates being in connection with the Burlington, Oregon Short Line, Union Pacific, Rio Grande Western, Denver & Rio Grande, Colorado Midland, Colorado & Southern and Santa Fe lines. There is no change announced in the existing ore rates from the Cœur d'Alenes to the smelters at Tacoma and Everett, Wash. These, as shown by the Northern Pacific tariffs, are: On $50 ore, $5; on $65 ore, $6, and on $100 ore, $7.50. The existing rates from Northport, Rossland, Nelson, Kaslo and Sandon to Pueblo and Denver are $10 on zinc ore and $12 on lead ore. All these rates are based on carload lots, minimum 30,000 pounds.

The A. D. M. & B. & T. M. Co. has been incorporated at Wallace by H. G. Brown, H. Billberg, J. Thennis, A. D. Monroe and J. H. Nordquist.

J. M. Porter, civil engineer for the Bunker Hill and Sullivan M. & Concentrating Co. at Wardner, says the Kellogg tunnel, 2 miles in length, gives a maximum depth of 3000 feet on the dip of the lode, and the ore shoot has been exposed for length of 1400 feet on the new deep levels. The lode dips at 45° and holds its width of 250 or 300 feet. Manager S. Easton has 400 men at work and is shipping 100 tons daily of concentrates.

The Gold Hunter mine, near Wallace, has been closed down indefinitely. No explanation was offered. About sixty men have been employed at the mine and 250 tons of concentrates have been shipped per month during the past year.

The tunnel being driven at the Morning mine at Mullan will give vertical depth of 2500 feet when completed and will open 1000 feet of new ground, says T. Greenough, managing partner of Larson & Greenough's mining interests. The tunnel has been under way for three years. It is 6x8 feet in the clear, and is in 6000 feet. It will be driven a total of 10,000 feet, and is expected to take two years more to catch the lead. It will cut the vein at 1000 feet below No. 5 tunnel, which is now the lowest adit on the vein. They have started a 1000-foot winze from the No. 5 level to connect with the No. 6 tunnel, when it shall be completed. The winze is down 200 feet, and they are drifting both ways on the vein at the station. The vein is nearly vertical, but they are sinking the winze vertically, regardless of the lode. The Morning is milling 700 to 800 tons of ore a day, and is shipping 100 to 125 tons of concentrates daily. They have completed the additional vanner house and put in eight Frue vanners and a table concentrator.

KANSAS.

Cherokee County.

At the Goodwin-Wagnor shaft on the Gaines - Brewster lease, near Baxter Springs, additional machinery has been put in, including an 8-inch pump and a 40 H. P. boiler. Some water is coming in. The ore in this shaft shows a large amount of lead with the jack.——The north shaft at the Tom Clark mine is being sunk deeper and lead ore is being taken out.

Dillonway & Co., at the Sunny Side mine near Baxter Springs, will build a mill. They have prospected their mine by drilling and drifting.

Crawford County.

The Chapman Coal M. Co. properties are reported sold for $100,000. F. B. Chapman and S. L. Quinn, of Columbus, O., were owners of the Chapman Co.

MICHIGAN.

Lake shipments of copper by water during the thirty-two weeks of navigation the past season amounted to 87,684 tons of refined, as compared with 87,055 tons during the season of 1902, says the News.

Keweenaw County.

The compressor house at the Mohawk mill, near Allouez, is enclosed, and the machinery is being set up.

Ontonagon County.

The mill of the Mass mine, at Mass City, is only running one head on Mass rock and one on Michigan rock, shutting down at night. The Mass is said to be more than making expenses.

MISSOURI.

Jasper County.

The American Lead & Zinc Smelting Co. has bought the Richmond mines on the McGregor land, east of the road between Carterville and Prosperity, paying $15,000.

E. H. & C. D. Pratt have organized the Missouri Reduction Works in Joplin.—— The Feller Bros. are operating a prospecting drill for mineral on their land, 3 miles northeast of Carthage.

Lawrence County.

At Stotts City G. Davis et al., of the Katy mine, are drifting at the 85-foot level. At 10 feet from the shaft they have opened up zinc ore.——At the Illini the men caught up the broken ground and have the shaft in good condition. They have also repaired the mill.

The McFarlane mine at Stotts City is running steadily and getting out high-grade ore. Hatton & Haw are running the pumps at the C. C. C. and will start the mill next week, as they have ore in sight.——T. S. Waddell, of the Keystone mine, has been running his mine steadily. ——N. B. Larkin, of the Small Hope mine, has had the shaft sunk 20 feet deeper. The ground shows up well. They expect to sink another 20 feet before drifting. They are putting in a lift pump to take the place of the small steam pump heretofore used.

The building of the plant at Lucky Jack No. 2 mine, near Stotts City, is progressing, the framework going up. Most of the machinery is on the ground.—— Robertson & Davis, who have a lease on land adjoining the Boston Boy, will operate a prospecting drill.

Wright County.

Mining operations around Mansfield are reported increasing. The immediate cause is the strike of lead and zinc made in the Red Bird mine, 4 miles northwest of that city. The mine was put down to depth of 90 feet, following a fissure carrying mineral. The operators have run a drift along the fissure for 100 feet and a crosscut for 50 feet at right angles to the fissure, all said to be in ore. In this work 200 tons were taken out and a mill will be put up to clean this ore. In digging for water with which to run the mill another body of mineral was found some distance from the shaft and at 17 feet down.

MONTANA.

Receipts at the United States assay office for month of November were $202,222, of which $151,063 was from Montana. Only $1108 was in silver, the remainder being in gold. The figures afford only a partial estimate of the production of the State, as a portion of it finds its way to other assay offices, while the mines of Butte have no dealings with the government direct, their product being treated at their own smelters and shipped East.

Carbon County.

T. Cruse of Helena has bought nine oil placer claims in Carbon county, in addition to his previous holdings in same section, and the whole will be operated next season.

The Black Diamond Coal Co., H. Smith of Duluth, Minn., manager, has bought the McCarthy coal mines at Fromberg and will increase development work. W. Hymer of Red Lodge is preparing to develop the coal fields adjoining Red Lodge.

Deer Lodge County.

A. Curry, H. McElroy and J. McManus have located the Independence quartz claim on Foster creek, and J. A. McMasters has located the Lark claim on Warm Springs creek, near Anaconda. The Independence adjoins the Caledonian and all are near the headwaters of Foster and Warm Springs creeks.— G.B. English has bought the Caledonian and Anna Maud claims, also the Morning Star claim on Warm Springs creek, and the group will be developed by the Chicago-Montana G. M. & M. Co. with the Lark and Highland Chief claims and an accompanying water right.

W. J. White, owner of the Gold Coin mine, near Anaconda, carrying free milling gold ore, has bought the Midnight Bell claim adjoining the Gold Coin.

Fergus County.

E. H. Crabtree, secretary of the Case-Wilson Cyanide Dev. Co., says they are preparing to work its recently bonded properties in Tilden gulch, in the Cone Butte district, near Lewiston. Buildings have been put up, and development work on the mines will be done during the winter.

Jefferson County.

Work is progressing on the Jay Gould group, near Basin. The 20-stamp mill is going up, and it is expected to be in operation by January 1st.

The South Bend M. Co., whose claims adjoin the Peerless Jennie mines in the Onturio district, is doing extensive development work, says the Basin Progress. They are running a 500-foot tunnel, which is in 200 feet, and which will give a depth of 250 feet below the upper tunnel. In the upper tunnel they have struck a vein of ore which runs 50 ounces silver and $16 in gold a ton. The company has leased its Uncle Tom mine to Eastern men who will develop it.

Lewis and Clarke County.

The Red Bird M. Co., operating near Austin, 20 miles from Helena, is making regular weekly shipments, the ore running well in copper and gold. Work has begun on a 600-foot two-compartment shaft, the present workings being in an incline 400 feet long. Men have also been put to work on the Gold Hill mine, owned by the company, and it is expected shipments will begin next month.

Work is progressing on the Jay Gould properties near Helena, and it is expected the stamp mill will be ready by Jan. 1.

The Cook G. M. Co. has been organized by St. Paul and Duluth, Minn., men to operate the Fortune group, 5 miles west of Helena.

Madison County.

The Dakotah M. Co. is operating near the mouth of Hungry hollow, near Virginia City, under the management of T. G. Port, who is working thirteen men.

O. Borgstrom, of Butte, has bought the Galena mine for $7000 cash. The Galena is in Silver Star district and is under lease to G. B. Wyant for eighteen months, two months of which have expired. The Galena ore carries gold, silver and lead. The mine is developed by tunnels and a shaft 100 feet deep. While sinking the shaft another shoot of ore a foot wide has been cut, and a carload of ore shipped from it Dec. 1st netted $2000.

The Black Hawk M. Co. has been incorporated by A. C. Mason, president of the Big Indian Co. of Helena, with Eastern men, to operate seven claims near Norris. —— The Moline G. M. Co. has been incorporated to operate near Virginia City.

Silver Bow County.

At the Sailor's Dream mine, 14 miles northwest of Butte, owned by the Homestake G. M. Co., development is going ahead, says Manager P. Kendrick. On the dump are 200 tons of ore coming from development only. They are blocking out the ore in the mine, and in the spring it is intended to build a mill. There is but a small mill at the mine. It has not been operated for several months.

The Pittsburg-Montana M. Co., working the iron mines near Elkhorn, Jefferson county, has thirty men employed and expects to blow in its smelter, near Butte, next week.

NEVADA.

Esmeralda County.

Superintendent Minard, for Van Duzer, has a bond on the Silver Star mines, near Hawthorne, and has men at work on the group.——The showing in the Bounce on the 400-foot level is reported satisfactory.

H. C. Brougher and E. L. Mims last week bought a group of seven claims adjoining the Blue Bull mine on the east at Goldfield, south of Tonopah. A shaft shows a ledge carrying free gold. Men will be put to work for development.

Nye County.

At Hannapah, Superintendent F. B Work of the Hannapah mine, reports work pregressing. The west drift on the 250-foot level has reached a distance of 260 feet from the shaft, at which point a crosscut has been started north. Stringers of quartz have been cut. The north crosscut from the 250-foot station is out 58 feet. Some water is coming in.

Washoe County.

The Springfield - Nevada M. Co. at Olinghouse is blocking out ore in the Cabin No. 2 mine. Mill No. 2 is on an eight-hour run at full capacity and mill No. 1 was put in operation this week. The prospecting drill is down 80 feet and has not struck rock sufficiently hard to permit of core being saved, except in one instance, where a few feet of the andesite was drilled through.

The Butte and Gold Center mines at Olinghouse are blocked for ore storage and are working all their men on the stamp mill, which will be in running order next week. The mill has three stamps, quadruple discharge 1000-pound stamps, the power being a 20 H. P. steam engine, with boiler equipped for using crude oil for fuel. Blake crushers will be used.—— The Golden Eagle mine at Olinghouse has been leased to W. Brandon.

Reno reports say L. T. Brockbank of Salt Lake City, Utah, who has a lease and bond on the Monarch and Zinn mines in Pine Nut district, covering 1800 acres, is increasing development work. More men will be put on.

White Pine County.

Q. Nebeker of Salt Lake City, Utah, has taken hold of gold-bearing prospects at Osceola, and will develop them.

NEW MEXICO.

The annual report of Governor Otero for the year 1902 shows the aggregate production of gold, silver, copper and lead, was of value of $1,489,016, the output being distributed as follows: Grant county, 55,110 short tons; Socorro, 23,734; Lincoln, 23,500; Bernalillo, 9194; Sierra, 5824; San Miguel, 4375; Santa Fe, 2960; Otero, 1960; Luna, $1955; Taos, $1963; Colfax, 1353; Rio Arriba, 750: Dona Ana, 415; Mora, 250; Valencia, 10. The total for the Territory is 133,353 short tons, of which 77,173 tons were sold or treated.

The gold production was $254,205 from lode mines and $130,480 from placer mines. The gold production from lode mines, by counties, was as follows: Grant, $78,710; Lincoln, $50,607; Bernalillo, $44,182; Socorro, $42,056; Sierra, $21,705; Santa Fe, $6341; Colfax, $3552; Dona Ana, $3400; Otero, $3200; Rio Arriba, $42. From placer mines: Colfax, $117,680; Sierra, $5950; Grant, $3665; Santa Fe, $2145; Lincoln, $550; Otero, $275; Rio Arriba, $115; Taos, $100.

Silver was produced as follows: Socorro, $75,078; Grant, $25,125; Bernalillo, $19,746; Sierra, $13,096; Lincoln, $6009; Luna, $5416; Rio Arriba, $3030; Santa Fe, $945; Dona Ana, $100; Otero, $76; Colfax, $38; a total of $148,659.——Copper production: Grant, $793,028: Socorro, $48,636; Otero, $11,732; Sierra, $5728; Rio Arriba, $798; Santa Fe, $390; San Miguel, $315; Bernalillo, $110; a total of $860,737. ——Lead production was: Socorro, $43,489; Luna, $28,275; Grant, $18,162; Sierra, $3315; Santa Fe, $1294: Dona Ana, $400.

The report further says that by comparing with the previous year the heavy falling off in output of the precious metals occurs in Bernalillo, Santa Fe and Socorro counties. The cause of this in Bernalillo county is due to closing down of the Albemarle mine; in Santa Fe county to suspension of work of Santa Fe G. & C. Co., at San Pedro; and in Socorro county to shutting down the Rosedalo mine. These properties when in operation produced two-thirds of the gold of the Territory. An increase is noticeable in Colfax, Dona Ana, Grant, Sierra and Rio Arriba counties. The largest gain is in Colfax county, due to output of the dredge of the Ore Dredging Co., which produced 28.2% of all the gold in New Mexico for 1902.

In most of the camps in the Territory improvements are either completed or under way, and the output for 1903 will show decided increase. While the mining of the precious metals, including copper, lead, etc., will add materially to the prosperity of the Territory, the principal mineral wealth of New Mexico is in the extensive deposits of coal and iron.

Grant County.

The Colorado Fuel & Iron Co., owing to the coal strike in Colorado, has closed down operations at Fierro, 150 men who are usually employed in digging iron ore from the Union Hill and surrounding properties being laid off, says the New Mexican.

Ten cars of high-grade ore are being shipped per month from the Monument Key mine at Pines Altos by W. C. Chandler. He has twenty-five men developing the mine and taking out ore. This number will be increased to fifty men next month. In the last six months 400 feet of drifting on the 700-foot level has shown the vein of ore to be continuous, the cop-

per, silver aud iron being equal in value to the gold it contains.

Another 40-ton furnace will he added to the plant of the Shamrock Co. at Pinos Altos. The Shamrock mine, however, is closed at present owing to the inability of the compauy to securo a sufficieut aud steady supply of coke. Tho company is omploying sixteen men on developmeut work and tho Silver Cill will be sunk 200 feet deeper and a shaft sunk on the Keystone.

Development work is being increased by the Santa Rita M. Co. at Santa Rita. The principal operations consist of work in the 150-foot level of No. 7 shaft, from which ore is being taken, and also ou the 300-foot level of the Hearst shaft. Work is hoing dono in seven drifts. The concentrating plant was run for fifteeu days in November and the same average will ho maintained in December. About seventy men are employed.

A strike is reported on the Romero lease at Santa Rita, owned hy M. Islos and W. H. Ernest. Seven cars of ore are being shipped from this lease per month, which runs 20% copper.——The shipmonts from Santa Rita during November aggrogated forty cars. The output for Docember will be at least as much.

Rio Arriba County.

Machinery has been set up on the Jawbone mine, near Hopewoll, Bromide district. The shaft is timbered down to the 60-foot level and the timbering is being continued to the 108-foot level. A pump will be placed on that level and from thore a drift started west to cut the ore body. Drifting is heiug done on tho 60-foot level to show the width of tho ore. Work has been resumed on the Red Fissure, in Bromide district, after a shutdown of several weeks.

San Miguel County.

The Matt reduction mill at Las Vegas is heing overhauled and remodeled.

Sierra County.

McDonald Bros. are workiug their mines on Poverty gulch above Philipsburg, having put in a steam pump to control the water, says the New Mexican.——The Minnehaha mill, near Fairview, is operated occasionally. A number of meu are working in the stopes taking out ore.——Q. Vance says he has reached the limit of developmeut on the Christopher Columbus mine with his whim and has oro to the bottom. The whim will he movod to the Readjuster mine.——T. Scales is working a few men ou tho Confidonce group, also on the Dictator mine.

OREGON.

Baker County.

Managor Vinson of the Emma miue, near Baker City, says further development will be done. To tap the vein below the present workings, a tunnel 2000 feet in length will he run. As the buildings are not large enough to accommodate two sets of men, those working at the upper workings and those at the mill will ho laid off temporarily. The tuunel will be operated with twelve men. The management havo decided to huild a 20-stamp mill at the mouth of tho new tunnel next summer.

On North Pole divide, near Sumpter, the Platts group, joining the Orogon Clipper on tho south, and extending into the Rock creek hasin, has been takeu ovor hy the Geiser-Hendryx Co. Development work continues. The group consists of ten claims, sevon of which are end-on, covering a lode striking down the Rock creek basin from the North and the South Pole groups.

It is stated that the Sumpter smelter, at Sumptor, will hlow in Jan. 1st.

Douglas County.

The Oregou Securities Co. is finishing its 30-stamp mill and 500 H. P. electric plant at Bohemia. The wagon road up Champion canyon and the pole line have heou fully repaired in places, where damaged hy the storm last month, and the tramway and snowsheds from the mill up the mountain to the mouth of the tunnel and ovor tho saddles are nearing completion.

Grant County.

The Black Butto M. Co. has been organizod and has taken over tho Black Butte group in Fox valley, near Fox. Thore are tweuty-five full claims in the group, nine of which are patented. There are two mills on the group, buildings, and the lodo is opened hy adits and a wiuze sunk below this level. The officers of the company are: F. W. Viucend, Pendleton, Or., president, with T. C. Taylor, O. C. Wright, G. H. Wheeler and C. B. Wade. E. C. Allen of Portland is superintoudeut. The main lode is 100 feet wide, with a pay shoot 20 feet wide. A hoist will bo put in in tho spring, as soon as hauling is practicable, with a depth capacity of 500 feet. Drifting on the lode will he started next week. The shaft will he sunk where the winze is located.

E. Simpson, developing the Monitor group, near Susanville, is putting in a Huntington mill. With the mill is a 15 H. P. steam plant. The vein has been opened by a 70-foot crosscut, from which drifts are being made in both directions on the voin. The Huntington mill is of 5 feet diameter.

Jackson County.

The Bill Nye mino, on Galls creek, ¾ of a mile from the Golden Standard mine, near Jacksonville, under Manager Andrews of Medford, has nearly completed a 5-stamp mill and expects to begin milliug ore by Feb. 1st. Machinery has been put in of capacity to sink a 500-foot shaft; also drill and compressor.——The Purkeypile mine, also on Galls creek, has been bonded and eight mou under Foreman W. S. Clark are driving a tunnel. The ore from this mine has been hauled to Gold Hill, heretofore, hy way of Foots Creek, but a 5-stamp mill will be put in at the mine.

Josephine County.

The Sturgis hydraulic placer miues of Forest Creek district, near Graut's Pass, have heen bougbt hy S. A. Vance of Los Angeles, Cal., and $25,000 paid down. Vance will enlarge the plant and shape it for work on a more extensive scale. The property consists of 1400 acres. There are three ditches and water rights, affording a long run each season. He is having the Sturgis overhauled and re-equipped under superintendence of W. R. Olmstead. Two giants will he operated. An electric lightiug plant and telephoue system will be put in and a hydraulic elovator set up to handle the tailings.

SOUTH DAKOTA.

According to the annual report of tbe State Mine Inspector, T. Gregory, the gold production of the Black Hills for the twelve months ending Dec. 1st was $7,159,400.70. The report notes a generally prosperous condition of the mining industry of the State. Strike conditions in other States havo in some instances served to retard developments, one heing the strike among the coal and iron workers, making it difficult for the mines of South Dakota engaged in the building of mills and plants to obtain material. Under the head of labor, Gregory says harmony hetween employer and employed in the mines of South Dakota has prevailed throughout the State, the one exception heing at the smelter of tho Golden Reward M. Co. in Deadwood, in compelling the plant to close down. Other conditions, iucluding litigation, have combined to keep the plant idle, although most of the company's mines have been in operation and part of their ores treated at the company's cyanide plant in Deadwood and the remainder shipped to outside smelters. The miners and mine laborers of South Dakota are paid $3.50 per day for miners, $3 for shovelers and from $2.50 to $4 per day for mill aud other laborers. Generally ten hours' work constitutes a day, though on some work three shifts of eight hours each are employed. Under the head of new reduction plants the following have heeu completed: Horsesboe, Hidden Fortune, Penobscot, Jupiter and Golden Crest, having a combined daily tonnage of 1200 tons. The Homestake has continued as the chief producer of the Black Hills, making material increase in its production for 1903 over 1902. There has been a large amount of "dead work" done in the Black Hills during the year.

TENNESSEE.

Polk County.

The Tennessee C. Co., which is controlled by the same interests as the Santa Fe G. & C. Co., operating at San Pedro, southern Santa Fe county, N. Mex., is producing 100,000 pounds of copper monthly at its mines and smelter at Ducktown. It is laid dowu in New York at a cost of 8½ cents a pouud. The company has heen experimenting with the pyritic process of smelting and has equipped one of its three furuaces for this method. The company proposes changing its remaining furnaces and putting in a fourth. The company is said to he in position to produce during the coming year 18,000,000 pounds of copper. The mines have reached depth of 400 feet.

UTAH.

Beaver County.

The Majestic smelter, at Milford, has closed down. It has not heen intended to keep the plant in continuous operation as yet, it heing realized that this would be impossible with the limited development of the mines, says the Milford Times. The Old Hickory is relied on for the hulk of the tonnage, and the shaft at this property is hut 200 feet deep, while most of the ore that has heen treated has been stoped from above the 100-foot level. The smelter could be supplied with ore for some weeks yet, but the stock of coke on hand is short. Superintendent Kelly reports that since Dec. 1 the plant has treated an average of 206 tons of ore daily under the cold blast. The matte output has heen eighteen tons daily, of an average value of $115 per ton. The plans are to concentrate all work on development of the mines. Work will be resumed this week on the shafts at the Old Hickory, O. K. and Harrington-Hickory, which will ho sent down below water level with threo shifts each. It is intended to use electric drills in the Old Hickory and O. K. shafts. It is expected to he six months at least hefore developments have reached such a stage as to justify resumption hy the smelter. The Salt Lake offices of the Majestic C. Co. will he closed Jan. 1, to concentrate the mauagement at Milford.

Tho Newhouse pipe line is delivering water on the Newhouse townsite, near Frisco, at rate of 2,000,000 gallons every twenty-four hours. Work on the reservoir at the townsite end of the line is under way. This will be cement lined and will have a capacity of 450,000 gallons. It is expected work of construction on the concentrator and other buildings will he started February 1st. Tho water is piped through a 14-inch pipe from the west side of Wah Wah valley to the east side, a distance of 9 milos. The original cost of the springs was $70,000, and the total cost of the system is expected to be $200,000.

At the Blue Acro miue, near Milford, Manager Crowther reports progress on the main shaft, which is cutting a body of copper ore. It is intended to begin drifting as soon as the 400-foot level is reached.

Grand County.

Machinery for the John Clark mill in the La Sals, uear Basin, is on the ground and heing set up. Tho mill will he used on ores of the Gold Basin mine, and the cyaniding plant is of 100 tons daily capacity. The ledge devoloped is 60 feet in width which is said to average $7 per ton. Manager Clark says, besides the mill, a saw mill will bo taken in in tbe spring.

Iron County.

Operations will be resumed at the Ophir mine at Stateline, says Manager Schwartz, who has been ovorhauling the machinery. At first only development work will be done underground, as it will take considerable ore to koop the mill running.

Juab County.

The Grand Central dump of second-class ore at Euroka, which contained 60,000 tons, has been cleaned up and the future tonnage will come from the mine. The ore is said to have netted the company $5 a ton.

The May Day mine, near Eureka, is reported improving. The output of ore and concentrates is increasing. The rock heing marketed is of silver-lead values and brings $800 a car. The ore hody on the 200 foot level has increased in size and value. A new strike is also reported 30 feet below the 100-foot level.

The Minnie-Argontine mine, in the east end of Tintic district, near Eureka, will resume operations. This group is near the Uncle Sam mine.

The Bingham Con. C. & G. M. Co. last week bought the McChrystal estate interests in tbe Eagle & Blue Bell mine at Eureka for a cash consideration, says the Tintic Miner, and will start permanent development work, expecting to have the mine in conditio.i for handling 100 tons a day hy July 1. Manager D. McVichie says, whether the old shaft will he deepened, or a new shaft sunk at a point nearer the ore hodies from the tunnel level, has not yet heen decidod on. It is not intended to stope extensively until the new shaft has reached the ore deposits already opened from the 550-foot level to the 750-foot. The Bingham company has heen handling the mine for the past year under an option. It is near the Grand Central, Centennial Eureka and Eureka Hill.

The stoping of low-grade ores in the Swansea mine at Eureka has heen discontinued indefiuitely, the Majestic smelter, to which the product was shipped, having closed down.

Morgan County.

The New & Great Western M., S. & D. Co., which bought the properties of the Bazouk M. Co. at Bingham, and the Carbonate Gem of Morgan county, is preparing to resume work on the latter group of claims. The mine is equipped with machinery. A patent has been applied for for each of the nine claims. Work on its Bingham property—the Bazouk—is progressing.

Piute County.

The Leo Vernon M. Co. has heen incorporated at Marysvale, to develop a group of seven lode claims in the Ohio mining district, by J. F. Gihbs, J. E. Peterson, J. D. Gihbs and S. L. Page.

The Shamrock Kimherley G. M. Co. has been incorporated hy D. S. Dorrity of Kimherley, president, with M. N. Ross, G. Lewis, M. Sommer, J. C. Cbristianson, C. W. Watts and A. Paxton, Sr., as officers and directors. The company owns a group of seven mining claims (formerly the Hayseed Shamrock) in Gold Mountaiu mining district, near Kimhorley. The principal place of husiness is Richfiold. This property adjoins the Trapper's Prido on the north and the Advocate group of mines on the south, and is ou the Fish creek slope. There are three tunnels, in one of which is a 4-foot vein, assaying $5 in gold and five ounces in silver on the face, says the News. This tunnel is in 350 feet. Another tunnel, which is in 170 feet, shows gold-bearing rock. The Sevier ledge is said to run through this group. Men will be put on this week.

Salt Lake County.

The Rob Roy M. Co. has heen organized at Salt Lake City to develop four lode mining claims in the West Mountain mining district, Salt Lake and Tooele counties. E. Rauch, A. McKollar Jr. and E. McGurrin are officers.

Summit County.

At tho Daly-West mine at Park City sinking has been resumed in the shaft. It is intended to put it down to the 1700-foot level from the 1400 level.

The forwarding of conceutrates from the Kearns-Keith mill at Park City to the sampler hegau last week, says President Kearns.

Tooele County.

The station on the 700-foot level of the Stocktou mine of Stockton is completed and the drills started hoth east and west from the shaft, says Manager Trenam.

The slimes cyaniding plant of the Con. Mercur mino at Mercur is in full operation and haudling the entire output of the mine, amouuting to 800 tons daily, says President Dern.

WASHINGTON.

Ferry County.

Lignite coal is reported found at Republic hy T. Connor.

Okanogan County.

The Palmer Mountain G. M. & T. Co. is huilding a compressor plant at its mine near Loomis. Its construction will he followed by an electric power plant on Toat's Coula creek, a mile across tho valley from the mine. The power plant is preliminary to the further development of the property and eroction of an ore treatmeut plant.——The owners of the Pinnacle mino havo broken into au ore hody. Tho ditch leading to and tbe cam shaft of tho Black Bear mill, which is leased hy the Pinnacle Co., have been ropaired and the stamps are droppiug again after a shutdown of soveral weeks.

The Ruhy Hill mine at Loop Loop has heen closod for the winter, says S. M. Dudley of Portland, Or., superintendent.

H. A. Wilder has a contract to extend the tunnel of tho Northland G. & C. M. Co.'s property on Douglas mountain, near Conconully, 200 feet. The tunnel is 800 feet long and is expected to crosscut the first lead within the next 100 feet. The mine is owned hy F. S. Dement of Walla Walla.——Tho Mineral Hill miue has received several tbousand feet of air piping to provide hetter ventillation for the mine. Faus have been put in. A compressor plant is on the ground and as soon as it is set up a douhle shift of men will he put on tbe main tunnel with machino drills.

Superintendent H. Thompson, of the Interstate M. Co., reports a strike of copper-gold ore in the Koystone tunnel on tbe Crystal Butte mine, near Chesaw. The Koystone tunnel was started Sept. 1st and is in 105 feet. It is being drivon to cut a ledge at 225 feot which shows on the surface. The ore struck last week is a hlind vein.

Snohomish County.

At Silverton work is progressing in several of the mines. There is plenty of timber and water power, says the Record, with tide water near. The camp also has railroad facilities. The Bouanza Queen mine, owned by Minneapolis, Minn., men, is arranging for equipment with a reduction plant.

Stevens County.

The Hibernian G. M. Co. has heen incorporated at Spokane by H. S. Martin, C. C. Culliton and A. E. Gallagher. Tho company's property consists of the Abo Lincoln and the Bryan claims, near the Forry county line. It is a gold-bearing quartz proposition.

J. B. Tuttle, superintendeut of the King mine at Onyx, near Valley, roports more ore opened on the 350-foot level, giving 12 feet width. The ore is hlack sulphide of coppor.——Diamond drill machinery is on the ground for the Iron Hill mine.

Whatcom County.

The Red Mountain G. M. Co., in Mount Baker district, is increasing work on its free milling property. A crosscut tunnel is heing driven 130 feet below the upper workings and when completed drifting and stoping will be started. The company will build a stamp mill. The group

is on Red mountain.——The Great Excelsior mine is expected to turn out more concentrates this winter, owing to addition of more concentrators, slimers and a rolling mill. All are in operation.

The Post-Lambert 10-stamp mill, in Mount Baker district, east of Whatcom, will continue operations during the winter, and in the spring the capacity will be doubled. It is also expected a cyanide plant will be put in to treat the tailings, which assay $3 per ton. The ore carries values of $35 per ton.

WYOMING.

Albany County.

At the Coldwater's Wolverine mine, near Pearl, Colo., south of Laramie, J. Montague, superintendent, says the crosscut from the shaft at depth of 125 feet has cut the ore body for 6 feet, showing a shoot of sulphide ore.

Carbon County.

The owners of the Cumberland copper mine, 8 miles east of Saratoga, have, after a year of idleness, again begun work there. A tunnel 900 feet in length had been run to cut the vein. Not striking the vein at the point calculated, the work was abandoned for a time.

Crook County.

Operations in the oil fields of Moorcroft are being increased. The Butte Crude Petroleum Co., composed of Butte, Mont., men, which owns a large area of ground, has been working steadily since Nov. 1, while the Monumental Co., in which Butte men are also interested, has been drilling since Sept. 10. E. Hickey and J. M. Stewart are part owners and have a well down 800 to 900 feet.——B. Calkins reports having a prospect from which the seepage averages two barrels per day. None of the wells at Moorcroft are through the red sandstone.

Fremont County.

At Lander forty wells have been sunk below the red sandstone, and it was beneath this stone that oil was struck.

FOREIGN.

AFRICA.

Congo State.

The annual report of the Katanga M. Co., of which H. Pasteur of London, Eng., is a director, shows that, according to the exploration works already completed, the mining region of Katanga comprises four groups of deposits: 1. The east or Katanga group. 2. The Kambove group. 3. The Pala group. 4. The Kazemba group, on the left bank of the Upper Lualaba river. Most of the copper ore contains gold, but if the results of the investigations and analyses made are maintained, the gold in the Katanga copper ores will be too insignificant to be taken into account in working for copper. Mining exploration is being carried out to the west of the Lualaba.

Transvaal.

The Jupiter Gold Co., under date of December 3, reports at a depth of 3907 feet in the crosscut from the Catlin shaft from which a drillhole was sunk, the south reef was struck at depth of 90 feet, showing a width of 4 inches, assaying 17 ozs. 8 dwts. per ton, and 2 feet 4 inches assaying 9 dwts. per ton. Further reefs were struck in the hole at 117 feet a width of 6 feet, and at 129 feet a width of 5 feet 2 inches, the assay values being poor. Boring is being continued, and it is estimated the south reef will be struck in the shaft at a depth of 4150 feet.

The figures for production of gold on the Rand for month of November give the output at 279,813 ounces, compared with 284,544 ounces in October, and 187,375 in November, 1902.

The Robinson Central Deep mine at Johannesburg on Nov. 17 reports: The leader has been found below the south reef: the total width of south reef, the leader and the intervening quartzite, where met with in the shaft, is 5 feet 9 inches, showing assay value of 3 ozs. 7 dwts.——The Simmer & Jack West Co., Nov. 19, says in Howard shaft, at end of crosscut driven 90 feet north from the 3400-feet level, put down diamond drill hole, which cut reef at distance of 100 feet, showing 41 inches wide, of which 2 feet assays 12½ dwts per ton. Another reef, struck at depth of 142 feet, is 8 inches wide.

AUSTRALIA.

The Australian gold yield for the first nine months of this year, according to the Australian Mining Standard, shows an increase. The figures (in fine ounces) for the different States are:

	For 9 mos. 1902.	For 9 mos. 1903.	Increase.
Western Australia	1,371,500	1,561,352	189,852
Victoria	523,007	547,509	24,502
Queensland	441,670	480,100	38,430
New South Wales	184,033	203,982	19,949
Totals	2,520,210	2,792,943	272,733

At this rate, the full calendar year is expected to show a total increase in value of £1,500,000.

New South Wales.

The Broken Hill Proprietary Co. at Broken Hill reports for the four weeks ending December 2 (including product from ores purchased) refinery products were: Fine silver, 467,253 ounces; soft lead, 5075 tons; antimonial lead (estimated), 60 tons.——The Broken Hill Water Supply Co., November 30, reports 193 points of rain fallen at Broken Hill, and the reservoir rose 2 feet 10 inches, equal to 1,018,000,000 gallons. This gives a total of 2,293,000,000 gallons.

Queensland.

The Mount Morgan G. Co., at Mount Morgan, under date of Nov. 26, reports diamond drill work as follows: Bore No. 8, vertically above No. 7, at 60 feet, assays average 14 dwts. gold per ton and 3% copper; for 13 feet assays average 7 dwts. gold per ton and 2% copper; stopped. Bore No. 9, at 100 feet, assays average 2 dwts. gold per ton and 2.45% copper; 100 feet, poor; stopped. Vertical holes now being sunk. No. 1, 36 feet, poor country rock; stopped.

South Australia.

The Northern Territories M. & S. Co., under date of December 4, reports that at the Mount Ellison mine they have driven on the lode at the 120-foot level 30 feet during the month of November, making total length of level 130 feet. Ore is being raised. At the Iron Blow mine sinking was resumed on the new main shaft. On the tramway line to Mount Ellison earthworks are completed for 3¼ miles, plate laying and ballasting for 3 miles, and bridges and culverts for 4 miles. At the smelting works the reverberatory furnaces are ready for smelting and the jacket furnace completed. Smelting will start with one reverberatory furnace by December 18. Smelting operations were delayed owing to the heavy rains having soddened the tram line embankments before they were firmly set.

Molybdenite is reported found near Port Lincoln.

Victoria.

The New Chum Railway mine at Bendigo has attained depth of 3900 feet, said to be the deepest in Australia, says the New Zealand Record. At this depth it requires three men to work a rock drill which was operated by two men in the upper levels of the mine. To enable the men to work at the present depth, a stream of water is conveyed from a bulkhead at the 3200-foot level by pipes down the shaft and along the crosscut to within 20 feet of the face. At the end of the piping a spray is fixed, and the water plays on the men as they work at the face, their bodies being thus cooled, the dust kept down, and a current of air created from the shaft.

Western Australia.

The gold exports and mint returns for the eleven months to Dec. 1 are reported as follows:

1903. Period.	Quantity Ounces Exported,	Received at Perth, W. A., Mint. Ounces,	Total Ounces.	Value £
January	101,594	108,857	210,451	757,624
February	80,250	112,148	192,398	692,631
March	78,907	115,816	194,723	701,004
April	86,987	121,640	208,627	751,057
May	92,779	114,722	207,501	747,003
June	72,278	135,781	208,059	742,014
July	90,176	122,325	212,501	765,005
August	82,265	124,352	206,617	743,822
September	71,581	120,824	201,405	725,057
October	72,494	118,291	190,785	686,824
November	75,775	125,399	201,174	724,224
Totals			2,234,241	8,036,265

At the copper mines at Anaconda refining machinery is being put in for the smelter, so that further shipments of matte will not be necessary. The ore is said to average 4½% copper.

The milling plant of fifty head of stamps is in full operation at the Oroya-Brown Hill mine, at Kalgoorlie, and the management expects to treat 7000 tons of ore monthly. They will reduce the grade of ore so as to yield 30 dwt. of fine gold per ton, to permit all ore of a payable character met with in the course of mining to be extracted and treated, and also allow the monthly fine gold yield of 1050 ounces to be maintained, says the Government Journal.

ARGENTINE.

Important mineral discoveries are reported made at Agua Caliente, Provence of La Rioja. The ore carries gold, silver, tin and copper.

BRITISH COLUMBIA.

Boundary District.

Manager Pemberton of the Montreal & Boston C. Co., operating the smelter at Boundary Falls, says the smelter will continue to be run at full capacity of two furnaces this winter and another furnace will be added in the spring.

It is reported that the Granby C. Co., at its smelter at Grand Forks, last week, began surveys for six additional copper furnaces, which will give them a total of twelve furnaces.

The Snowshoe group of mines at Phoenix, after steady development for five years, has arrived at the point where it is necessary to own a smelter or an interest in one, says Manager A. J. McMillan of Rossland. It has been decided to cease shipments from the mine to customs smelters pending permanent smelting arrangements. Superintendent J. W. Astley has suspended operations temporarily. The Snowshoe has a large amount of ore blocked out, and also considerable tonnage broken down ready for removal and shipment to a smelter.

Rossland District.

The White Bear M. Co. has bought for construction of its proposed 100-ton oil process concentrator within the city limits in preference to selecting a millsite outside. The millsite selected is east of the new shafthouse, south of Kootenay avenue. Arrangements are being made for water supply, for building a tramway, etc.

Vancouver Island.

The Wellington Colliery Co. reports opening additional coal bodies in No. 7 mine at Cumberland, where it has been driving a slope for several months, encountering difficulties with water and quicksand. It has struck a 7-foot seam of hard coal which burns well. The development of the coal will be rushed. The water is under control. There are three shifts at work.

The Tyee C. Co., at Ladysmith, reports smelting results for twenty-nine days of November: Tyee ore, 4830 tons; customs ore, 1510 tons; total, 6340 tons; matte produced from same, 700 tons; gross value of contents (copper, silver and gold), after allowing for costs of refining and purchase of customs ore, were $65,735. The smelter is shut down temporarily for the usual repairs and until the completion of the aerial ropeway.

CANADA.

Ontario.

A consolidation is reported of mining properties in the Sturgeon lake section, near Wahigoou, to have been effected, and the Northern Light M. & M. Co. organized, to operate the mines. The new company will control seven groups, comprising 657 acres, which were owned by Port Arthur, Duluth and West Superior men. The mines have all been explored and show free milling ore.

GERMANY.

The association of German manufacturers of iron and steel places the production of "raw" iron of the German Empire, Luxemburg included, for month of September, 1903, at 327,298 metric tons, of which 37,799 tons were cast iron, 271,445 tons Thomas iron, and 18,054 tons puddled iron, writes United States Consul-General R. Guenther, at Frankfort. This production is 4.18% less than in preceding month, which was 341,583 tons. In September, 1902, the total production was 291,997 tons. The total production of the works comprised in said association for the first nine months of 1903 was 2,924,293 tons, against 2,465,185 tons for the corresponding period of 1902.

JAPAN.

The Department of Finance has published a report showing the following table of the production of the chief minerals produced in Japan in the years 1899-1901:

	1899.	1900.	1901.
Gold—momme	446,716	566,535	660,653
Silver—momme	14,978,060	15,681,595	14,598,749
Copper—kin	40,459,709	42,183,353	45,052,927
Iron—kwan	6,151,033	6,624,447	18,680,043
Antimony—kin	1,568,462	616,477	911,462
Manganese—kin	18,803,440	26,381,526	27,115,884
Coal—tons	6,721,798	7,429,457	8,945,930
Petroleum—koku	474,406	767,092	983,790
Sulphur—kin	17,062,186	24,064,196	27,580,478

Kwan = 1000 momme = 8.267 pounds avoirdupois. Kin = 1.325 pounds avoirdupois. Koku = 39.7 gallons.

JAVA.

Near Tjilatjap, on the coast of the island, extensive deposits of magnetic iron sand are reported to have been found. The deposits begin opposite the island of Noesa Kembangan and extend 29 miles to the east along the coast line. The sand lies on the surface and is said to contain in places a high percentage of iron. Samples taken have given good results when smelted. An English company has acquired the right of exploiting these deposits, which have been known since 1854.

MALAY PENINSULA.

The Pahang Corporation at Pahang reports returns for the month of October: In twenty-nine days 2700 tons of ore crushed, producing fifty tons of black tin, with fifty stamps running. The working costs were $29,500.——The Pahang Kabang Co. October returns were: In twenty-nine days, 620 tons of ore were crushed, producing fifteen and one-half tons of black tin, with ten stamps dropping. Working costs, $8,250.

The Perak Pioneer says: The total quantity of tin and tin ore exported from Perak, Selangor and Negri Sembilan for the first nine months of 1903, amounted to 601,344 pikuls, which represent an increase of 38,230 pikuls (2,270 tons) as compared with the corresponding period of 1902. The duty realized thereon was $7,244,942, which shows an increase of $1,141,059 over that of the same period in 1902.

MEXICO.

U. S. Consul J. A. LeRoy, at Durango, writes that during the past ten years imports of coal and coke from the United States to Mexico have increased rapidly, owing to the extension of railroads and the industrial development of the country. It is thought, however, that these imports, while they may continue to gain in actual value on account of such development, will show a relative decline. One of the subcommissions of the Mexican monetary conference has reported the annual production of coal and coke in Mexico amounts to 1,000,000 tons, and that, at the present rate of increase, this production will be doubled by 1905. The Mexican National Iron & Steel Co., an American company, which is exploiting the "iron mountain" at Durango, gets all its coke from Sabinas district, in State of Coahuila, where three-fourths of the Mexican output of coal and coke is produced. The price paid for coke at Durango is $7 to $10 per ton.

Chihuahua.

E. M. Alpangh of Los Angeles, Cal., of the Santa Maria & Parral M. Co., reports work going ahead at their group in Dallerza mining district, 30 miles from Parral. Pay ore was discovered at the grass roots and a shaft has been sunk on the ore body for 100 feet. The vein is 9 feet in width and averaging $20 in lead-silver values. There is ample supply of timber on the ground, an abundance of water, and a wagon road from the mines to the railroad, a distance of 25 miles. There are forty pertenencias in the group. The company also own the Porte Rican gold property in the State of Durango. Machinery will be put in at both mines.

Preparations are said to be under way for metallurgical works and smelters by Senor Becerra at El Potrero, on the left bank of the Urique river, in municipality of Urique, under a concession granted by the Government. The concession gives him the right to use the waters of the river for motive power.

H. I. Smith and F. I. Davison of Boston, Mass., G. H. Davis and G. W. Boyce, have bought the Campo Vieje silver-lead mine, in Terrazas camp, 25 miles north of Chihuahua, and one mile from the main line of the Mexican Central railroad. The Campo Viejo is said to be on the same vein as the Americana mine, which is producing 150 tons per day, yielding forty ounces of silver per ton and 20% lead.

The Mines Companies Ltd. of Boston, Mass., is being organized to operate the Campo Viejo. Several shafts will be sunk. Work will be started this week on shaft No. 1, where a steam hoist will be put in. G. W. Boyce is superintendent.

The output of the Palmillo mine, at Parral, is said to be $100,000 per day, reports the Mexican Investor. On the 700-foot level the vein is 40 feet wide. The new shaft, which is down 700 feet, is equipped with an electric hoist, having a capacity for raising 1500 tons of ore per day from a depth of 2500 feet. Work is progressing on the Capusaya group which adjoins the Palmillo mine. It is being operated by the Mexican M. & Exp. Co., with H. G. Catlin as manager. The Guaynopa S. & R. Co., operating in Guerrero district, proposes to build a power plant on the Guaynopa river. The smelting plant of this company is in operation.——In the Arteaga district, the Guazapares M. & M. Co. is pushing work on its properties 45 kilometers east from Chinipas. Development work totals 4300 feet, and the group is equipped with mill, leaching plant, etc.

L. Marks, interested in the Laverona mines, near the Dolores mine, near Terrazas, has bought thirty pertenencias of ground adjoining the Laverona, said to be for $100,000 gold. The vein is 6 feet wide and averages $30 per ton, mostly free milling.

L. Marks, interested with J. W. Pender in the Laverona mines, near the Dolores, near Terrazas, has bought thirty pertenencias adjoining the Delores. The Enterprise says, through an erreneous survey, the shaft which was supposed to be on the Laverona was found by a resurvey to be on the property bought by Marks. The vein is 6 feet wide and averages $30 per ton, mostly free milling.

Durango.

The Huahuapan M. Co., which has re-

sumed operations, is increasing development work on its group, near Huahuapan, in San Dimas district. The ore carries values in silver,——La Cong mine, near Inde district, is said to be shipping 200 tons per month of ore, which runs 800 ounces silver, and 0.3 ounce gold per ton, and 10% lead. The Portilla mine, in the same district, is shipping 200 tons of ore per month. In the Santiago Papasquiaro district, the Bacis G. & S. M., Ltd., is pushing work on its properties. The ore carries silver and gold and runs $30 per ton. Equipment consists of a 30-stamp mill, one roller mill, concentrators, etc., operated by water power. Development consists of twelve tunnels, with crosscuts, drifts, etc., the total being over 14,500 feet.

Personal.

J. A. MURRAY of Butte, Mont., is in San Francisco, Cal.

GEO. B. EARNSHAW of Nogales, Arizona, is visiting California.

G. JOHNSTON is manager of the Blaney Oil & Gas Co., near Florence, Colo.

ERNEST STEIN goes as assayer in the new mill at Guanacevi, Mexico.

D. M. MUNRO of San Francisco, Cal., has gone to Rosario, Sinaloa, Mexico.

W. H. MITCHELL of Salt Lake City, Utah, is in San Francisco, Cal., on business.

E. A. H. TAYS, Fuerte, Sinaloa, is in the City of Mexico on professional business.

H. VINCENT WALLACE of Altar, Mexico, is on a three months' visit to London, Eng.

J. J. DALY of Salt Lake City, Utah, of the Daly-West M. Co., is in San Francisco, Cal.

H. C. HOLTHOFF, president of the Holthoff Machinery Co., Cudahy, Wis., is visiting Denver, Colo.

C. O. POOLE, with Hendrie & Bolthoff Mfg. & Supply Co. of Denver, Colo., is in San Francisco, Cal.

A. C. PRATT is superintendent of the Monte Cristo mine near Sweetwater, Esmeralda county, Nev.

D. T. PARKER of Parker & Jamison, Denver, Colo., is examining mining property at Leadville, Colo.

B. H. TATEM of Helena, Mont., is president and manager of the Oro Hondo mine, near Deadwood, S. D.

S. A. HARSH has returned to Denver, Colo., from New Mexico, where he has been for several months past.

SUPERINTENDENT MITCHELL of the Castle Peak mines, near Bodie, Cal., is in Denver, Colo., for the winter.

F. COGILL of London, Eng., has gone to the Gold Coast, West Africa, as secretary for mines of the Gold Coast.

M. MANLEY, superintendent of the Enterprise mines in Trinity county, has gone to Boston, Mass., on mining business.

JOHN T. MILLIKIN, superintendent of the Imperial mill, Deadwood, S. D., is spending the holidays in Denver, Colo.

E. C. ALLEN of Portland, Or., is superintendent of the Black Butte M. Co., operating in Fox valley, Grant county, Or.

R. DE LARGE of Dewey, Ariz., is constructing engineer on the Tonto basin dam, near Livingstone, Gila county, Ariz.

MANAGER PEMBERTON of the Montreal & Boston C. Co., at Boundary Falls, B. C., returned last week from a business trip East.

R. HARRIS, a mining engineer formerly in the Kootenays, B. C., has returned to London, England, from a trip to Rossland, B. C.

J. ADAMI, assayer at the Wallace sampler of the Federal M. & S. Co., Wallace, Idaho, has been appointed superintendent of the plant.

THOMAS J. BARBOUR, chief engineer of the Risdon Iron Works, has returned to San Francisco, Cal., from a several weeks' visit to New York.

W. F. DETERT of Jackson, Cal., president and manager of the Argonaut M. Co., made a business trip to San Francisco, Cal., this week.

SUPERINTENDENT HAMPTON of the Oneida mine, north of Jackson, Amador county, Cal., has returned to Jackson from San Francisco, Cal.

T. S. DAYTON, resident manager of the Mexico Mine & Smelter Supply Co., has returned to Mexico City from a trip to New York, N. Y., and Denver, Colo.

W. R. FELDTMANN of London, Eng., is consulting engineer for the Wassau (Gold Coast) M. Co., Ltd., and for the Gold Coast Amalgamated Mines, Ltd., West Africa.

J. H. TIBBITS of Redding, Cal., for the past eight months superintendent of the smelting works at Marfa, Texas, is at Sutter Creek, Cal., and will go to St. Louis, Mo., next month.

T. BUTEMENT, formerly manager of the Princess Royal mine, at Cue, Western Australia, and recently in charge of the Field's Find, is assistant director of the School of Mines at Kalgoorlie, Western Australia.

F. W. BRADLEY of San Francisco, Cal., president of the Bunker Hill & Sullivan M. & Concentrating Co. of Wardner, Idaho, has returned to San Francisco from a trip to New York and an extended visit to mines in the Northwest.

H. CLAGETT, recently superintendent of the Wallace (Idaho) sampler of the Federal M. & S. Co., is with the Hecla M. Co. of Burke, Idaho. He left for Salida, Colo., last week to represent the company at the smelter where its ores are being treated.

KIKEI NISHIKAWAR, chief engineer of the Bessi Copper Co. of Tokio, Japan, operating copper mines in Japan, is in San Francisco, Cal. He will visit the principal copper camps of the United States to inspect the American methods of mining and smelting copper ore.

R. G. WILSON of Salt Lake City, Utah, president of the New York Bonanza mine, at Park City, Utah, returned last week from an extended trip through the East and South, in the course of which he inspected some of the iron prospects of northeastern Texas, near the Indian Territory line.

Commercial Paragraphs.

FROM Jas. L. Robertson & Sons, 204 Fulton street, New York, N. Y., is received a clever little lock bill file that serves a useful purpose, and incidentally advertises their Eureka packing. The bill file will be sent anywhere on request.

"WE PULL FOR LESCHENS" is what one reads on the large leather collars of the horses attached to the wagons of A. Leschen & Sons Rope Co., in St. Louis, New York, Chicago and Denver. These are the wagons in which they deliver their reels and coils of Hercules and patent flattened strand and all other kinds of wire rope. A. Leschen & Sons Rope Co. also manufacture and erect aerial wire rope tramways of every description; likewise underground and surface wire rope haulage plants, with experienced engineers in charge of the different departments. The home office of A. Leschen & Sons Rope Co. is 920-932 North First St., St. Louis, Mo.

Books Received.

"The Factory Manager and Accountant" is the title of a new work by Horace L. Arnold—a book of practical cost keeping. The blanks and forms appearing in the book are reproductions of actual pages, and these forms can be suited to any kind of manufacturing business and also to mining, in which industry the keeping of accurate cost sheets has become a necessity. The methods of successful managers are incorporated in this volume, and any manager not fully satisfied with his own methods may find in this new publication something that will assist him to evolve just what he wants; 432 pages, 6x9 inches; illustrated; cloth binding. Price, $5. The Engineering Magazine, 120 Liberty St., New York City, and 222 Strand, London, W. C.

Obituary.

J. POWNING, a pioneer mining man of the Comstock in Nevada and of Grass Valley, Cal., died at Grass Valley on the 11th inst.

W. C. HARRINGTON, a pioneer mining man of Eureka, Nev., died in Eureka on the 8th inst. Deceased was a native of Vermont, 79 years of age. In 1869 he was foreman of the Jackson mine, in Eureka district, and later was owner of several claims on Peelstick hill.

J. M. JOHNSON, a pioneer miner and millman of California, died at Grass Valley, Cal., on the 12th inst. from consumption. Deceased was a native of Morgan, Indiana, 73 years of age, and went to California in 1850 and mined in Amador, Placer and Nevada counties.

Latest Market Reports.

SAN FRANCISCO, December 24, 1903.

METALS.

SILVER.—Per oz., Troy: London, 27½d (standard ounce, 925 fine); New York, bar silver, 55⅝c, refined (1000 fine); San Francisco, 55⅝c; Mexican dollars, 43@45c San Francisco, 42⅜c New York.

COPPER. — New York: Standard, $12.37½; Lake, 1 to 3 casks, $12.37½; Electrolytic, 1 to 3 casks, $12.25; Casting, 1 to 3 casks, $12.12½; San Francisco: $15.00. Mill copper plates, $17.00; bars, 18@24c. London: £56 15d spot per ton.

Copper has remained unchanged in New York during the past week, but made a slight advance in London, with somewhat higher price for future delivery.

LEAD. — New York, $4.37½; Salt Lake City, $3.50; St. Louis, $4.00; San Francisco, $4.50, carload lots; 4⅜c 1000 to 4000 lbs.; pipe 6½, sheet 7, bar 5¾c; pig, $4.75. London: £11 6s 3d ℔ long ton.

SPELTER.—New York, $5.00; St. Louis, $5.10; London, £21 7s 6d ℔ ton; San Francisco, ton lots, 6¾c; 100-lb. lots, 7c.

TIN.—New York, pig, $28.25 @ 28.50; San Francisco, ton lots, 30c; 500 lbs., 28½c; 200 lbs., 30½c; less, 31c; bar tin, ℔ lb., 30@32c. London, £129.

PLATINUM. — San Francisco, crude, $18.00 ℔ oz.; New York, ingot, $19.00 ℔ Troy oz. Platinum ware, 75 @ 82c ℔ gram.

QUICKSILVER. — New York, $46.50@47.00, large lots; London, £8 7s 6d; San Francisco, local, $44@44.50 ℔ flask of 76½ lbs.; Denver, $48.00. Export, $42.00@42.50.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 31½c; Eclipse, 35c.

SOLDER. — Half-and-half, 100-lb. lots, 18.75c; San Francisco, Plumbers', 100-lb. lots, 15.75c.

ZINC.—Metallic, chemically pure, ℔ lb., 50c; dust, ℔ lb., 10c; sulphate, ℔ lb., .04c.

NICKEL.—New York, 50@60c ℔ lb.; ton lots, 40@47c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30@34c.

LUMBER. — (Retail): Pine, ordinary sizes, $24.00@25.00; extra sizes higher; redwood, $28.00@30.00; lath, 4 feet, $4.50 @5.00; pickets, $21.00; shingles, $2.50 for No. 1 and $2.25 for No. 2; shakes, $13.50 for split and $15.00 for sawed; rustic, $28.00 @35.00.

NAILS.—Per keg (list prices): No. 20d to 60d, Wire, $3.35; Cut, $3.55; 10d to 16d, Wire, $3.45; Cut, $3.35; 8d Wire, $3.50; Cut, $3.50; 6d and 7d, Wire, $3.60; Cut, $3.60; 4 and 5d, Wire, $3.70; Cut, $3.70; 3d, Wire, $3.85; Cut, $3.85; 2d, Wire, $4.10; Cut, $4.10. Special rates for carload lots.

LIME.—Santa Cruz, $1.60 country, $1.75 city ℔ bbl.

CEMENT.—Imported, $2.50@2.75 ℔ bbl.; California carload lots, $2.25 f. o. b. at works; small lots, $2.50 ℔ bbl. in sacks, 4 sacks to bbl.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, $14.00 @14.35; gray forge, $12.35; San Francisco, bar, 3c ℔ lb., 3¼c in small quantities.

STEEL. — Bessemer billets, Pittsburg, $23.00@23.00; open hearth billets, $23.00 @23.00; San Francisco, bar, 7c to 12c ℔ lb.

GENERAL SUPPLIES.

ANTIMONY. — New York, Cookson's, 7½c; Hallett's, 6¾c; San Francisco, 1000-lb. lots, 8c; 300@500-lbs., 8½c; 100-lb. lots, 10½c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2.00 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x $8; Lion, $9, in lots not less than 1000.

FUSE. —Triple tape, $3.60 per 1000 feet; double tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11½c ℔ set; 14 oz., 40s., 10c.

CHEMICALS. — Cyanide of potassium, 98%-99%, jobbing, 23@24c ℔ lb.; carloads, 23@23½c; in tins, 30c; soda ash, $2.00 ℔ 100 lbs.; hyposulphite of soda, 3@3½c per lb.; caustic soda, in drums, 3@3½c ℔ lb.; Cal. s. soda, bbls., $1.20@1.40 ℔ 100 lbs.; sks., $1.05; chlorate of potash, 12@13c; nitrate of potash, bbls., 10c; caustic potash, 10c in 40-lb. tins; roll sulphur, 2½@2¾c; powdered sulphur, 2@3c; flour sulphur, French, 3½@3¾c; alum, $2.00@2.25; California refined, 1¾@2c; sulphide of iron, 8c ℔ lb.; copper sulphate, 5½@5¾c; chloride of lime, spot, $2.50@2.75; sulphuric acid, in carboys, 66% B, 1¾@2c ℔ lb.; nitric acid, carboys, 8c ℔ lb.

BONE ASH.—Extra No. 1, 5@6c ℔ lb. No. 1, 4@5c.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 6½c; less than 500 lbs., per lb., 7c; in 25-lb. tin pails, ¼c ℔ lb. above keg price; in 1 and 5-lb tin cans, 100 lbs. per case, ½c. per lb. above keg price. Dry Lead—In bbls., 1 ton and over, 6½c; do. in kegs, 7c.

RED LEAD.—500 lbs. and over at one purchase, ℔ lb., 6½c; less than 500 lbs., 7c.

LITHARGE.—Pure, in 25-lb. bags, 8@9c ℔ lb.

BORAX.—Concentrated, 6@7c ℔ lb; powdered, 8@10c; fused, 20@25c; crystal, 7c; calcined, 25c.

MANGANESE.—Pure, ℔ lb., 60c.

SODIUM.—Metal, ℔ lb., $1.00.

BISMUTH.—Subnitrate, ℔ lb., $1.75.

MERCURY.—Bichloride, ℔ lb., 90c.

MOLYBDENUM.—$2.00 ℔ lb.

CHROMIUM.—90% and over, ℔ lb., $1.00.

PHOSPHORUS.—American, ℔ lb., 75c.

SILVER.—Chloride, ℔ oz., 90c@$1.00; nitrate, 55c.

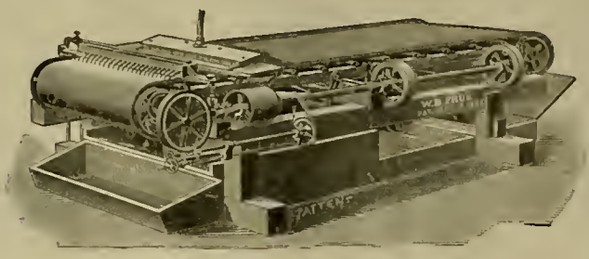
ALUMINUM.—No. 1., 99%, small lots, 37c ℔ lb.; 100 lbs., 35c; 1000 lbs, 34c; ton lots and over, 33c, Pittsburg. No. 2, 90%, small lots, 34c; ton lots and over, 31c, Pittsburg.

URANIUM.—Oxide, ℔ lb., $3.50.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific Coast inventors:



FOR THE WEEK ENDING DECEMBER 15, 1903.

747,113.—HOISTING APPARATUS—C. J. Allen, S. F.
747,116.—LOCK—W. Amstalden, Amador City, Cal.
747,291.—PROCESS—D. M. Balch, Coronado, Cal.
747,119.—HANGER—H. Barry, S. F.
746,914.—VAPOR GENERATOR—F. H. Bates, S. F.
747,120.—BUILDING CONSTRUCTION—J. W. Beaumont, Los Angeles, Cal.
746,662.—CAN HEADER—Black & Smith, S. F.
747,037.—RAIL JOINT—R. C. Bott, Grouse, Or.
747,298.—CLUTCH—T. Carroll, Anaheim, Cal.
747,136.—HAILROAD RAIL FASTENER—C. G. Chamberlain, Pacific Grove, Cal.
746,790.—FOWL FOTNTAIN—S. H. Church, Los Angeles, Cal.
747,145.—HAND HOLD—G. W. Covington, Emeryville, Cal.
746,685.—CATTLE GUARD—Dement & Prendergast, Blaine, Wash.
746,686.—SAW—E. B. Dennison, Eureka, Cal.
747,151.—STEAM COOKER—F. A. Dixon, San Jose, Cal.
747,155.—TROLLEY SWITCH | L, E. Elwell, Los Angeles, Cal.
747,054.—PITMAN—D. W. Fagalde, Douglas, Or.
74g,815.—CAN—D. Ghirardelli, S. F.
746,816.—TRUCK—C. A Goddard, Seattle, Wash.
747,176.—BED BOTTOM—J. Hoey, S. F.
746,842.—BOTTLE—Irwin & Jackson, S. F.
746,720.—PULP REMOVER—H. H. Lyon, Riverside, Cal.
746,982.—SAW SHARPENER — McCauley & Renie, Hoquiam, Cal.
746,977.—RAILROAD SIGNAL—Mills & Piddington, Los Angeles, Cal.
747,225.—RAILROAD SIGNAL—Mills & Piddington, Los Angeles, Cal.
746,869.—PREVENTING SNORING — S. A. Moulton, Campbell, Cal.
747,212.—DISPLAY LIGHT—D. J. O'Brien, S. F.
747,083.—UNDERCUTTER — J. Pierce, Tumwater, Wash.
747,223.—DEEP WELL PUMP—G. C. Richards, Oakland, Cal.
746,880.—CANE—L. R. Robertson, Oakland, Cal.
747,008.—HOSE COUPLING—H. E. Smith, Roslyn, Wash.
746,897.—PENCIL CASE — B. F. Stuart, Seattle, Wash.
747,268.—GOLD SAVING DEVICE—S. C. Szenaaski, S. F.
746,899.—FURNACE—J. Todd, Seattle, Wash.

A GOOD INVESTMENT. $3 BRINGS THIS PAPER One Year, Fifty-two Issues. CAN YOU AFFORD TO BE WITHOUT IT?

The FRUE VANNER with Brownell "PATENT LIP" Flange Belt

stands for everything that is good, desirable and reliable in concentration. The FRUE VANNER is the STANDARD by which ALL OTHER concentrators are judged. If you buy some other concentrator you MAY get satisfactory results. If you buy a FRUE VANNER you are SURE to be satisfied. You get a durable machine of the highest capacity that gives a clean concentrate with the least possible loss in the tailings. The FRUE is furnished with the Brownell "PATENT LIP" FLANGE BELT. This is the best and highest priced

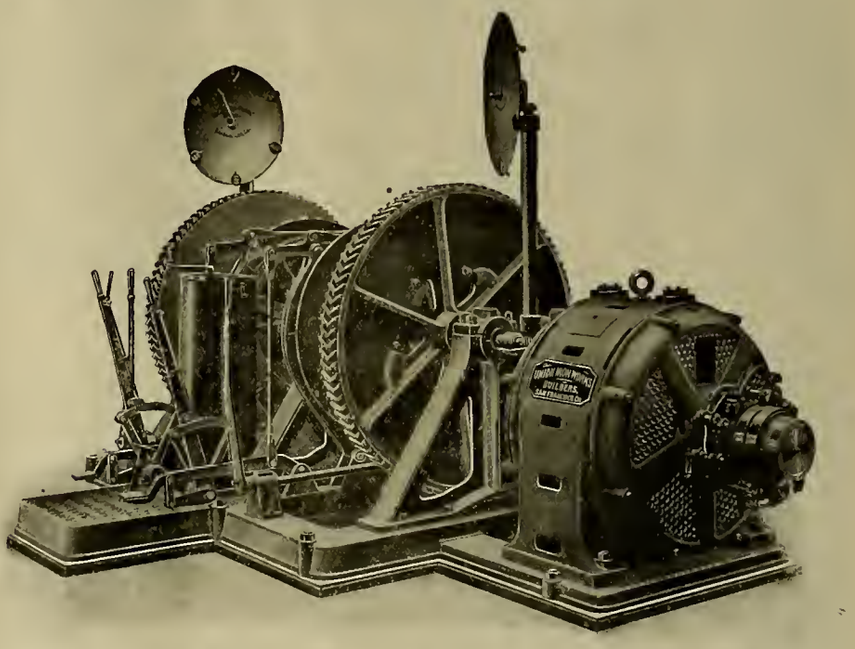
belt on the market. There are over 1700 of them now in use, and we have plenty of testimonials to show that after seven years' constant wear they are still without a break in the flange. All the largest Mining and Milling plants on the Pacific Coast, and in all parts of the world, have adopted them. Machines are made in four and six-foot widths, and furnished with either plain or corrugated belts. We supply either wood or iron carriage frame, as may be desired.

FOR DESCRIPTIVE PAMPHLETS, ADDRESS

JAS. S. BROWNELL, Western Manager FRUE VANNING MACHINE CO.,

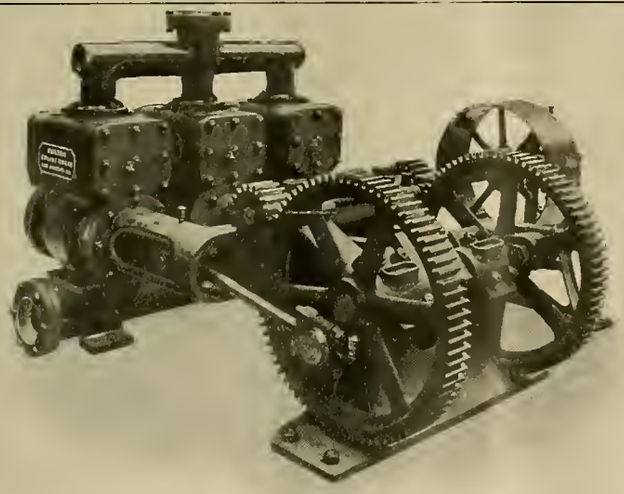
132 MARKET STREET, (Successor to Adams & Carter.) SAN FRANCISCO, CAL.

EFFICIENCY=RELIABILITY



OUR PRODUCTS HAVE AN ENVIABLE REPUTATION FOR EFFICIENCY AND RELIABILITY AND THIS REPUTATION HAS NOT COME TO US BY ACCIDENT.

WE BUILD MACHINERY **ADAPTED** TO THE REQUIRED SERVICE. WE WILL BE PLEASED TO FIGURE WITH YOU ON ANY CLASS OF MACHINERY FOR



MINING, MILLING, POWER, SMELTING,

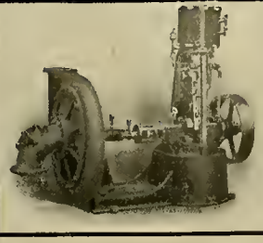
OR ORE TREATMENT IN GENERAL.

UNION IRON WORKS
222 MARKET ST.,
SAN FRANCISCO, CAL.

ELECTRICALLY OPERATED HOIST. CAPACITY, 1000 FT. OF ¾ IN. ROPE AT A SPEED OF 400 FT. PER MIN. LOAD, 6000 LBS.
WE BUILD HOISTS IN VARIOUS SIZES AND TYPES FOR ANY SERVICE.

Fulton Engine Works,

MANUFACTURERS OF



Horizontal and Vertical Power Pumps

FOR EVERY POSSIBLE DUTY.

SINGLE, DUPLEX AND TRIPLEX. LATEST IMPROVED PATTERNS.

STRONG, SIMPLE, EFFICIENT.

Los Angeles, Cal.

High Speed Engines

For Direct Connection to Dynamos, Blowers, Pumps, Etc.

Generating sets furnished complete. Adapted to mines, factories, isolated plants, and marine work. Used in electric drill work.

DIRECT CONNECTED CENTRIFUGAL PUMPING OUTFITS.

ASK FOR CATALOGUE.

OHMEN ENGINE WORKS,

Office: 132 Main St. San Francisco, Cal.

FILTER PRESSES

Vajen-Bader Co 228
Value of Mineral Land 34
Of Mexican Exports 132
Values in Mine Management 85
In Slimes or Coarse 300
In Sluice Concentrates 54
*Valve for Hydraulic Air Compressor 274
*Locke Automatic Shut-off 85
*Mechanism for Rock Drills 189
Valves, Leaky 266
Compressor, Gummed 266
Vanadium 3, 112
Vanadinite 350
Van Drake-Olsen Machine Works 279
Van Meter, J. W 304, 392
*Vaporizer for Explosive Engine 155
Variation of Magnetic Compass 96
*Variations in Construction 109
Vein Croppings, Color of 3
Following Down a 316
Values and Country Rock 18
Walls 316
Veins, Gash 63
And Igneous Rocks 3
*Identity and Continuity of 233, 249, 273
In Placers 366
Thinning Out of 248
Velocity of Objects Floating in Water 52
Venezuela Mines 227
Ventilation 333
By Shafts 215
*Of Deep Levels 238, 250
Ventilating Fans 198
"Vertical" 181
Shaft, Lining Up 79
Victor Engine and Motor Carriage 380
Victoria, Australia, Ballarat District 283
Vindicator Mine, Colo 349
Violence, Result of 78
Virginia City, Nev., Occidental Lode 300
Volatilization of Silver 231
Volcanic Ash 165

W

Wages of Coal Miners in Bohemia 154
Wages of Miners 118
Walling Water Ditches 248
Wall ocks, Analyses of 243
Walls of Veins 316
*Washer for Ore 70
"Beach" 401
*Washing Gold, Machine for 136
Washington Mines ..... 13, 30, 44, 58, 74, 91, 106, 107, 133, 140, 158, 176, 193, 210, 225, 245, 261, 278, 295, 311, 328, 345, 361, 378, 397, 411, 429.
Court Decision 417
Washoe Process 231
Waste, Breaking of, at Broken Hill 111
As Filling in Mines 417
Watch Dial, as Compass 49
*Water, Application of in Rock Drilling 152
California Case 385
Capacity of Pipe 147
*Conserving for Hydraulic Mining 399, 402
Discharge of 128
Discharge of from Nozzle 96
Dividing 266
Famine 315
Flow in Pipe 417
Flow of Yosemite Falls 118
Flume for in Tunnel 333
For Concentration 333
For Milling 333
"Hammer" in Steam Pipe 215
Heaters, Use of 3
Horse Power of 147
In Shafts 383
In Stamp Battery 63
Lifting by Compressed Air 165
*Nozzles for Impact Water Wheels 6
On Belt Concentrators 147
Pipes in Gasoline Engines 79
Power 19, 63, 417
Power, Development of 337
Power in South Africa 237
Pressure 383, 417
Rights 96
Tanks 266
Temperature of 164
Uniform Measurement of 314
Velocity of Objects Floating in 52
Wheels, Impact 111
*Wheels, Overshot 231
*Wheels, Tangential, Efficiencies of 84
Wear on Running Rope 63
Weight of Conical Pile of Ore 300
Of Air 417
Of Rails for Mine Cars 231
*Weinland Mechanical Cleaner 6
*Weirs, Pipes, Etc., Data on 36
Welding Iron and Steel 147
Wellman-Seaver-Morgan Co 346
Western Federation of Miners 111, 349
Supply Co 245
Westinghouse Electric & Mfg. Co 195
West Virginia Mines 30
"Wet" Ore 383
Versus Dry Crushing 48
Wheelbarrows, Tramming with 316
Wheels, Flat, Remedy for 266
Peripheral Speed of 350
Width of Belts 198
Wilfley Ore Concentrator Syndicate, Ltd 178
*Slimes Table 202
*Windings of Dynamos and Motors 301
Windlass 35
Wire Gauge 248
Wisconsin Mines 71
Zinc Field 386
Witwatersrand Banket 63
Duty per Stamp 3
Hoisting Problems on 372
Ore Grades in 113
Wolframite 417
Woodward Governor Co 381
Wood Working Shops, Exhaust System for 147
Woolley Foundry & Machine Works 195
Working Costs 179
Miner, Experiences of 114
Workingmen's Wages 62
Worthington Pump Co 263
Wyomingite 63
Wyoming Mines ..... 13, 44, 58, 91, 107, 123, 140, 159, 176, 193, 210, 244, 261, 295, 311, 328, 345, 361, 378, 397, 412, 430.

Y

Yavapai Co., Ariz., Injunction Against Western Federation of Miners 349
*Ybarra Mines of Lower Cal 348, 351
Yeatman, John A. & Co 93, 159, 398
Yellow Aster, Mining at 405
Ymir, B. C., Cyanide Plant 253, 271
Yosemite Falls, Water Flow Over 118
Park, Cal., Ditch in 365
Yuba River, Cal., Barriers 365
Yukon Basin, Prospects in 18
*Territory, Alsek Placer District 370
Yuma, Ariz., Colorado River at 19

Z

Zinc Consumption in Cyanide Plants ..... 287, 302, 318, 336.
Determination of 316
Effect of Temperature 3
Electro-Metallurgical Production of 128
Field, a New 386
Metallic 96
Ore Shipments 147
Ores, Reduction of 8
Precipitation of Gold from Cyanide Solution by 316
Prices, and the Missouri Mine and Mill Operators 314, 365
Process of Extraction 239
Production in U. S 79
Slimes, Lead Smelting of 181
*Sulphides, Extraction of from Ores 102
Use of in Desilverizing Lead 251
Zone of Mineralization 19
Twenty-League, in Mexico 417
